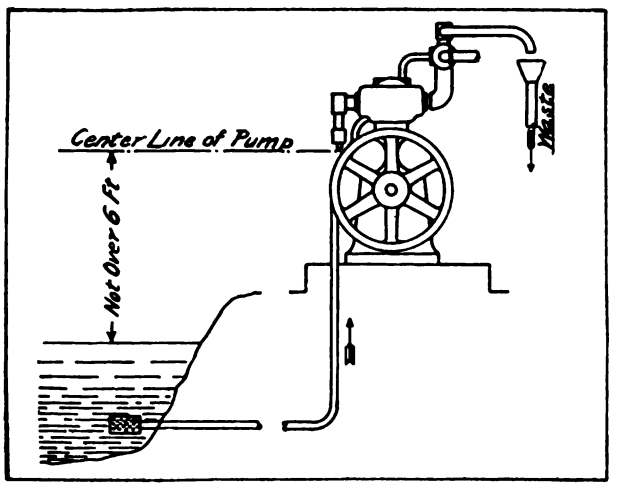
As these small power plants are installed beyond the limits of the central station and expert attendance, it is important that the materials be of the very best quality, and the design, simple. The motors built by the General Electric Company are accurate in design and standardization, being constructed in accordance with the best engineering judgment and highest mechanical skill at the service of this company. Years of experience in producing gasoline motors and generators for railroad service on rural lines and for government service, have been reflected in the result, and absolute reliability and simplicity are features emphasized.



Control of Motor Speed.

The lighting engine must operate evenly and smoothly at all loads, for any variation of speed, however slight, will be noted immediately by a flickering of the lights. Variations of speed not easily noted on a speed indicator will appear prominently

Showing Installation of Generating Set in Private Garage, Including Switchboard and Automatic Clock Cut-Out.

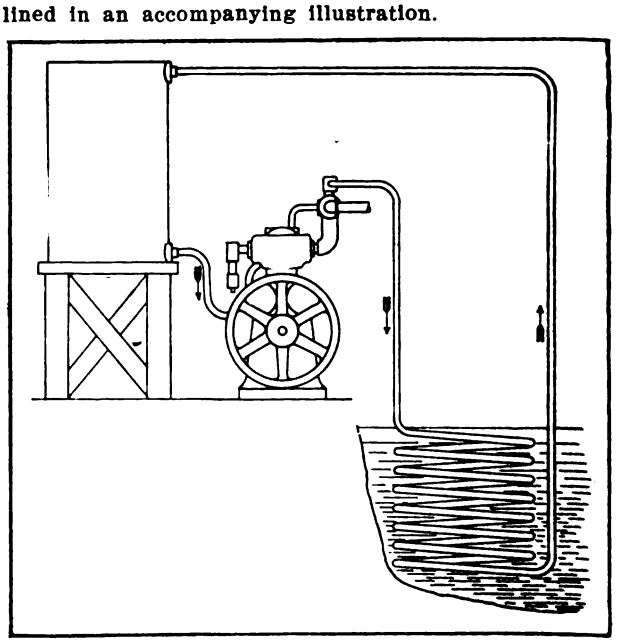
Digitized by Google

Installation of Cooling System Where Water Is Taken from a Lake or Pond.

upon the lamps. To insure steady and even operation the sets are provided with a centrifugal governor, located in the flywheel, this being so constructed that it is very sensitive and capable of responding instantly to changes in loads. It limits the variation in the speed of the motor from no load to full within four per cent. which, with the design of the generator, insures constant voltage.

The four-cylinder motors of the three, five and 10 kilowatt sets are cast en bloc, that of the larger size having cylinders cast singly. The bore and stroke dimensions are 2.5 by five, three by six, five by six and 7.25 by 7.5, respectively, and the speed revolutions a minute are 800, 750, 600 and 560. The cylinders are of a special high grade, close grained, gray iron, carefully machined and ground to size, as are the pistons. The engine base is a substantial one-piece casting, suitably designed for the requirements of the various sizes, and liberal inspection plates permit of easy access to all working parts. The crankshaft is a high grade, specially treated steel forging, accurately ground to size and is supported in two, three or five babbitt bearings according to size of the motor. The camshaft is also of high grade material and the cams are drop forged and pinned. All connecting rods are dropped forged and fitted with removable babbitt filled bearings. All exhaust valves are located on the side, but the position of the intake members is varied, the three and five kilowatt sets being fitted with valves in the head while the larger motors are of the T head type.

Components of Motor.



The carburetor is of the General Electric constant level type to which the fuel is delivered by a pump integral with the engine. The motors are not restricted to the use of gasoline, however, as kerosene, natural or illuminating gas may be utilized, by the substitution of a mixing valve. The 25, 10 and five kilowatt sizes are provided with a General Electric low-tension magneto and induction coil while the three kilowatt is equipped with a high-tension magneto. The intermediate sizes are started directly on the magneto, although batteries may be employed if desired. Forced feed lubrication is employed on the 10 and 25 kilowatt sets, with splash on the smaller sizes, an exception being noted with the one kilowatt, which being of the two-cycle type, is lubricated by mixing the oil with the fuel.

The single-cylinder motor is a two-cycle, three-port type with throttle valve located in the transfer port between the crankcase and cylinder. The same high grade material and workmanship are incorporated in the design and the set has all of the efficient qualities of the larger units. The sets require but little floor space and the generator is mounted directly upon the engine shaft and enclosed in a compact frame.

Cooling Methods Outlined.

All motors are water-cooled and the method of supplying the fluid to the jackets varies according to the location of the unit and available supply of water. The one kilowatt engine is fitted with the thermo-syphon system, utilizing a cooling tank having a capacity of about .80 gallons. Where the amount of water available is limited, the fluid may be cooled by a motor driven blower set forcing air through a gilled tube radiator. This is the standard equipment furnished for the United States army.

Where a constant supply of cold water is to be had the amount essential to cool the motor properly is about seven gallons a minute, when operating the larger set under full load and proportionately less for the smaller outfits. Where the motor is not more than six feet above the level of the water, as in the case of a pond, lake, creek or ocean, the fluid may be lifted directly by the gear pump on the engine and discharged from the jackets into a waste pipe as outlined in an accompanying illustration.

Depicting Method of Cooling Gasoline Motor Generator.

Digitized by Google

Where the height is greater than six feet, an auxiliary motor driven pump may be utilized, or a submerged coil of pipe, the top of which is connected to the discharge pipe on the engine utilized. The lower end of the coil leads to a small expansion tank on a level with the motor, or a trifle above. Another pipe from this container is connected to the gear pump. In this method the height of the engine above the water does not affect the operation of the pump, as it is practically a closed and balanced circulating system. The method of cooling is regulated according to local conditions and the company points out that these cannot be complied with until known.

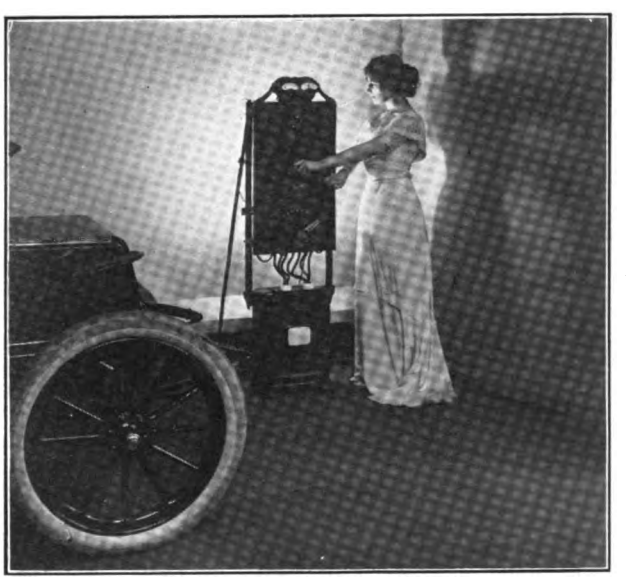
Construction of Generator.

The generator utilized in connection with the motors is a General Electric multi-polar continuous or direct current machine designed especially to meet the requirements of the set. The field winding is compound and compensates for the drop in engine speed between no load and full, thereby maintaining a constant voltage through the entire load range of the set.

The armature of the generator is direct connected to the crankshaft of the gasoline engine and is supported in a ball bearing at the "outboard" end. Continuous current generators of all standard voltages can be furnished and alternating current members for special voltages are made upon special order. The 125-volt direct current generator, however, is considered standard equipment.

Lamp Loads.

The one kilowatt set is capable of supplying a total of 800 candlepower in General Electric Mazda lamps or 40 20 candlepower Mazda lights. The three, five, 10 and 25 kilowatt sizes furnish 2400, 4000, 8000 and 20,000 candlepower, respectively. The Mazda lamps supply approximately three times as much light as the carbon members with the same amount of current, and are important factors in the system, inasmuch as they reduce the power required to one-third.



A large number of these gasoline-electric generating sets have been installed by the company in private garages attached to country estates as well as at the sea shore and in the mountains where current cannot be secured from a central service station. In these days of refinement the city business man is loth to be deprived of the comforts of the city while sojourning at his summer residence and with a generating set the annoying inconveniences, such as poorly lighted houses, inadequate water supply, etc., are eliminated.

Electric motors operated from the generating sets can be utilized to drive domestic and farm appliances contributing to the comfort of the residents. By including a pump in the water circuit a plentiful supply of fluid may be pumped to the storage tank and the level of the latter may be maintained automatically. Motors may also be employed to operate vacuum cleaners, as well as laundry machinery. These sets are capable of supplying adequate current for cooking while a number of devices of surprising utility and variety may be operated throughout the house. These also include heating apparatus.

Charging Apparatus.

The installation of a gasoline-electric set makes possible the utilization of the pleasure or commercial electric vehicle, outside the usual so-called electric field, as with a controlling panel and rheostat the batteries may be provided with energy. The controlling panel is equipped with fused switches, ammeter, voltmeter, and polarity indicating lamps, for controlling one or more circuits as desired. It is also provided with brackets for wall mounting.

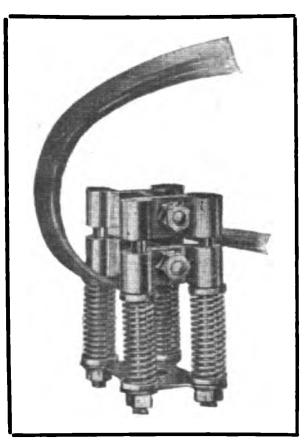
The charging rheostat may be placed under the controlling panel or on the wall adjacent, so as to take up minimum space and insure the utmost convenience in controlling the current. The device is enclosed by an easily removable sheet metal cover, which effectually prevents accidental contact with live

Charging the Electric Vehicle in the Private Garage with Current Supplied by Generating Set.

parts of the circuits. The function of the rheostat is to prevent a heavy rush of current through the batteries when the latter are connected to the source of supply, as well as to regulate the flow of the electricity. The panel is equipped with circuit breaker, fused switch and reliable instruments and is also provided with pipe supports for mounting. With such an arrangement it is claimed that the electric vehicle may be charged easily, the operation involving no labor whatsoever.

Relative to the costs of installation and operation the General Electric Company points out that as with automobiles, so it is with generating sets, the one that can be purchased for the least money is not usually the least expensive in the end. If figured on the basis of dollars a cubic foot occupied or dollars a pound, or even dollars a kilowatt output, the sets are high priced, but on the basis of dollars a unit of relia-

Digitized by Google



bility the prices are no higher than one would expect for an article of this nature. The cost includes all accessories to the generating apparatus but not auxiliary apparatus, such as switchboards, fuel and water tanks, batteries, etc.

In estimating the cost of operation of such a plant the company calls attention to the fact that all items of expense should be considered, such as repairs, cost of attendance, depreciation, cost of suitable building etc., as well as that of fuel and lubricant. The higher the quality of the apparatus, the lower will be the items of repairs and depreciation; the more automatic the operation of the apparatus, the lower the cost of the attendance; and the more compact the design, the less the cost of installation and space occupied.

In figuring the cost of fuel, account should be taken of the fact that any gasoline engine driven set will supply more electrical output a gallon of fuel consumed when operating at its normal rated load, whereas in most cases apparatus of this nature is usually operated at only a fraction of its full capacity. Therefore, a piece of apparatus that will operate at but slight increase of fuel consumption a unit of output and fractional loads, is more economical than one that will consume practically as many gallons of fuel an hour on small as on full loads. The General Electric motors are so designed that a reduction of load results in a definite decrease of fuel consumed, the amount of fuel a kilowatt output increasing but little as the load is reduced.

VELVET AUXILIARY SPRINGS.

Motor car springs which provide comfortable riding qualities on smooth and level highways may jar and jolt the passengers when the machine is operated over rough roads at varying speeds. To eliminate all vibration and shock these stresses must be absorbed in such a manner that there is no recoil.

Velvet Auxiliary Spring.

A device which has been tested and thoroughly tried out is the Velvet auxiliary spring for which George Sumner, Inc., New York City and Boston, is distributor. This differs from the usual form of shock absorber construction inasmuch as the rear of the car is practically suspended by eight elastic coils which are so designed that there is no side sway.

As outlined in an accompanying illustration, it will be noted that two sets of block members are employed, one of these being bolted to each portion of the spring. One set of blocks slides freely up and down on studs over which are fitted the auxiliary springs and a plate is utilized to space the studs properly and to prevent binding.

The lower ends of the stud members are equipped with adjusting nuts, these permitting the regulation of the tension of the springs as desired. It is pointed out by the maker that no violent recoil is possible with the Velvet auxiliary springs as the downward and upward movements are equally compensated. They may be attached easily in a few minutes, as boring or special fittings are not required.

INTERESTING DIXON BOOKLET.

The Joseph Dixon Crucible Company, Jersey City, N. J., importer and manufacturer of graphite lubricants, has issued in booklet form, an interesting essay from the forceful pen of Elbert Hubbard, entitled, "Joseph Dixon, One of the World Makers." Mr. Hubbard refers to Mr. Dixon as "a man whose work has profoundly influenced civilization, yet strangely enough, a man of whom the world at large knows little." The tribute to the founder of the Dixon company is of particular value to those who are familiar with the graphite products made by it. The edition is limited and copies may be had only upon application to the company.

RESULTS AT SALEM, N. H.

J. H. LeCain of Boston, driving a Stutz car, won the 50-mile race at Rockinwgham park, Salem, N. H., June 8, the events being postponed from Memorial Day on account of the weather. Harry F. Grant in a Berkshire car was the only other driver to finish. Seven machines started. LeCain's time was 54:20.2.

Grant's Berkshire won the 20-mile event, finishing ahead of Harry Cobe in a Jackson, in 25:12.8. The 10-mile event was taken by J. F. Esleeck in a Lexington, his time being 10:22.6. John J. Kingsley in a Thomas won the five-mile for amateurs; time, 5:51.8. G. C. Jessop in a Buick took the professional five-mile race; time, 5:37.4.

LENOX ANNUAL MEETING.

At the annual meeting of the board of directors of the Lenox Motor Car Company, Boston, June 3, a vote of thanks was tendered to Frank A. McClasky, the treasurer, for his work as general manager during the past year, and he was unanimously re-elected to that position. Among several important matters which were decided upon were the following: Declaring the regular semi-annual dividend to stockholders of record; the production of a six-cylinder Lenox car for 1913, and the erection of a larger plant. A committee was chosen for the purpose of selecting a site for this factory, and it is hoped that the company will be in its new home by Jan. 1.

Tarvia

Preserves Roads
Prevents Dust~

Connecticut Avenue Bridge, Washington, D. C. Roadway Built with Tarvia X.

The Passing of Plain Macadam

"In these days of progress it is a misdemeanor bordering closely on crime to put an old style macadam pavement on a public road."—*Chicago Tribune.*

WITHIN the last ten years the character of traffic on our roads has changed completely A large part of it is now motor traffic and the wheels instead of simply rolling over the road *tear up the surface.*

The driving wheels of an automobile revolve several more times to the mile than front wheels of the same size, showing the existence of a certain amount of slip, and accounting clearly for the rapid deterioration of brittle macadam surfaces under such traffic.

Deterioration means dust. It also means frequent renewals of the surface at great expense. Obviously, the way to prevent deterioration and to lower maintenance charges is to make the road surface proof against the shearing action of driving wheels.

This can be accomplished by the use of Tarvia, which re-enforces the surface, giving it a plasticity and tenacity which will enable it to resist automobile traffic.

Tarvia was the first bituminous binder on the American market and conforms to universal European experience. It is made in three grades—"Tarvia X" for road and pavement construction, "Tarvia A" for surfacing, "Tarvia B" for dust prevention and road preservation.

Our expert advice is at the disposal of any one interested. Illustrated booklets regarding the Tarvia treatments free on request to nearest office.

CASE AS PATHFINDER.

M. C. Moore and a Case car started June 2 from Milwaukee, Wis., on the pathfinding trip for the annual reliability contest for the Sentinel trophy, under the auspices of the Wisconsin State Automobile Association. The tentative route follows: First day, Milwaukee, Racine, Kenosha, Burlington, Lake Geneva (noon), Elkhorn, Delvanan, Beloit; second day, Beloit, Janesville, Milton, Fort Atkinson, Jefferson, Lake Mills, Madison (noon), Prairie du Sac, Sauk City, Baraboo; third day, Baraboo, Kilbourn, Portage, Rio, Columbus (noon), Beaver Dam, Waupun, Fond du Lac, Oshkosh; fourth day, Oshkosh, Neenah, Menaska, Appleton, New London, Clintonville (noon), Shawnee, Green Bay; fifth day, Green Bay, Kewaunee, Two Rivers, Manitowoc, Sheboygan (noon), Sheboygan Falls, Port Washington, West Bend, Cedarburg, Milwaukee.

MAHIN TAKES LARGER QUARTERS.

The Mahin Advertising Company, Chicago, well known in the automobile and kindred industries, has been forced to secure larger quarters, those previously occupied in the American Trust building, which were engaged in January, 1907, having proved altogether inadequate to take care of the rapidly increasing business of the concern, although an additional floor was secured in 1910. The new offices are in the Monroe building, Michigan avenue and Monroe street, where 50 per cent. more room will be at the disposal of the various departments. The offices of the company are: President, John Lee Mahin; vice president, William H. Rankin; secretary, H. A. Groth.

MAINE ROAD BOOK.

The Maine Automobile Association has issued a neat little book of 48 pages, containing valuable information concerning the roads of that state, as well as the automobile laws. In addition to the text matter, a new and original road map, measuring 15 by 20 inches, accompanies the book. The road mileages are arranged after the manner of a railroad time table, and this plan is expected to meet with decided favor among motorists. The book may be secured by those who contemplate touring in Maine, by addressing Secretary John C. Scates at Westbrook, Me.

CATARACT TIRE GUARANTEED.

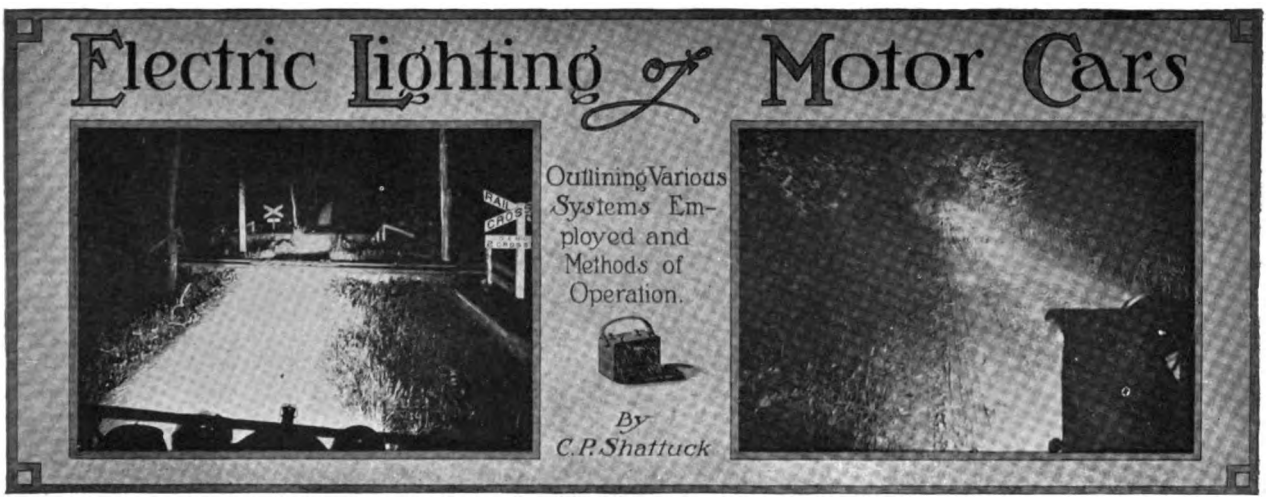
The Cataract Rubber Company, Buffalo, N. Y., which was organized about a year ago, is placing in the market a guaranteed tire, in the production of which a liberal use of the finest Para rubber and selected Sea Island cotton plays a prominent part. The maker has given the Cataract tire every test, and it has been abundantly indicated that the consumer is certain of securing a service of 6000 to 8000 miles. Branch offices have been established in a number of cities, included among which are Boston, Mass., and Providence, R. I. The officers are: President, William J. Bullock; first vice president, Samuel J. Greene; second vice president, George N. Steere; treasurer, Francis M. Adams; secretary, Edwin P. Dodge. The concern is capitalized for $500,000. The manager of the Boston branch, which is located at 1002 Boylston street, is I. C. Emery.

CHURCHWARD ADDRESSES Y. M. C. A.

Alexander Churchward, consulting engineer for Gray & Davis, Amesbury and Boston, Mass., maker of Gray & Davis lighting systems, gave an illustrated lecture on the subject of "Lighting the Motor Car by Electricity," before the Boston Y. M. C. A. automobile school, May 24. In order to present the subject in a thorough and comprehensive manner, an 1913 Peerless car, fully equipped with Gray & Davis lighting dynamo, was utilized. This lecture was a special event, although forming a portion of the regular course for this school.

HOPEWELL BROS. BRING SUIT.

Alleging infringement of its patents covering the construction of the Hopewell tire cases, granted to E. B. Hopewell and A. H. Kinder, the Hopewell Bros., Newton, Mass., has brought suit against the Linscott Supply Company, Boston, for selling spiral spring tire cases.



BUILD ROAD FOR TOUR.

Public-spirited citizens in the northern part of Arizona have just finished building a stretch of road, over 70 miles in length, for the especial use of an automobile tour, which will traverse country heretofore accessible only to pack animals. When this contest was first suggested, it was the intention of men in Phoenix to drive their cars to Grand Canyon by a rough route, following the lines of the Santa Fe railroad. The citizens of Ash Fork objected, realizing that their town was missing a fine chance of showing itself to advantage.

Accordingly, a committee of Ash Fork citizens told the Phoenix people that they would guarantee a more direct route by way of that town. They commenced work with pick and shovel, meeting a similarly public-spirited party of road builders from Grand Canyon, who had laid out the second half of the trail.

The tour, for which the road was built, is the first of its kind, including as it does, over 60 Studebaker cars, nearly all of which are owned in Phoenix, the Arizona metropolis. People over the entire state are becoming enthusiastic over the arrangements, however, and owners of E-M-F and Flanders cars, living in other cities than Phoenix have asked for an opportunity to join the party.

Part IX—The Deaco System.

COMBINING the functions of a dynamo and magneto, the Deaco made by the Detroit Electric Appliance Company, Detroit, will appeal to motorists who desire a lighting system which is compact and simple, and easily installed. The dynamo is self-contained; that is, the device regulating the current is located within the housing of the instrument which is operated at the same speed as the crankshaft of the gasoline motor. The other components of the system include the usual switch, storage battery, lamps and wiring.

The Deaco dynamo was designed by expert electrical engineers who have had many years experience in the construction and application of magnetos and dynamos and after much experimentation and elaborate tests the present device was placed upon the market and adopted as standard equipment by several manufacturers of pleasure automobiles. The features and advantages emphasized of the system are: Simplicity, operation at very low speeds, high efficiency, positive service irrespective of condition of battery and impossibility of burning out.

Compactness a Feature.

The dynamo utilized for electric lighting only is very compact, being 10 inches long, 6.125 wide and 7.375 high. Its weight complete with regulator, etc., is 35 pounds. It has two fields, a permanent magnetic and an electro-magnetic. Three compound horseshoe magnets of a high grade German material form the permanent pole pieces. Auxiliary fields are mounted upon these magnets as depicted at Fig. 58, illustrating the Deaco combined magneto and dynamo which will be described in sequence.

The armature is of the drum wound type and the sizes and amount of wire are so figured that no energy is lost through heat, as the Deaco is guaranteed against burning out. The armature shaft is of liberal dimensions and rotates in high grade ball bearings mounted at each end of the shaft. Drive may be by silent chain, gears or belt and both the lighting dynamo and combined dynamo and magneto may be driven either clockwise or anti-clockwise, according to the design of the power plant of the motor car on which it is installed. When the design with the magneto ignition system is utilized, it is essential that the drive be positive in order to provide for accurate timing.

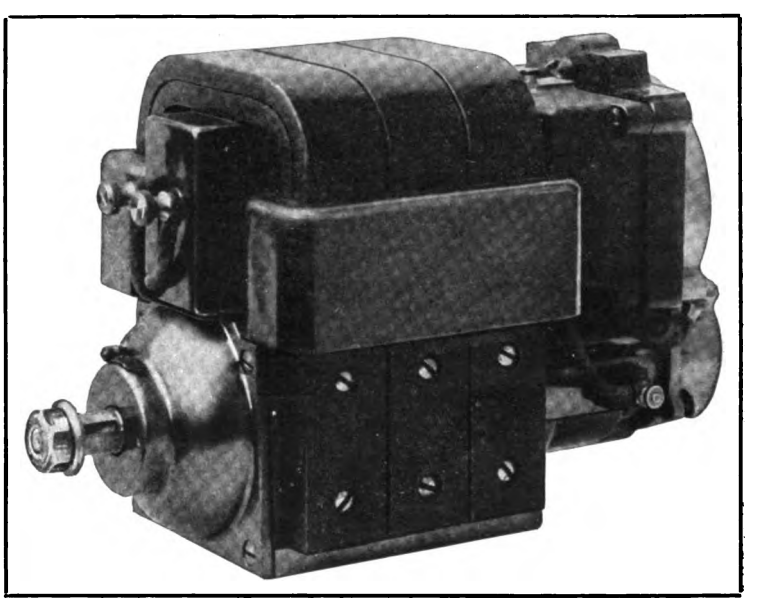

Fig. 58—Deaco Dynamo-Magneto, Which Operates at Motor Speed and Which Is Noticeable for Simplicity and Compactness.

Deaco Regulator.

A feature of the Deaco system is the patented device which maintains the amperage of the current developed by the dynamo. It is entirely automatic in its operation and strictly electrical, and by it the stor-

Digitized by Google

age battery is charged at the proper rate regardless of the speed of the motor. All variations of car speed from six miles an hour to the maximum, do not

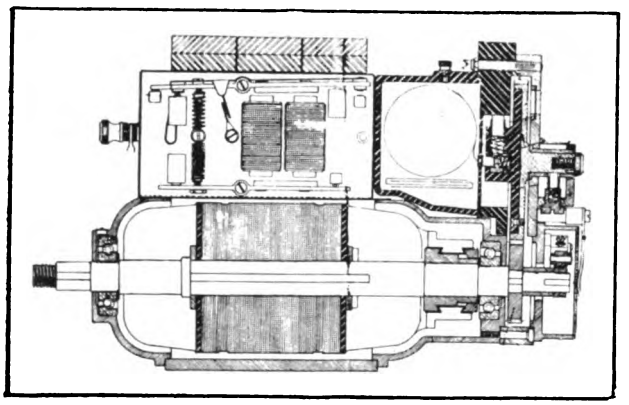

Fig. 59—Sectional View of Deaco Dynamo-Magneto Showing Location of Components.

change the amperage of the current flowing to the battery which is floated on the line.

With all mechanical generators it is important that some method of regulating the electricity be employed, when the device is utilized to charge a storage battery. Too high a rate is injurious to the current container while too low does not charge the cells properly. If the generator be designed to supply the proper charging current at low speeds it is obvious that with the automobile operating at from 30 to 50 miles an hour, for instance, the amount of electricity will be abnormal and both the battery and generator will become affected. This may be said to be due to the fact that the amperage delivered under constant voltage varies almost directly with the speed of the car.

Voltage Constant.

The Deaco dynamo operating without the regulator develops six volts at from 250 to 1500 revolutions, but the amperage varies from one to 18. At 500 revolutions a minute it develops seven amperes, and when the regulator, which is adjustable, is set for this amperage, no more current is produced by the dynamo even when the latter operates at higher ratios.

Components of Regulator.

The device controlling the current is depicted at Fig. 59, which presents a sectional view of the dynamo-magneto. It will be noted that the regulator comprises two electro-magnets which operate two armatures. The latter are pivotally mounted and between the ends are two springs the tension of which returns the armatures to normal position after their movements. Mounted on the ends of the armature members are contact points which make certain connections when regulating the current, this control being entirely automatic.

The two electro-magnets are in series with the line, so that their pull varies according to the flow of the current. The value of this current is regulated by the spring tension which is adjustable. The action of the regulator is illustrated by the series of four diagrams depicted at Fig. 61, these showing the connections in each of the respective positions of the regulator.

The first position shown at A is that in which the magnetic and electric fields are combined, the fields F F being of such polarity that they strengthen the magnetic members. This is the position of the regulator connections corresponding to low speed.

Control of Current.

As the speed of the automobile increases, and that of armature of dynamo as well, the combination of the two fields would be productive of too much current, and in order to keep the amperage at the required point the electro-magnetic field is cut out entirely, the current being supplied by the permanent magnets. A further increase of speed results in a corresponding increase of current and at a certain number of revolutions of the armature the electricity developed by the permanent magnets is too strong.

When a predetermined speed is reached the electric field is reversed and a small amount of current allowed to flow through it. This tends to weaken the permanent magnetic fields, reducing the output of current. Only a small amount of current is passed because resistance R has been introduced in the field circuit at this juncture. A still further increase in speed results in the automatic introduction of resistance. This is accomplished by allowing the full amperage to flow through the field coils, but in a direction which will further weaken the permanent magnetic fields.

It is pointed out that it is impossible to demagnetize the permanent magnets, for the reason that when the speed of the armature decreases the regulator device will become operative, resuming its normal position where it gives a strong field in the correct direction and tends to remagnetize the permanent magnets.

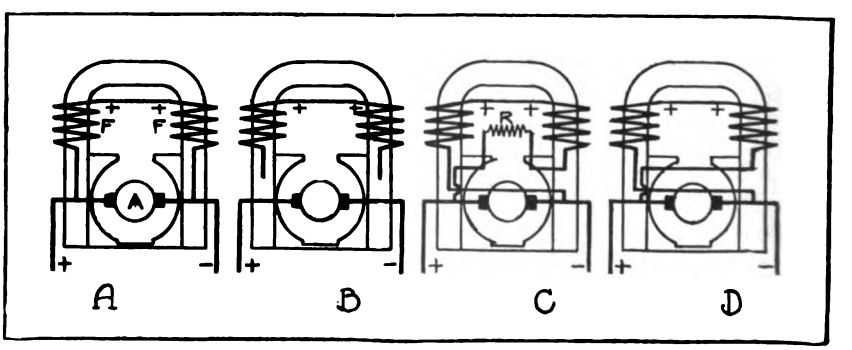

Fig. 60—Diagram Showing the Four Progressive Changes in Generator Connections.

As previously explained, the regulator is necessary

Digitized by Google

to maintain the amperage at a stated quantity, and although the maximum output is considerably greater, the device can be set so that eight amperes are gen-

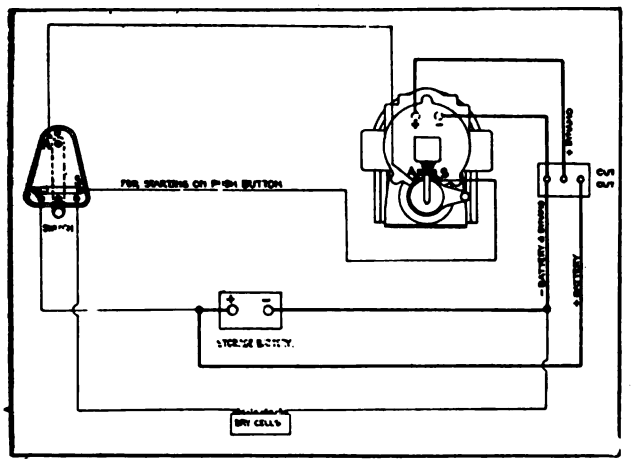

Fig. 61—Wiring Diagram of Dynamo Operating in Right Hand Direction.

erated at the slow speed of 750 revolutions a minute and no more current will be produced with a subsequent increase of the speed of the motor car. The regulator can be adjusted to deliver any predetermined amount of current.

When set to develop eight amperes at 750 revolutions a minute with the voltage remaining constant at six volts, the following results are obtained: Two hundred and fifty revolutions, .25 ampere; 350, two amperes; 450, 3.8 amperes; 550, 5.2 amperes; 650, 6.6 amperes; 750, eight amperes; 1000, eight amperes; all over 1000, eight amperes.

This curve gives current in amperes delivered to the storage battery, but does not show the actual current generated by the dynamo. The regulator in action at certain stages consumes an additional 1.5 amperes through the field winding in strengthening the field magnets. For special conditions where a lesser or greater amperage is desired the exact amperage can be obtained by a simple adjustment in the regulator.

The Regulating Device.

The regulating device is very compact being enclosed in a dust and oil proof housing which is located above the armature casing and between the permanent magnets. Two substantial terminals, plainly marked so that the positive and negative poles may be noted easily, are attached to the housing. Current is collected from the armature by two substantial brushes which are accessible and being constructed of a high grade material make for durability.

To prevent the battery discharging through the dynamo a special switch is furnished by the maker and it is installed to disconnect the dynamo from the battery when the motor car engine is inoperative. The switch is designed to operate in conjunction with the ignition switch and the Detroit Electric Appliance Company supplies one suitable for the member on the machine, and which controls both the ignition and dynamo.

When the dynamo is in service the battery is floated on the line and furnishes all the current that is utilized up to a predetermined number of amperes. If more than this amount is required it is supplied by the battery. If less is used the surplus is stored in the battery. All current generated during the day time, when the lamps are not lighted, is absorbed by the battery which is always charged at a safe rate and in condition to supply current for many hours when the dynamo is inoperative.

The wiring of the Deaco system is very simple as will be noted by the diagram depicted at Fig. 63. The heavy lines denote No. 12 stranded hard braid wire and the fine lines indicate No. 16. The use of double or twin wire is recommended wherever possible and all connections should be well soldered and taped. It is essential that in making connections from the dynamo to the cut-out and thence to the battery, that the diagram be followed in the matter of polarity.

Ignition System.

Reference has been made to the ignition system utilized in connection with the dynamo and this device is illustrated at Fig. 58. When it is considered that the device supplies current for ignition as well as lighting, its compactness will be appreciated. When the ignition feature is incorporated it is essential that the dynamo-magneto be driven at crankshaft speed and

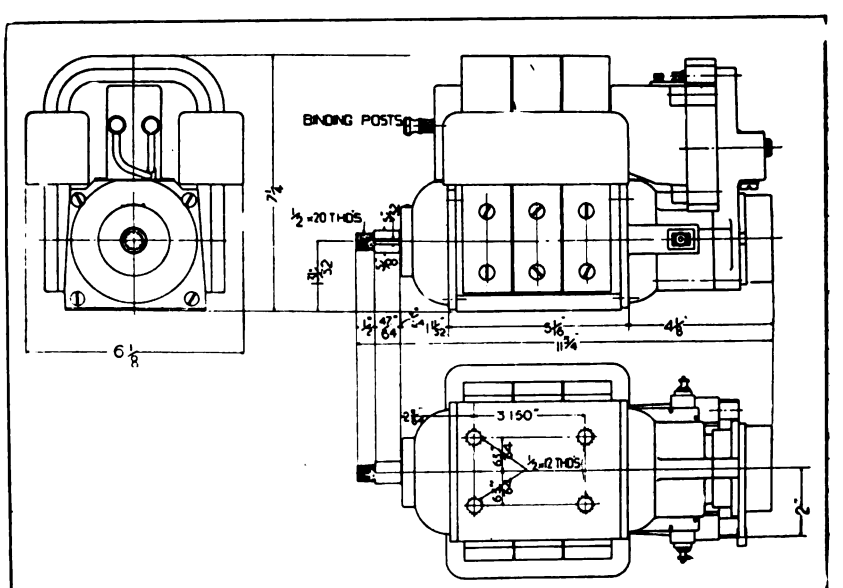

Fig. 62—Dimensions of Dynamo Which Is Slightly Larger Than the Usual Ignition Magneto.

Digitized by Google

by gears or silent chain to insure accurate timing.

The ignition mechanism is attached opposite to the driving end of the shaft and includes a high-tension distributor and breaker box, the latter being movably mounted and allowing for variable ignition. Current is collected from the armature of the dynamo and built up or strengthened, then led to the distributor, thence to the respective plugs of the motor.

The magneto supplies a hot spark at all speeds and the motor may be started from the switch by pressing a push button. Dry cells may also be utilized as will be noted by the wiring diagram presented at Fig. 61, which outlines the method of incorporating the batteries when the dynamo is operated to the right.

Construction and Material.

In the construction of the lighting dynamo and dynamo-magneto, the company utilizes the best material obtainable and each part is fitted carefully by the most experienced workmen. All working parts are enclosed and protected from dust, oil and foreign elements. Each assembly is inspected and the completed dynamos tested carefully. On the test stand the device developed the fact that when operating at 500 revolutions a minute it lighted a group of lamps aggregating 38 candlepower, and that even at 325 revolutions a good light was given.

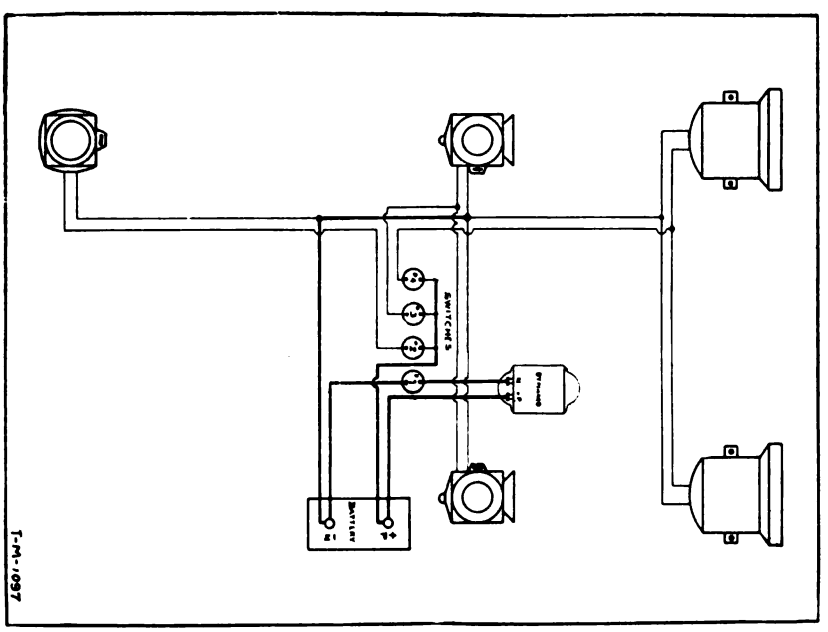

Fig. 63—Wiring Diagram of Lighting Dynamo, Outlining the Connections of Generator, Storage Battery and Switches.

Provision is made for a group of lights consisting of two head, two side and tail, although circuits for a trouble, speedometer or other lamps may be incorporated. A feature of the Deaco system is that through the adjustment of the regulating device to obtain a predetermined amperage, the number of electric lights and their lighting capacity may be increased over that of ordinary systems.

(To Be Continued.)

TAMPA CLUB HAS NEW HOME.

The Tampa Automobile and Golf Club, Tampa, Fla., is now occupying a new home some seven miles from the city on the Rocky Point Road. It is built of reinforced concrete in the mission style, and is valued at $30,000. Golf links which cost $20,000 surround the house.

INVENTOR OF EXPLOSIVE MOTOR.

Word comes from Paris that Fernand Forest, the inventor of the explosive or internal combustion motor is living in poverty, and that an appeal has been made in his behalf to the French government for aid. He was decorated in 1910 with the cross of Legion of Honor, so that some recognition has been taken of his contribution to the world, but like many inventors, lack of business instinct prevented him from realizing on his invention, so that today, with his large family he is living in much poorer circumstances than some of the mechanics employed in the factories which his motor has made possible.

In 1881, one of Mr. Forest's first explosion motor was given a place in the Museums of Arts-et-Metiers in Paris, and since then the engine has changed somewhat in form, but not in principle. It was not, however, until 30 years later that any official recognition was given, when the Knighthood of the Legion of Honor was bestowed upon him. Calling attention to these facts, G. Du Mourier, president of the Association of Small Fabricants and Inventors, has appealed to the government for financial recognition of the services of Mr. Forest, and it is expected that definite action will be taken immediately.

NEW MINNESOTA ASSOCIATION.

The Minnesota Valley Scenic Highway Association has been formed at Belle Plaine, Minn., and is to work for the proposed 100-mile road from Mankato to Minneapolis. Part of this road has been constructed and is of the clay type. The 12 miles from Mankato to Madison Lake is in use.

The Remy Electric Company, Anderson, Ind., is enlarging the chain of service stations which it is conducting. The Frey Auto Company, Buffalo, N. Y., has been appointed the service station for Buffalo and vicinity, while the Rogers Auto & Supply Company, Columbus, O., also has been added to the list.

SCIENCE AND THE AUTOMOBILE.

So much has been heard about the scientific methods of the German manufacturers and so little, comparatively, about the factory science of the American firms that many people will be surprised to learn of the great part that it plays in the manufacture of the American automobile, as told by J. H. Newmark of the General Motors Company, Detroit. He recently described the scientific department of his company and emphasized the skill and care that goes into the product of the constituent concerns.

The company maintains a research department which is claimed to be the most exhaustive institution of its kind in any automobile factory. In this everything that goes into the cars is carefully tested, no matter how small or trivial, from cotter pins and nuts to frame members. So thorough is the work of the department and so detailed the results which are kept, that the director, Claude E. Cox, is able to give the full pedigree of every article, from grease to rear axles, used in the plant.

The department keeps in touch with modern engineering methods and with current practise in motor car construction in this country and abroad. A testing laboratory is maintained, with machines for testing all materials. Some, for testing the tensile strength of steel, are powerful enough to exert a pull of over 100 tons, and are used in testing axle material.

At present, this department, with the chemical laboratory, is developing a new steel which is expected to establish a new standard of strength and at the same time lessen the cost of production. Severe tests are being given it, chemical as well as physical, all the work being kept carefully secret until such time as the steel is ready for use.

One of the most interesting features of the department is the museum. Here is carefully kept a sample of everything tested, with the results. There are carburetors, rods of steel, nuts, bolts, cable, magnetos, oils, greases, and all the many parts of the automobile. The oil department is especially valuable, for by examining the samples of lubricants after they have stood for a time the qualities are revealed, enabling the claims of manufacturers and salesmen to be substantiated.

The records of the General Motors Company are carefully kept, consisting of blue prints of every car made, with catalogues and specifications for the different years, which, with the samples, places full information of any car conveniently at hand, for the use of the company and its subsidiaries.

AUTOMOBILE ENGINEERS.

Joseph Tracy, the well known automobile engineer, and Henry F. Donaldson, have associated themselves as automobile engineers, and have taken new offices in New York City at 1786 Broadway, corner 58th street. The two men will undertake consultation, research and development work, and conduct design and construction tests in the laboratory and on the road.

WOMEN ENJOY THE REO.

The successful automobile of today is that which makes its appeal to the women of the family. This by no means applies exclusively to the matter of appearance, because the modern woman is quite as capable of understanding the mechanical features of the car as her husband. Practically all manufacturers recognize the truth of this statement, and it has left its impression upon the work of the designing and construction departments of most concerns.

Party of New York Women and Children Enjoying a Spring Ride in Reo.

One of the concerns which has paid particular attention to the desires of women in this regard is the Reo Motor Car Company, Lansing, Mich., maker of Reo cars, for which R. M. Owen & Co., New York City, is general distributor. An accompanying illustration shows one of these machines in the hands of a party of women and children enjoying one of the few really spring-like days of the present season along Long Island sound in Westchester county, New York.

The Mais Motor Truck Company, Indianapolis, Ind., is to build an addition to its factory which will increase the floor space by 20,000 square feet. It is expected to be completed in about a month, and that several new models will be announced when it is placed in full operation. The present factory has been working night and day to keep up with orders, and the addition was needed to relieve the congestion.

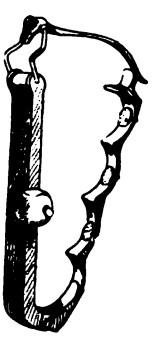
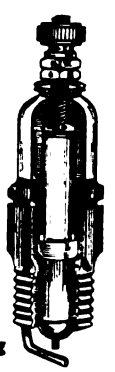
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

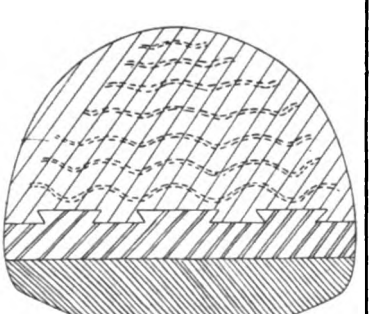


The Blackburn Lock Switch has been brought out by the Blackburn Specialty Company, 1132 Prospect avenue, Cleveland, O., and offers a means of locking the ignition circuit so as to prevent the operation of the car. The device is very simple, the idea being that of substituting for the usual ignition key and socket which is so easily manipulated, a Yale lock of the pin and tumbler type. The key of this lock acts as the ignition plug for turning the switch from "off" to "battery" or "magneto" or vice versa, and when it is removed the switch cannot be turned with any but the proper key. This gives as much security in locking the automobile as in locking the front door of the house. The switch cover cannot be removed even if unscrewed, until after the key has been inserted and turned to the releasing point. When the switch is mounted on a coil, it is impossible to short circuit the wiring.

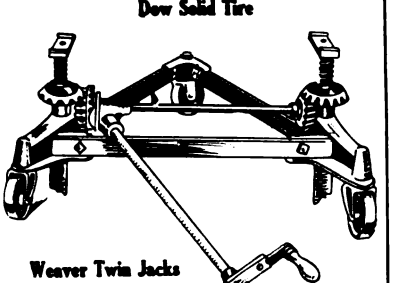
★



The Bair Top Holder is being placed on the market by the Auto Specialties Manufacturing Company of Chicago and is a device for holding the top bows rigidly together when the top is down. This prevents rattling and undue distortion of the bows, and is such an advantage that it is already standard equipment on a number of cars. It is made in two sections, hinged together at the bottom so that when the clamp at the upper end is loosened the holder opens, and allows the bows to be raised. The small hand lever attached to the clamp enables it to be manipulated easily and without delay. One side of the device is provided with a clamp and set screw for attaching to the side of the car. The hinged section which is provided with sockets to hold the bows is so made of steel covered with leather that the bow is not scratched or marred, and the leather seam in the covered bows is not injured.



Blackburn Lock Switch



Bair Top Holder

Sturdy Spark Plug

Dow Solid Tire

Weaver Twin Jacks

The Sturdy Spark Plug is made by the Sturdy Manufacturing Company, 2637 Michigan avenue, Chicago, and is marketed in sets for four and six-cylinder cars, the set consisting of the requisite number of plugs with an extra one in a leather case for tool box. A feature of the construction is that the main porcelain is suspended against the bushing in such manner as to permit the upper spring washers to take up the contraction and expansion caused by the cooling and heating of the engine. In cleaning there are practically only two units, as the bushing unscrews from the shell, and in replacing it is drawn down to the shoulder with no possibility of cracking the porcelain. The plug is guaranteed against everything but abuse.

★

The Dow Tire is a new type of solid tire which has been invented by Alexander Dow, 104 West 42nd street, New York City, and has as its distinctive feature a number of layers of fabric embedded in the rubber. The idea of this construction is to prevent the tearing of the tire, and confine the loss of rubber strictly to what might be called legitimate wear. Rubber when enclosed offers great resistance to compression, and therefore the alteration of a tire under load is distortion. This free distorsion is permitted in the Dow tire by the fabric being corrugated, and as these corrugations run diagonally with the circumference of the tire, provision is made for both lateral and circumferential distorsion. Elasticity of the fabric along the crests of the corrugations is taken care of by laying the fabric with the diagonal of the weave in line with the crests.

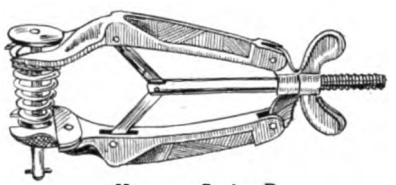
★

Weaver Twin Jacks are made by the Weaver Manufacturing Company, Springfield, Ill., and are a combination of lifting jack, turntable, truck and tire rest. As may

Digitized by Google

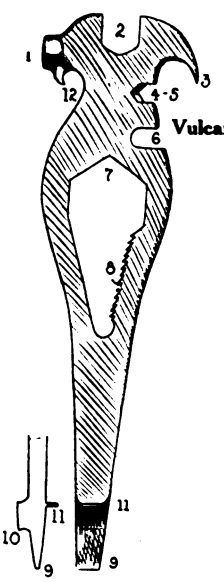
be seen, the device consists of a triangular wheeled frame supporting two jack members, both operated by a crank through bevel gears. By it the front or rear axle of a car may be raised clear at one operation, and the car pushed where desired on the jack wheels.

★



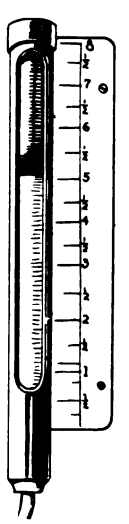
The Kraemer Spring Remover is made by the United States Compass Company, Cedarburg, Wis., and is a simple tool for releasing valve springs. The construction and method of operation is easily understood from examination of the illustration. The jaw is adjustable and may be set in a few seconds to fit any size motor, large or small. When the tool is in place with the two jaws at opposite ends of the spring, turning the thumb screw on its threaded rod draws the jaws together and thus compresses the spring, enabling the valve and then the spring to be removed. The spring is held compressed by the device, enabling both hands to be used in removing the valve.

★

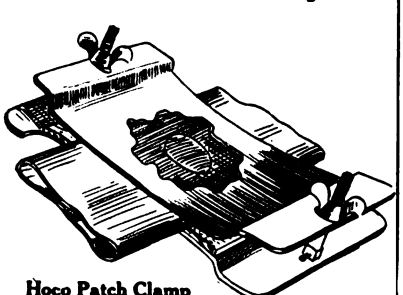


The Vulcan Auto Tool is being placed on the market by J. H. Williams & Co., Brooklyn, N. Y., and is a combination tool which should be of especial value to automobilists. It is drop forged and tempered, and in its canvas cover forms a handy hip pocket companion, as it is not bulky or unduly heavy. The various parts are used as follows: 1, hammer; 2, tire lug wrench; 3, cotter pin puller; 4, gas tank wrench; 5, insulation scraper; 6, air tank wrench; 7, spark plug wrench; 8, alligator wrench; 9, 10, 11, cotter pin spreader and three screw drivers; 12, bottle opener.

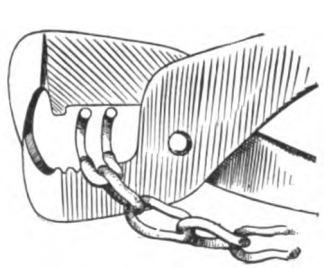
★



Rudell's Gasoline Register is made by the California Novelty Art Company, 618 South Olive street, Los Angeles, Cal., and, as its name indicates, registers the amount of gasoline in the tank. It is not dependent for its operation upon floats, springs or compression parts which may wear and get out of order. It is simple in construction and may be attached in less than 20 minutes. Its advantages are obvious. It enables the driver to see at all times the amount of gasoline unconsumed, and in buying affords a check on the accuracy of the garage measures. It makes it unnecessary to take up the seat and put a dirty stick in the tank to see how much gas remains. The device is nickel plated, and may be attached where desired on the dash or elsewhere. It may be attached by screwing to the tank outlet, or by putting a T in the gasoline line.



Kraemer Spring Remover



Vulcan Auto Tool

Rudell Gasoline Register

Hoco Patch Clamp

Necessity Tire Chain Tool

★

The Hoco Inner Tube Patch Clamp will be appreciated by motorists who have made repairs on inner tubes. It is made by Hoeft & Co., Chicago, and will fit any tube. In repairing a tube with a patch, pressure on both is desirable, as it spreads the cement and aids the vulcanizing agent thoroughly to bind and incorporate the two surfaces, making them homogeneous. Motorists on the road, realizing this sometimes adopt ingenious expedients to secure this pressure, as for instance, sitting on the patch, placing a board and a miscellaneous collection of tools on top, etc. With the Hoco patch clamp this is unnecessary. Thumb screws draw together the two plates between which the tube is held, applying a firm pressure through the spring metal of which the back is constructed. The device will take any tube, and is made of steel, nickel plated. The weight is 24 ounces.

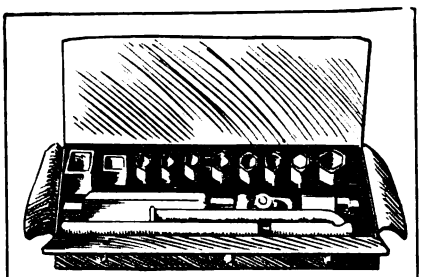
★

The Necessity Tire Chain Tool is manufactured by J. N. Macdonald & Co., Wethersfield, Conn., and is being distributed by T. F. Russell & Co., of Boston. As its name implies, this is a device for repairing tire chains. The jaws are of a special construction, and by means of the instrument the hooked ends of the chain links may be forced apart easily, or compressed just as readily. Those who have tried to repair tire chains with pliers, chisels, screw drivers, and other tools not at all adapted to manipulate the heavy

Digitized by Google

wire links of which the chain is made, will thoroughly appreciate this tool, which renders repairs easy and enables them to be effected in a short time.

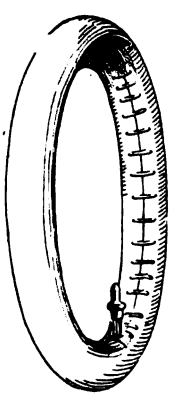
★



The Ray Socket Wrench is being manufactured by the Packer Auto Specialty Company, Chicago, and distributed by the Fulton-Grubb Company, 1146 South Michigan avenue. It is made in two sets, the smaller being illustrated. With the wrench comes a complete line of sockets made of pressed steel, cold drawn and case hardened, an assortment of screw drivers, a universal joint, permitting the use of the wrench at any angle up to 90 degrees, one long and two short extension bars, and a long socket for use on spark plugs, enabling their removal without cracking the porcelain. The wrench itself is of the ratchet type practically noiseless in operation, nickel plated and polished, and with the use of the various sockets and attachments it is possible to get into almost any place, no matter how difficult of access.

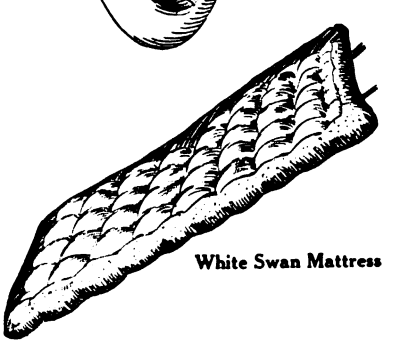
★

The Rekar Automatic Starter is made by the Rekar Automatic Starter Company, Sixth and Market streets, San Francisco, and provides means whereby a charge of acetylene gas is introduced into the motor cylinders and then fired, to start the motor. The starter consists of a controller which is attached to the dash, from which piping leads the gas to the cylinders. Pushing the rod on the controller admits the gas to the cylinders and affords a mixture to be exploded by the usual spark.

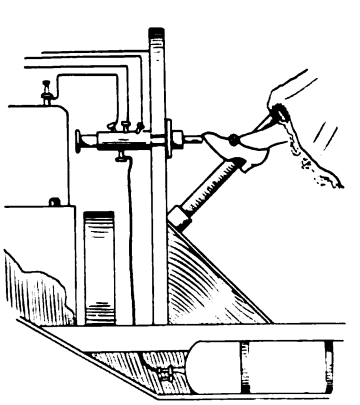


★

The Brownie Liner, made by the States Manufacturing Company, 1029-35 West Adams street, Chicago, will be appreciated by motorists who have had experience with punctures and blow-outs. As its name indicates, it is a liner to go between the tire casing and the inner tube. It is claimed that it will prevent 90 per cent. of the punctures and all of the blowouts,



Ray Socket Wrench



Brownie Inner Liner

White Swan Mattress

Rekar Starter

thus enabling new tires to make 10,000 miles. It consists of what is virtually an extra casing of very tough fabric which is neatly laced around the inner tube. The fabric is almost impenetrable, it being practically impossible to drive a nail through it when attached to an inner tube. The casing is guaranteed, and comes in all sizes.

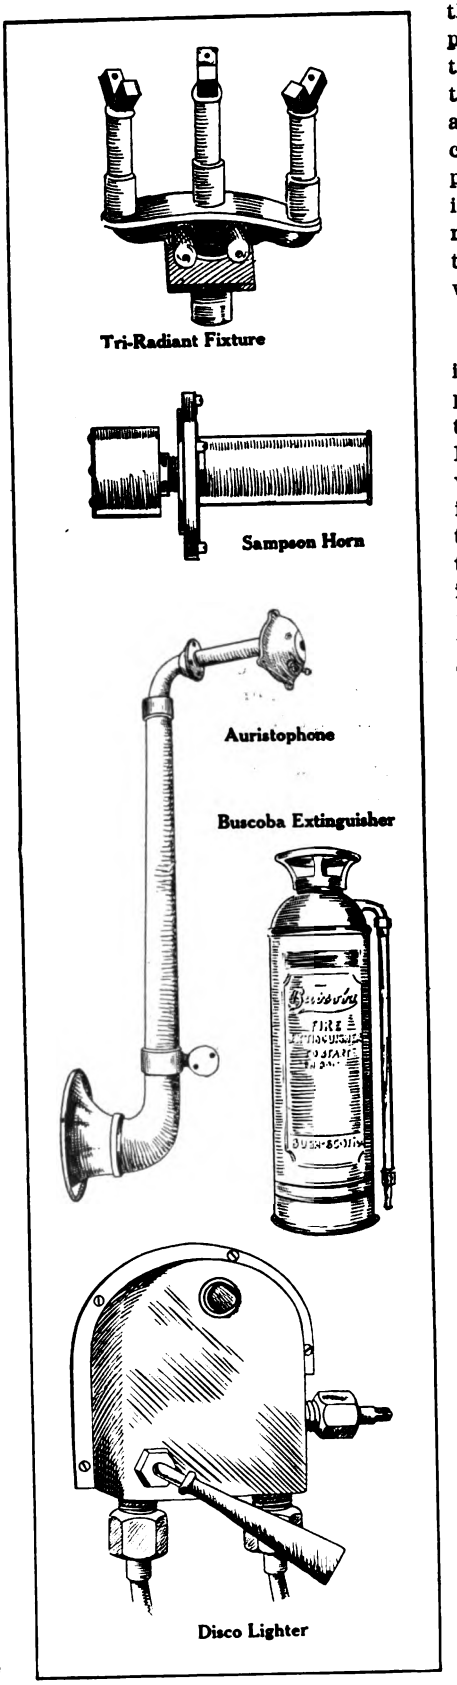
★

The White Swan Camp Mattress is made by the T. B. Burnett Company, Dallas, Tex., and should be of much service to motorists during the coming touring season, as it affords the comfort of a bed combined with portableness. It is made with heavy waterproof duck sides and bottom, so that it does not absorb moisture, or become cold and uncomfortable. It may be rolled up into a neat compact water tight bundle that can be carried conveniently in the automobile, a canvas bag being provided for this purpose. It is built up of 1400 layers of cotton felt, made from long staple Texas cotton, and is sterilized so as to be free from danger of disease. It comes in standard length of 6.5 feet and varying widths, weighing up to 25 pounds.

★

The Tri-Radiant Fixture is made by the Lenhart Manufacturing Company, 246 North Delaware avenue, Philadelphia, and is an attachment for acetylene lamps which enables three burners to be used. The fixture, as illustrated, bears the three burners on an arm, the two outside ones turned so as to present the broad surface of the flame to the surface of the mirror or reflector opposite it. The result of this construction is that a broad beam of light is projected from each side of the lamp, the illumination spreading wider than when only one central burner is employed. The light to the extreme right and left is as strong as at the centre, with no intermediate lines of darkness, and the illumination is held to be highly satisfactory. The broadness of the burner insures that all parts of

Digitized by Google



the road are covered, preventing accidents in passing cars or in running into them at curves. The light covers a greater angle than one in which a car can be turned. The fixture is substantially made of brass, nicely finished and nickel plated throughout, and furnished with the best hexagon burners. These burners have a much smaller capacity than those ordinarily used, thereby cutting down the gas consumption. In fact the effect of the fixture is virtually to divert the gas which is usually sent to the central burner to the three burners and thus spread its illumination wider. Either one or both of the side burners may be turned off at will.

★

The Sampson Horn is a new style of this well known product of the American Electric Company, State and 64th streets, Chicago. It is of the torpedo type, and is designated No. 4, with a straight cylindrical projector of spun brass. It is an electrical horn, and requires little current, bein operated on four dry cells or a six-volt storage battery. The magnets are large and powerful, wound to a high resistance with enameled wire and therefore require a minimum of current. Sparking is reduced as low as possible and the mechanism is enclosed in a neat enameled iron case. This case is the same in all the horns, the projectors being interchangeable on it. Six types of projector or horn may be had.

★

The Auristophone is an electric speaking annunciator, made specially for automobiles by the H. G. Pape Electric & Manufacturing Company, Buffalo. It is similar in construction to the electric announcer in use in the large railway terminals, but is smaller and not so loud. It is adapted to be placed beside the chauffeur of a limousine car, with the transmitter attached to a cable in the inside of the machine. The convenience of this will be appreciated by those who have tried to make a chauffer understand sign language through the glass of the limousine partition or words shouted through an ordinary speaking tube. The apparatus is in effect a powerful telephone, and the receiver at the chauffeur's side repeats distinctly the words spoken into the small watch case transmitter. The wiring is simple, and the system requires only a six-volt storage battery or dry cells.

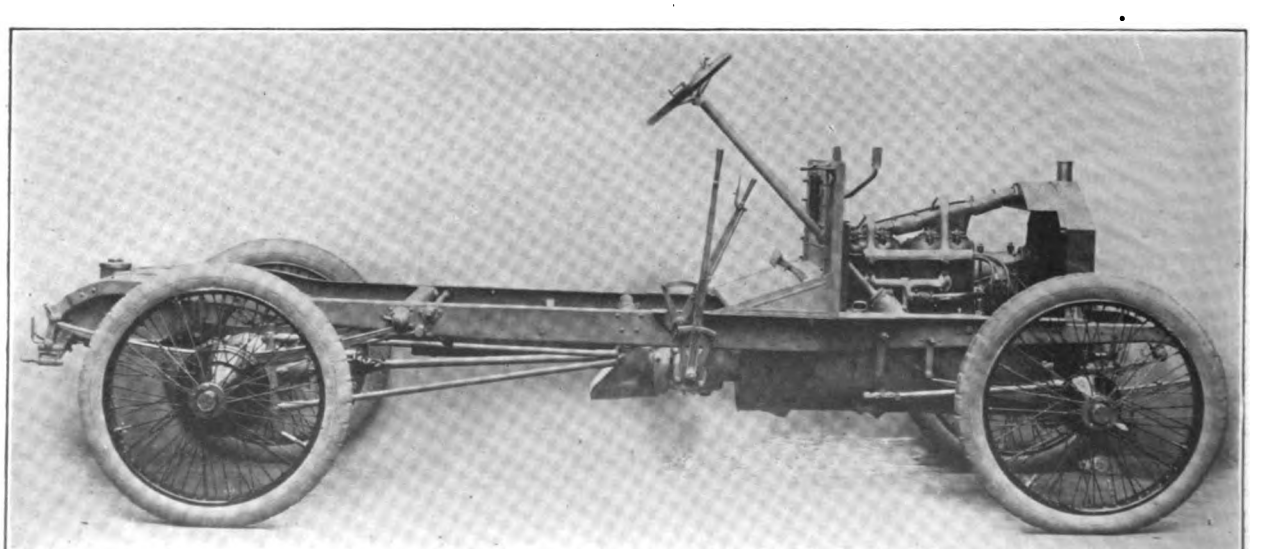
★

The Buscoba Fire Extinguisher is made by the Bush-Scott Company, 31 Woodward avenue, Detroit, and is of the liquid variety. It is of the conventional type, in which it is only necessary to turn it bottom up with a jerk to start the extinguishing fluid. It is tested to 350 pounds pressure, and is strongly constructed so that neither bottom nor top can be blown off, or the hose torn off. The metal is heavy Lake Superior cold rolled copper. The capacity of the extinguisher is three gallons, which is ample to take care of a good sized blaze. The liquid liberates carbon dioxide gas, which smothers the fire effectually.

★

The Disco Lighter is made by the manufacturer of the well known Disco self-starter, the Ignition Starter Company, Detroit. This ensures that it possesses the merits of the starter, and will be reliable in action. It is a system for igniting the gas headlights of a car from the seat, and consists of a dash controller, piping, single unit vibrating coil, wire, burners with spark gaps and all fittings. The controller is illustrated, and consists of a neat and highly polished bronze member which is screwed to the dash. Turning the handle of the controller to the left opens the valve and sends the gas to the lamps, while a pressure on the button at the top of the controller sends the current to the coil and produces sparks at the points of the burners, igniting the gas. The maximum flow of gas through the controller is regulated by a needle valve, preventing undue consumption of acetylene, and if desired the handle may be partly closed in cities to dim the lights.

Digitized by Google



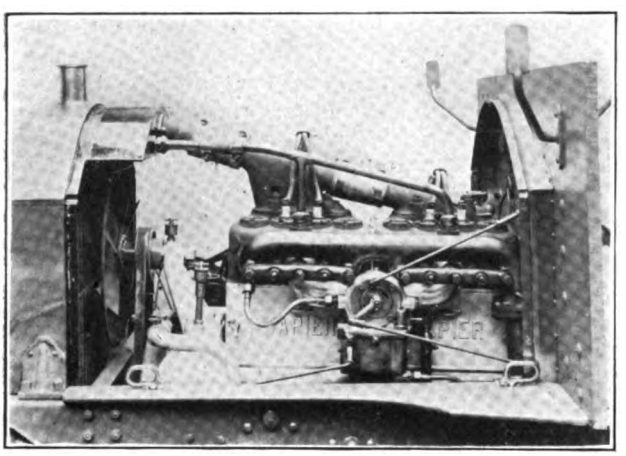
The 15 horsepower Napier Colonial model, made by S. F. Edge, Ltd., London, England, and shown herewith, is designed especially for use in countries where the road conditions are not regarded as of the best. This applies more particularly to the chassis, to which a number of body designs is fitted. That illustrated on another page is suggested for more general service, being a combination body, which may be utilized as an enclosed car for town use and as an open vehicle for long distance touring. The chassis construction in this and the other Colonial designs is especially strong and enduring.

Mr. Edge, who is more or less well known in America because of his prominence in driving Napier cars in contest work, has only recently returned from South Africa, a trip which he undertook for the purpose of testing out the new Colonial chassis under what may be termed the worst Colonial conditions. He reports that the result was quite as favorable as he expected, and he now offers this chassis as an ideal product for use in such parts of the world as Australia, New Zealand, Canada, Argentine, Brazil, Siam, India, China, etc. No doubt a brief description of its components will be received with interest in America.

The motor is a four-cylinder, water-cooled unit, with bore of 3.25 inches and stroke of five. The cylinders are arranged in pairs, with camshaft and all gearing entirely enclosed in a dust proof, oil tight case. The inlet and exhaust valves are all operated by one camshaft, and are interchangeable.

Particular attention is called to the fact that the flywheel is fitted to the front of the engine, as this is considered a matter of unusual importance. It will be understood that British motorists pay rather more attention to the matter of road clearance than is true on this side. Mr. Edge maintains that inasmuch as the flywheel is the lowest point of the motor, it should be so located that it will not catch on any projection in the road surface. Placing it at the front between the two forward wheels, it is claimed that it is lifted over obstructions at the same time the road members ride over them.

Lubrication is by gear driven pump, and the system is so arranged that equal distribution of the oil is



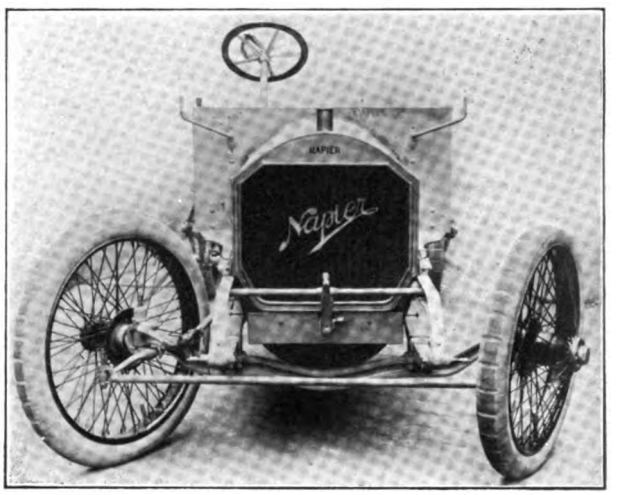
Chassis of the 15 Horsepower Napier Colonial Model, Recently Tried Out by S. F. Edge of England on a Tour Throughout South Africa.

Digitized by Google

provided to all parts of the motor, regardless of whether the car is climbing steep grades or running on level ways. The system also includes a wire gauze strainer for filtration purposes. Grease cups are fitted to the spring shackles and other parts where necessary, it being maintained that oilers practically are useless in extremely warm countries.

Ignition is by high-tension magneto, gear driven and arranged so that the instrument may be detached readily. The carburetor is a special Napier design, fitted with a large wire gauze cover over the air inlet, so as to prevent the introduction of dust and other foreign matter. The temperature of the vaporizer can be regulated at will by means of a small tap, conveniently located, which controls the amount of exhaust gases passing through the pipe which enters the carburetor jacket at the left, as seen in an accompanying illustration.

Cooling is by the thermo-syphon system, employing a large and efficient tubular radiator. In addition to the pump shown in the front of the engine,

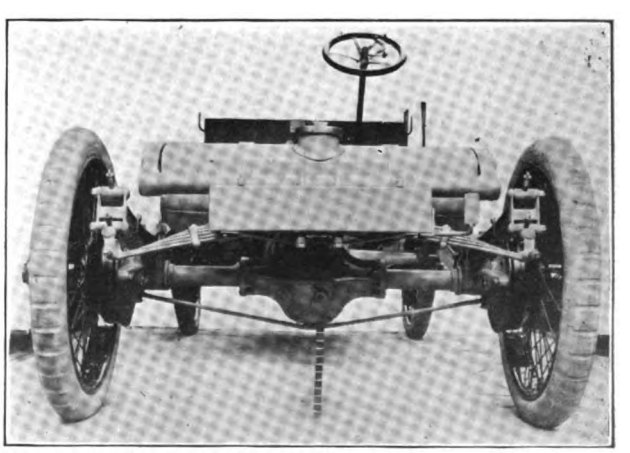


Carburetor Side of Napier Motor, Showing Neatness and Accessibility of the Design.

there is a very large water pipe leading into the extra water tank at the top of the radiator, and another from the side of the cylinders, insuring that the cooling fluid shall circulate freely around the valves. A light metal fan, made entirely in one piece, aids in the work of the radiator, while an extra air valve is fitted to the carburetor, this being controlled by a lever on the dash.

The clutch is of the metal-to-metal type, running in oil. The transmission affords three speeds forward and reverse with direct on the high. Two sets of brakes are fitted, one on the main shaft and the other on the rear wheel hubs. Springs are semi-elliptic, front and rear, extra long and flexible to give easy riding qualities.

As shown the chassis is fitted with detachable wire wheels, although wood members are supplied as standard. The rear view shows the 11-inch clearance, and this may be increased to 13 inches, by the use of larger sized wheels. It also will be noted that a trans-



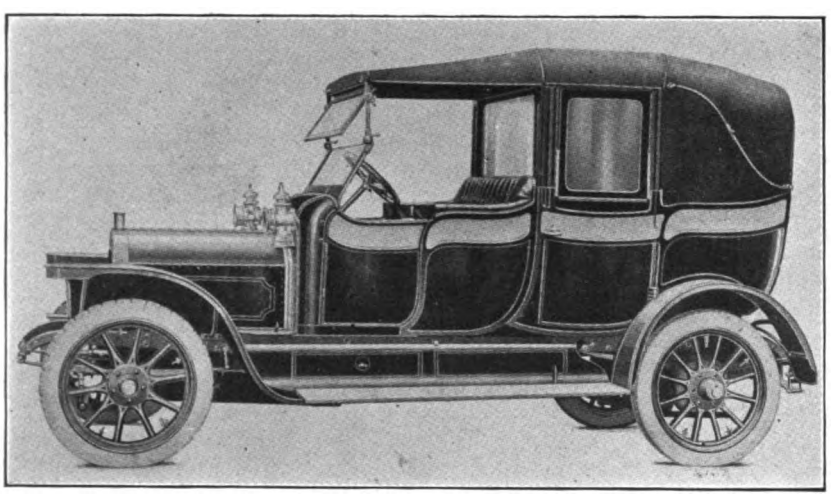
Front View of Napier Chassis, with Special Locking Gear for Making Quick Turns.

verse spring at the rear is designed to prevent the frame from becoming contorted as well as to provide greater comfort to the occupants of the car.

Mention also should be made of the gasoline tank, neatly applied at the rear of the frame. The fuel is forced to the engine under pressure by means of a direct driven air pump. The very strong rear axle is fitted with stay rods, a feature which has been incorporated for use over very rough roads. A specially low gear ratio enables the machine to travel over soft and sandy places, to ascend very steep hills and climb out of river beds.

The front view brings to notice the special steering lock, designed to enable the car to be turned in a very short radius, a condition which is highly important in some districts, where hairpin curves have to be negotiated in climbing mountain passes, etc. A specially strong front axle is employed, another point that is regarded as extremely important by the designer, inasmuch as it is anticipated that the car will be called upon to travel over roads on which the cen-

Back View of Napier Chassis, Presenting Road Clearance and Features of Construction.



Digitized by Google

tre is considerably higher than the wheel tracks and additional protection to the engine will thus become necessary.

Several body designs are available. For Colonial use the torpedo type is suggested. A doctor's two-seated coupe, capable of being used open or closed; a landaulet, cabriolet and touring phaeton, also are offered. That shown herewith is the cabriolet, and has been evolved to meet the requirements of those who want a perfect town carriage completely enclosed and free from draughts of any sort, yet possible of being utilized as an open car for cross country touring. The design is thoroughly in keeping with the British demand for something graceful and distinctive.

★

German motorists have decided to boycott the Duchy of Gotha and are advising tourists of their decision. This is one of the most picturesque portions of the Fatherland, but it is claimed that the authorities have imposed a new and wholly unwarranted road toll on motor cars. As a result of this action, the main route leading from Erfurt to Eisenach, one of the show places of Germany and where Luther translated the Bible, has been almost entirely deserted. Under ordinary circumstances there were from 60 to 70 automobiles to be counted over this course in a single morning.

Cabriolet Body Fitted to 15 Horsepower Napier Chassis, Affording Enclosed Car for Town Use and Open for Long Distance Touring.

★

In the recent gasoline consumption trials of the Herts County Automobile Club in England, the first and second prizes went to De Dion-Bouton cars, both privately owned and driven by their owners. The winner's consumption figured out at 48.7 miles a gallon, and it should be added that the machine is four years old. The winner of second place was eight years old.

★

Argylls, Ltd., of Alexandria, Scotland, whose product was described in the last issue of The Automobile Journal, is experiencing such extensive demand for its Argyll cars that its very handsome catalogue has been translated into Spanish, Portuguese and French. The company recently received the following from a correspondent in the south of Scotland:

"It may interest you to know that the little Argyll cab took an invalid from here, with the doctor and chauffeur, to Dumfries Infirmary to be operated on (a case of life or death), in 1:30:00. The distance is 52 miles. The trip was made without changing a gear, slowing down for the invalid on the rough parts of the road. I have never done it in the same time, not even with a 40 horsepower, six-cylinder."

★

Consul Church Howe of England reports that the Manchester district is second only to London in the facilities and opportunities for the sale of automobiles, and that London authorities have described Manchester as the world's best centre for the sale of commercial vehicles. American manufacturers are making steady progress in this field and agencies have been established for the Flanders, E-M-F, Mitchell, White and Overland, while the Ford Motor Company has a factory there where the motor parts, shipped from the United States, are assembled and finished cars produced. The plant has a capacity of 3000 to 4000 cars a year. A local paper commenting upon the situation, said recently:

"America is only a few days distance from England, and with the best of American methods of obtaining publicity it does not take long for the merits of a car to be made known to the English public. So far there does not seem to be any settled plan of campaign against them by the English makers. For a long time it was the practise of England to book the order and build the car afterwards. In America the firms build the car and create the demand. The public wants a smart looking, low priced car that will stand rough wear. The American machine is not the thoughtlessly designed, fragile looking article that we have been led to believe. If the British maker does not immediately rise to the occasion, the British agent and the buying public will, and when it is too late the wholesale trade will be the American's."

★

The public officials in Venezuela are constructing a road from near Maracay, a railroad station between Caracas and Valencia, northward to the coast at Ocumare, where some of the coastwise steamers now touch. When this new road is completed much cacao and coffee, which now goes by rail to La Guaira or Puerto Cabello, will be brought to Ocumare and taken by

Digitized by Google

boat to one of the ports mentioned. The use of automobiles to transport these products is contemplated.

★

A noteworthy feature incident to the ceremonies of inaugurating the new sugar central at Bago, Philippine Islands, was the large number of automobiles present. There were no fewer than 30 owned by hacendades, who rode in for the occasion. Nothing could testify better to the prosperity that now exists in Negros.

★

The long anticipated motor mail service between Manchester and Birmingham in England has been inaugurated with three Belsize cars, made by the Belsize Motors, Ltd., Clayton, Manchester. The post-office authorities have entered into a three years' contract with the Auto Van Maintenance Company of Manchester, to run this road service, and figures have been obtained which prove conclusively that it will be far more economical than the older methods employed heretofore.

The type of vehicle utilized is shown herewith, this being the regular 28 horsepower, four-cylinder, three-ton chassis, fitted with a handsome and commodious red mail van body. Entrance to the rear is by means of a flight of steps, which automatically folds up when the doors are closed. These latter are locked and unlocked either from the inside or outside, as occasion demands. Inside the van is a guard's folding seat and hooks for mail bags, racks and all conveniences for handling the mail en route. Twin Pollack solid tires are fitted to the rear wheels and single in front.

Type of Belsize Motor Mail Van Recently Placed in Service Between Manchester and Birmingham, England.

The vehicles will run twice a day between Manchester and Birmingham, by way of Stockport, Macclesfield, Congleton and Stafford, and meet and pass each other between Stone and Stafford. Eight and one-half hours is allowed for the distance on each journey.

★

An indication of the growth of motoring in the Orange Free State, South Africa, is found in the recent organization of the Orange Free State Automobile Club.

★

A new step in the development of the motor omnibus in London is the introduction of the gasoline-electric car. The advantages claimed for this are "smoothness and silence in running, increased power of acceleration, decreased cost of running, maintenance and lubricants, and the durability of its system of transmitting the power from the gasoline engine to the driving wheels." The Great Western Railway Company is now making experiments with a gasoline-electric coach, which is an evidence of the competition that is now in progress between different power producing systems for both rail and road traction.

★

A writer in the Rhodesia Agricultural Journal, published in South Africa, speaks of the scope for steam plowing outfits to do useful and profitable work in Rhodesia and makes enthusiastic reference to the performance of a large eight-furrow American plow drawn by a single-cylinder 25 horsepower traction engine built by a firm in Gainsborough, England.

★

The municipality of Singapore, in the Malay peninsular, has ordered its fifth motor fire vehicle, and is claimed to be the first city in the Far East to have a fire department, completely motor equipped. The new car is fitted with a 55 horsepower engine and steel wheels. This latter innovation is said to have been the result of a distinct problem which has arisen with the use of wood. The humidity of the atmosphere is held to be the cause of the trouble and it is stated that one set of wheels entirely rotted away within four months.

★

After making exhaustive tests of the vehicles available for the purpose the city of Paris has ordered 46 motor sweepers from the makers of Renault and Laffly machines, and nine water wagons from the producers of Laffly and De Dion-Bouton cars. In the combined sweeper and sprinkler class no machine was found entirely satisfactory.

Digitized by Google

USEFUL AUXILIARY SEARCHLIGHT.

One of the most important accessories of the motor car is good headlights and without suitable members night driving is anything but pleasure. With fixed lamps the highway is well lighted, but when curves are being described, the straight beams leave one side of the road in darkness. Then again, when touring over strange roads and the driver is not sure of his direction, the scrutiny of the signboard involves backing and changing the position of the machine unless the operator climbs out of his seat and resorts to the usual match to read the directions.

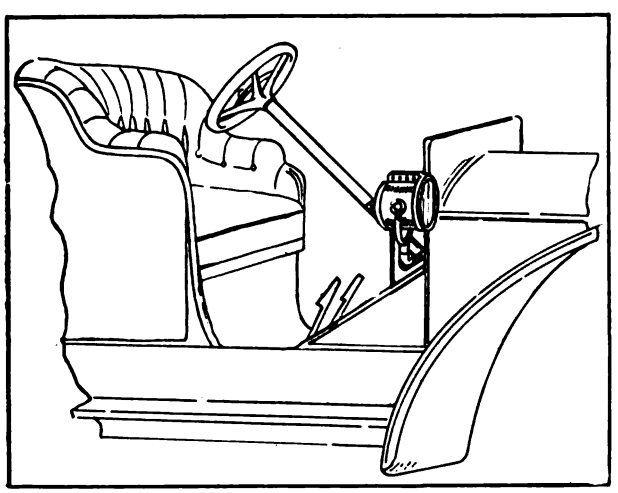


Fig. 1—Novel Method of Mounting Small, Movable Searchlight on Dash as Auxiliary to Lighting System.

Before the windshield became a part of the standard equipment the dash searchlight was very popular, and for an all around light it was far superior to the fixed lamps as rays could be directed in any direction and a first class lamp would light up the road in front as well as cover it completely. Fitting the dash type lamp is a more or less awkward operation when a glass windshield is employed, and for this reason it does not enjoy the popularity it deserves.

A novel method of attaching one of these, inasmuch as the device does not interfere in any way with the other accessories of the car, is depicted at Fig. 1, and was noted by the writer on a car the owner of which does considerable touring and over strange roads. As will be noted, the lamp is a small one but sufficiently large to project a strong beam and it has proved its worth on several occasions when the wrong road was taken and the road signboard was consulted.

The support consists of a piece of cold rolled steel which was bent to the shape illustrated and secured to the floorboard and dash. The extension was made to take the pivotal arm of the lamp which was connected to the main line of the gas tank by rubber tubing. Being equipped with a petcock the acetylene could be shut off or used as desired.

INFLATING TIRES.

It is surprising to note how very few owners of cars know how to inflate a tire properly; that is to pump tube up to the stated pressure. Out of curiosity, the writer has watched motorists pump up tires and kept a careful count of those who accomplished the work without considerable labor. He was surprised to discover that fully 80 per cent. of the pumps held as worthless were not so much to blame as the operator.

Inflating a tire should not require any great strength. The stroke of the pump should open the valve of the tube easily and allow the air to flow therein, and the tire should be pumped hard without undue exertion. Many times the owner will complain that the pump leaks. It may slightly, when the pressure becomes too great, but in most cases this is due to the fact that the tire valve is screwed down too hard, usually to prevent a leak.

To pump a shoe easily loosen this valve. Some air possibly may escape but this will not amount to anything. Then attach the pump and it will be found that it may be worked easily with one hand. After the shoe has been inflated, readjust the valve by screwing it down and test it for possible leaks.

Many times, screwing down the valve too hard destroys the rubber packing. A valve should be adjusted snugly, not too tightly, and if it leaks should be taken out and cleaned. A little dirt may prevent the valve from seating properly. Usually a suspected

Digitized by Google

member is thrown away when a cleaning would make the device as good as new.

DUAL IGNITION WITH ORDINARY PLUGS.

The advantages of a dual spark in the cylinder of an internal combustion motor have been pointed out from time to time in these columns but the installation of such a system usually necessitates the use of a double pole plug. A method of utilizing single pole or ordinary plugs is outlined at Fig. 2, but the hint can only be employed where dry cells or a storage battery are used and where the coil is equipped with two secondary leads; that is, each unit must have two terminals for the high-tension cables. Usually one of these is employed for grounding or for conveying the ground circuit of the coil to the frame of the car or engine as, for instance, with marine motors.

Where such a coil is in service the ground connection wire is removed from the second terminal and an additional high-tension cable attached, this lead being carried to the second spark plug, screwed to any convenient point in the cylinder head but preferably as shown in the drawing in order to obtain the highest efficiency. It should be borne in mind in locating the extra plug that the further apart the two points of ignition are the better. The diagram depicts a method for wiring the low-tension circuit as well, but this need not necessarily be followed and the existing low-tension circuit need not be changed.

The second terminal, which is taken advantage of for multi-point ignition, is simply the other end of the secondary winding to that connected with the usual high-tension wire, and in coils where it is not exposed in this way the low-tension circuit is made use of to carry the high-tension ground circuit, usually by the way of the timer.

WHEN THE WATER BOILS.

Frequently, in exploring roads unknown to the operator, highways are encountered which preclude the use of anything but the second or low speed, because of their dangerous condition. If the day be warm and the water shows a tendency to heat it is an excellent plan to remove the radiator cap before steam is generated, as by so doing considerable water will be retained in the circulation system that otherwise would boil out through the overflow pipe. When steam is made it displaces a certain amount of water if the cap be on the cooler. By operating with the cap off the steam will escape into the open air and it will be found that the water will not boil nearly as quickly as under normal conditions.

LIGHTING OIL LAMP SUGGESTION.

The average motorist has experienced the difficulty of lighting the oil lamps when these members are exposed more or less to a draught. As a usual thing the match blows out before the blaze is kindled and as a result several matches are wasted, as well as much time. A simple method of facilitating lighting is to turn the wicks up about half an inch before applying the match. This allows the kerosene to work up through that portion of the wick which was compressed. It will be found that the lamps will light easily as there is plenty of oil in the charred end of the wick.

ELECTRIC LIGHTING HINT.

With the growing use of electric lighting on the motor car the average motorist is apt to neglect precautions observed with the acetylene system. Those who do considerable night driving usually carry an extra burner but the same drivers fail to make provisions for trouble with an electric lighting equipment.

An instance of failure of the lighting system was noted recently by the writer, who came upon a car on a dark highway and in a place many miles from the destination of the machine. The automobile utilized the magneto to supply current to the lamps and it was not equipped with a gas tank or generator, the headlights being designed strictly for electricity. Although the system gave excellent service, the inevitable happened—one of the lamps burned out. Not having an extra one the owner would have spent several hours running home at a low rate of speed had not a fellow motorist furnished light for both cars. Extra lamps should be carried carefully wrapped in cotton batting and so placed in the car that they will not be subject to undue vibration.

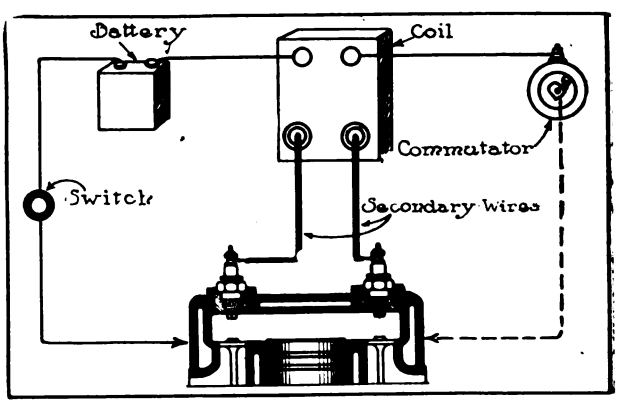

Fig. 2—Depicting Multi-Point Ignition with Single Pole Plugs.

PRESSURE FEED OILER TROUBLES.

Although gear driven oil pumps are employed largely with the modern car there are a number of older machines which are equipped with lubricating systems of the pressure feed design. This is an efficient system if properly cared for and kept clean, but as the flow of the oil depends upon the pressure in the tank and tight connections, it is obvious that a leak or a dirty check valve will cause faulty operation.

Digitized by Google

The system is an exceedingly simple one and is entirely automatic in its operation, oil starting to flow when the pressure from the exhaust fills the supply tank. Fig. 3 depicts the components of the system, and connections, etc., likely to impair its efficiency are also outlined.

In the event of failure of the oil to drop in the sight feed glasses even when the motor is accelerated, or the adjusting screws are loosened to supply more lubricant, the various connections should be examined, starting first with the tank. The filler cap should seat securely and have a leather or other suitable washer. The connection at the tank and those of the leads to the glasses should be tested for tightness and if upon readjustment of these oil fails to materialize, the pressure feed pipe and its connections should be inspected.

Disconnect the pipe next to the check valve and with the motor running note if there is a pressure; that is, if the impulses of the exhaust can be felt upon the hand. If not, the nipple in the exhaust manifold

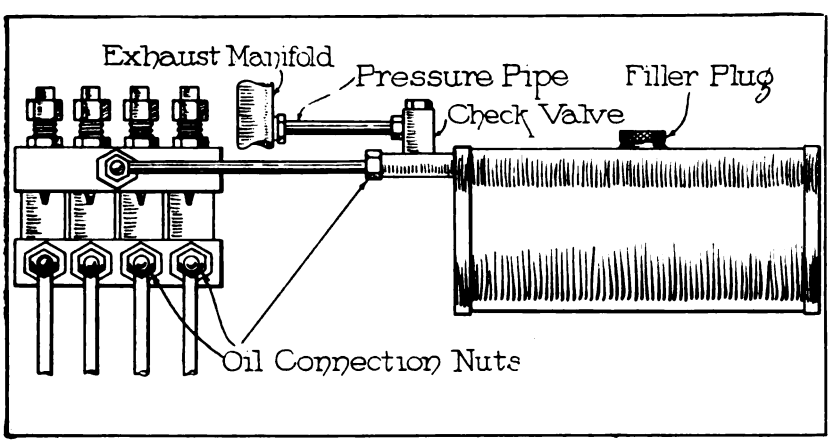

Fig. 3—Outlining Some of the Causes for Failure of Pressure Feed Oilers to Operate Correctly.

or pipe should be removed and cleaned. The nipple may be choked with carbon and soot. If considerable oil is fed to the motor, so that the exhaust smokes, the check valve near the tank is likely to be fouled. This should be taken apart and thoroughly cleaned, replaced and the engine again started for testing the pressure.

A simple method of quickly locating the fault of the system is to disconnect the pressure pipe at the tank and blow through the check valve member. If the tank and oil pipe connections be tight, oil will flow through the sight feed glasses and it will be obvious that the trouble is due to the exhaust not filling the tank with pressure.

Leaks may exist between the glasses and their holders and this is usually denoted by bubbling or leaking of the lubricant around the sight feed device. In disassembling and readjusting this member care should be exercised, as the glasses are broken easily. It may be tested for tightness by placing the fingers over the oil openings and blowing through the opening through which the lubricant flows from the tank. If a glass becomes broken while on the road the screw member should be turned down snugly shutting off the pressure, else the operation of the other feeds will be affected.

NEW FORM OF GOGGLES.

A new type of goggles has been brought out by an English concern, these being equipped with tinted glasses which exclude all the harmful and trying blue and violet rays and allow only the comforting pale yellowish green rays to reach the eyes. The strong, bright light when driving in an open car, causes a continuous contraction of the eyelid muscles, creating fatigue and headache, as well as exerting a harmful effect on the sight. Smoked glasses have been employed but many object to them owing to the depressing effect upon the wearer. The Chlorophylle glasses permit operation over white glaring roads without discomfort, as it is claimed that eyes can be kept wide open no matter how strong the glare.

GRINDING IN JETS.

Although the average motorist does not care to tamper with the jet of a carburetor, these members sometimes require grinding in. This is a delicate task and is best left to the expert repairman. If the jet require attention it may be ground in by using a small amount of brass polishing composition or jeweller's rouge made into paste. The needle should be rotated with a very light pressure and raised from time to time to allow the mixture to change position, as well as prevent scoring. Sometimes the throttle does not move easily, due to dirt or the metal corroding. This may be cleaned with a brass polish which will remove the incrustations, as well as foreign elements.

AN EMERGENCY RADIATOR REPAIR.

Many novel methods of making temporary repairs to a damaged radiator are noted but one of an unusual nature is given by a repairman who was sent to the scene of an accident to tow home a machine. The radiator was badly damaged and the repairman set about to make a temporary repair. A nearby farmhouse supplied a number of raw potatoes which were cut in two and the openings in the cooler filled. The latter held water so well that the motor was started up and the machine ran to the garage under its own power. Small leaks could be stopped thus, as the potato will retain its sealing qualities even if water in cooler becomes very warm.

DETERMINING CHAIN LENGTHS.

The usual method of determining the chain length when the pitch, the centre distance, and the number of teeth on the two sprockets are known, is by a formula, but where this operation must be repeated many times a day, the time consumed is considerable. At Fig. 4 is shown an instrument designed and used by the Diamond Chain and Manufacturing Company, Indianapolis, Ind., by which chain lengths can be determined quickly by making three simple adjustments.

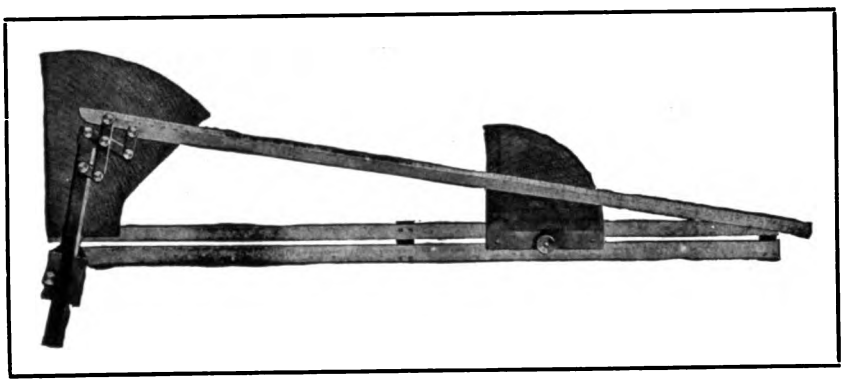

Fig. 4—Diamond Device Computing Chain Lengths by Three Adjustments.

The instrument in its simplest and cheapest form is shown in Fig. 5, where the parts are made of paper. The fixed scale C is laid off in half-inch divisions, each representing a distance equal to the pitch of the chain. On the movable scale E, each half-inch division represents a distance equal to two pitches—one for the upper half of the chain, and one for the lower. The circles on the sectors A and B are the pitch circles of one-inch pitch sprockets drawn half size. Points on the spirals are found by stepping off .5-inch chords on each of the pitch circles beginning at the horizontal radius to the left of C and to the right of F. Through all points one step removed from the horizontal radius, a curve is drawn and marked No. 2. Through all points two steps removed, a curve is drawn and marked No. 4, and so on. The number of any spiral represents the number of chain links from the point where it crosses a given circle to the corresponding point on the lower half of the circle.

As an example, in the use of the .75-inch instrument, let the distance between the sprocket centres be 15 inches, the pitch .75-inch, and the number of teeth on the large and small sprockets, 72 and 36, respectively. Divide the centre distance by the pitch. The result is 20, which is the centre distance in terms of the pitch. Set the sector A at this figure on the scale C.

Now, find the pitch circles on A and B corresponding to 36 and 72 teeth, respectively. Place the straight edge E approximately tangent to these two pitch circles, and, noting the points where spirals cross these pitch circles, shift the straight edge E so that it covers all but one of these points. See that the zero point on the scale coincides with the point not covered on the left hand dial, and that the point not covered on the right hand dial just touches the straight edge. In other words, place the straight edge in the position that the centre line of the chain would occupy in passing from one sprocket to the other.

Take the straight edge reading 38, which is twice the number of links in the span of free chain. The number marked on the spiral passing through the zero point is 44. The number marked on the spiral passing through the right hand reading is 14. The sum of these three numbers is 96, which is the chain length in terms of the pitch, $96 \times .75 = 72$ inches, which is the chain length in inches.

As the length of a roller chain must in general be a multiple of twice the pitch, the reading on the straight edge E must be an even number. If then the spiral does not pass exactly through one of the even numbered scale divisions, the next higher even number must be used. If an offset connecting link is used this number must be odd. If the chain is of the block type, the reading may either even or odd.

In the steel instrument shown in Fig. 4, the adjustments are greatly facilitated. The right hand sector is quickly clamped in position by a thumb screw,

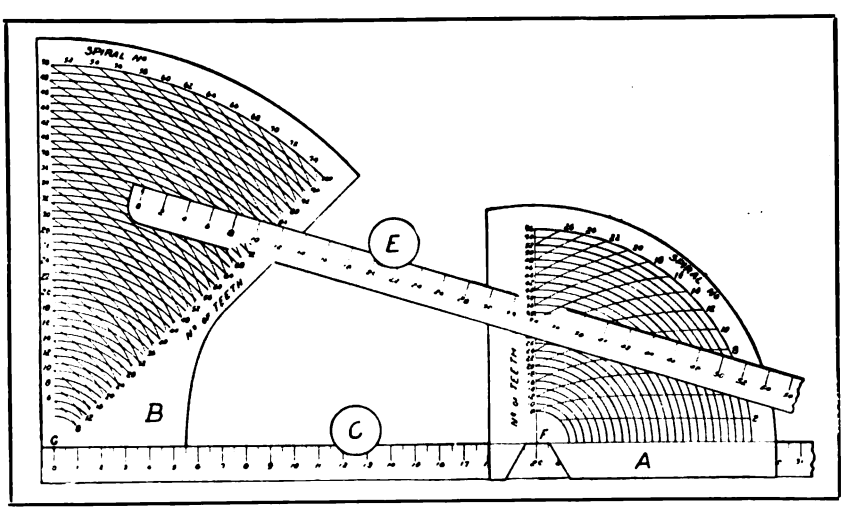

Fig. 5—Measuring Device Constructed of Paper, Also Outlining Scales.

the zero point of the straight edge is brought to the proper pitch circle by the slide which is graduated on the left for roller chains, and on the right for block and twin roller chains.

MOTORISTS AND GOOD ROADS.

If, as it would appear from the statistics available, the motorists of America paid some $4,000,000 in registration fees during 1911, it follows that they have a substantial interest in the subject of good roads. Whatever may have been the original reason for imposing a special tax on this class of highway users, it has come to be generally recognized that the chief cause for increasing the fees from year to year lies in the supposed damage that results to the road surfaces by the swiftly moving vehicles. Leaving aside all disposition to question the truth of this assertion, it is proper to consider whether or not those who have charge of disbursing the fund thus created are giving the best possible return for the money.

It must be admitted that organized motorists have been responsible mainly for the agitation which has resulted in bringing this matter to the attention of those who were once its most rabid opponents, but now equally as interested in securing the benefits to be obtained as the automobilists themselves. It has been largely an educational campaign, and thus far only the rudiments have been learned. The really serious study has yet to be begun.

Good roads meetings and conventions have been held in every section of the country. They have been and doubtless still are of inestimable value in bringing the subject to the attention of those who have given it little thought heretofore, but there is great need for a more systematic application to details. Several forms of permanent road building have been tried out under varying conditions in this country and abroad, and it is time that the motorist give close attention to what has been accomplished along this line.

It is no doubt true that those who have been most directly connected with the campaign are thoroughly conversant with the results which have been obtained, but past experience indicates that it is from the rank and file of the organization that the proper agitation is to come. The individual motorist has been interested in the subject of good roads and has carried his interest into personal endeavor. When he becomes properly informed as to what is needed in the way of permanent road surfaces he will be able to make his position felt as keenly, as has been his demand for better ways. It follows that the individual automobile owner, as well as the organized body of motorists, should take advantage of every opportunity to study the methods now employed and seek to apply them wherever practicable. Plenty of opportunity will be afforded if the tourist keeps his eyes and ears open during the coming season.

PLACING THE RESPONSIBILITY.

Upon his plea of guilty to a charge of manslaughter a motorist in Massachusetts was sentenced recently to serve from five to seven years in prison. Information revealed to the court indicated that this was the prisoner's seventh violation of automobile speed laws. The situation offers room for comment as to how it could be possible that a man who by his previous actions had given sufficient indication of his reckless disregard for the rights of others was still permitted to drive a motor car.

Such operators bring discredit upon the whole body of motorists, and the immense majority which recognizes in them an ever present source of danger, has a direct interest in desiring that their number shall be reduced to an absolute minimum. But most of all there will be general demand that the responsibility be transferred from those who earnestly strive to obey the law in this regard, to those whose duty it is to see that the existing laws are properly enforced.

New York City has been experiencing considerable reckless driving of late, and as is more or less characteristic, those in authority, instead of seeking to apply existing speed regulations, have been urging

Digitized by Google

more drastic legislation. Motorists hold that what is needed is not more laws but an actual attempt to enforce those now on the statute books.

That this latter statement is true is borne out by the fact that organized motorists throughout the country are lending every aid to the constituted authorities in this matter. In Detroit, for instance, three prominent members of the local club, one of them the president, have been sworn in as special speed officers to serve without pay. The responsibility does not rest upon the shoulders of law abiding automobile owners, but upon those whose duty it is to see that the reckless driver is deprived of his license to operate, particularly when it has been demonstrated so conclusively that he has lost all regard for the other users of the highways.

THOSE CHARITABLY INCLINED.

The annual orphans' day outing, which has become a permanent feature with many of the local automobile clubs throughout the country, has served to indicate how generously motorists are willing to respond to an opportunity to give pleasure to those less fortunate than themselves. It may be suggested in this connection, that these opportunities are really much more frequent than is sometimes realized. Undoubtedly physicians will be glad to furnish the names of patients to whom a ride in the open country, and particularly in an automobile, would prove a decided blessing.

In the early days of the automobile, the novelty of riding in them was much better appreciated. Nowadays, so many machines are being operated and so many persons have come to consider them as a necessary part of the daily life of the community, that few realize there are still a large number of people who have never experienced the pleasure. It is probable that the novelty of the ride, combined with the fresh air thus obtained, would work wonders upon the convalescent. In fact, the scheme is being tried in several cities with excellent results, and it offers a method of doing good which costs the donor almost nothing.

MOTOR TRUCK AND HORSE PARADES.

Springfield, Mass., inseparably connected with the early history of the motor car industry, has just held a work horse parade. New York, Newark, and a host of other cities throughout the country hold annual commercial vehicle demonstrations of this nature. This is not necessary in Springfield, since the number of mechanical transports which pass up and down Main street every day in the regular course of events is in every sense a parade. Even the fire department is so completely motorized that the horse is practically extinct.

Motor truck parades are held for the purpose of calling the attention of business men to the varied uses to which the modern transport may be put. A work horse parade is something of a novelty. Perhaps Springfield, which has become a pioneer in the development of so much that is connected with the automobile industry, seeks to establish a precedent along this line, realizing full well that the time is soon coming when it will require some such demonstration to remind the public that it once depended upon the low efficiency equipment to take care of its transportation problems.

VALUE OF THE TRADE MARK.

The trade mark is the purchaser's guarantee against substitution of inferior goods. The careful motorist will realize the importance of this, and as a result will not fall an easy prey to products which have no established reputation, on the plea that they are just as good and can be bought for less money. It is false economy to experiment with unknown goods, when the future efficiency of the car and its components are considered.

Too much stress cannot be laid upon this point. Manufacturers who have expended large sums in experimenting with the result that they have perfected a product on which they are willing to base their reputation by an extensive advertising campaign are in a position to recommend that which is best for the individual motorist. The frequency with which automobile owners have been victimized of late makes it obvious why absolute dependability should be placed upon the trade mark.

In many instances it has been found imperative by the manufacturer to place his goods upon the market in sealed packages. Every safeguard is being thrown about the motorist, and if he fails to secure that for which he expends his good money it is largely his own fault. Apparently, the American people have yet to learn that dependable goods cannot be purchased for less than the standard price and that the manufacturer's trade mark is the purchaser's protection against fraud.

IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

SAMPSON HAULS HOUSEHOLD GOODS.

From New York to Baltimore with a full load of household goods is a trip which should tax the capacity of any vehicle. The distance is 180 miles, going by the way of Trenton, N. J., and Philadelphia, and J. Edwin Hood recently made the journey with a Sampson truck, the product of the Alden Sampson Manufacturing Company, Detroit, a constituent of the United States Motor Company, New York City, in 15 hours, running time. Only one stop was made.

This is believed to be one of the longest motor truck household removals on record. Mr. Hood is engaged in the transfer business, and the trip proved of particular interest to many persons who are watching the progress of long distance transportation by commercial vehicles.

PIERCE-ARROW IN HONOLULU.

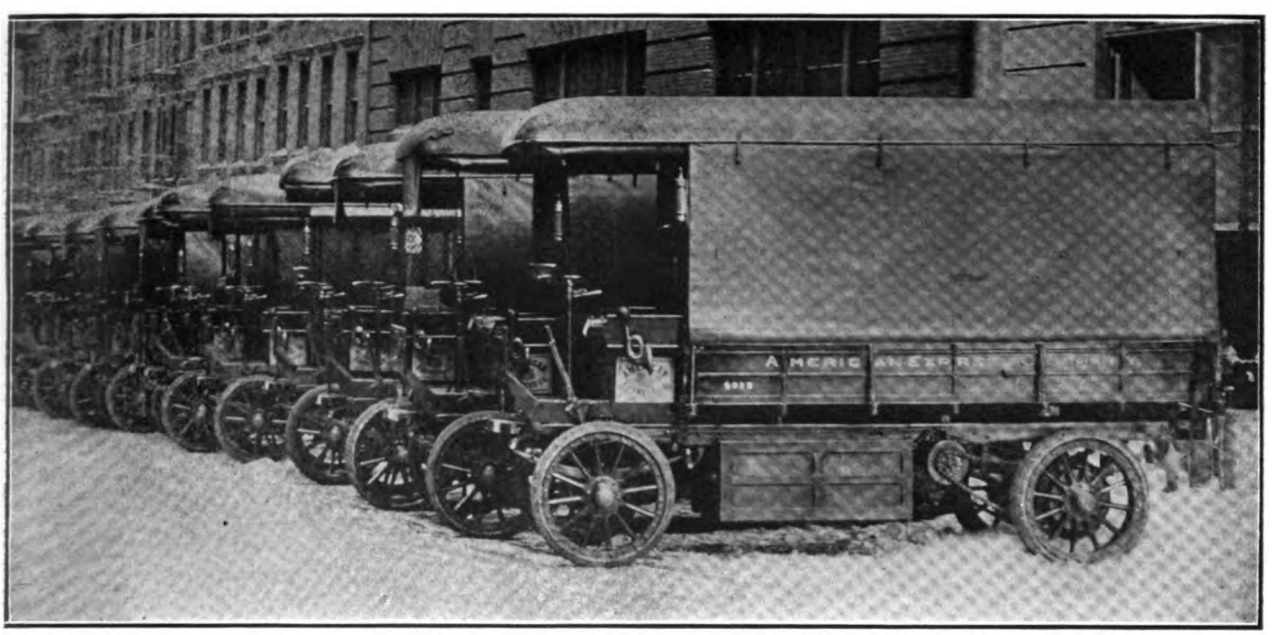
While the climatic and road conditions in Hawaii have been found to be admirably adapted to the use of the pleasure car, it is stated the first commercial vehicle to make its appearance in the city of Honolulu is a five-ton Pierce-Arrow truck, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., for the Oahu Ice & Electric Company and recently placed in commission. The car is shown herewith, and it will be noted that it was constructed especially for the work it was expected to undertake, at least insofar as the body was concerned.

Taking into account the fact that the vehicle was to operate in a tropical temperature, provision was made to protect the driver from the beating rays of the sun. The floor and sides of the interior, the latter to a height of 24 inches, are covered with heavy zinc plate, this forming a tank to catch the water from the melting ice and prevent it from coming in contact with the mechanism of the chassis. This tank is drained at the front, and the zinc plates are thoroughly protected from injury by means of wooden gratings. The body is sufficient in proportions to carry 36 cakes of ice of standard size.

As is more or less well known, the Pierce-Arrow truck is fitted with worm drive, the pioneer vehicle to be thus equipped in America. This form of drive has been tested out under all sorts of conditions abroad, and the experience of the Pierce-Arrow company during the past year and a half, has been such as to indicate that it made no mistake in deciding upon the innovation here.

The five-ton model is fitted with a four-cylinder, water-cooled motor. The cylinders are cast in pairs with bore of 4.875 inches and stroke of six, giving an S. A. E. rating of 38 horsepower. Ignition is dual, consisting of Bosch high-tension magneto and battery. The carburetor is a special design, automatic in action, the feed being by gravity. Lubrication is by forced feed system.

The clutch is of the cone type. The transmission is selective, affording three forward speeds and reverse. Two sets of brakes are



Pierce-Arrow Worm Driven Vehicle Recently Placed in Service with Honolulu Ice Concern.

Digitized by Google

provided, the foot brake being on the outside of a drum at the rear of the transmission and the equalized hand brakes on the inside of the drums on both rear wheel hubs. Springs are semi-elliptic. Tires are 36 by five inches single in front, and 40 by six inches dual in the rear. The wheelbase is 13 feet and the tread 69 inches.

BAKER ELECTRICS FOR EXPRESS.

Several of the well known express companies throughout the country have adopted the electric vehicle as standard equipment in making deliveries. One of the most recent orders placed with the Baker Motor Vehicle Company, Cleveland, O., maker of the Baker electric, was a repeat from one of these concerns, for 28 two-ton cars for use in Washington, Baltimore, New York and Chicago. Part of the fleet of

Part of the Fleet of Two-Ton Baker Electric Vehicles Operated by the American Express Company in New York City.

two-ton Baker electrics operated by the American Express Company in New York City, is shown herewith.

In these cars the motor is a special four-pole design, series wound, with unusually large commutator, which is claimed not to spark or blacken under the heaviest load and to possess an electrical characteristic which permits of 300 per cent. overload. The motor and countershaft are completely self-enclosed in dust and water proof cases. They are connected by Reynold silent chain, which is enclosed and runs in oil. The armature shaft and countershaft run on imported annular ball bearings, four of which are employed for the latter to provide against distortions.

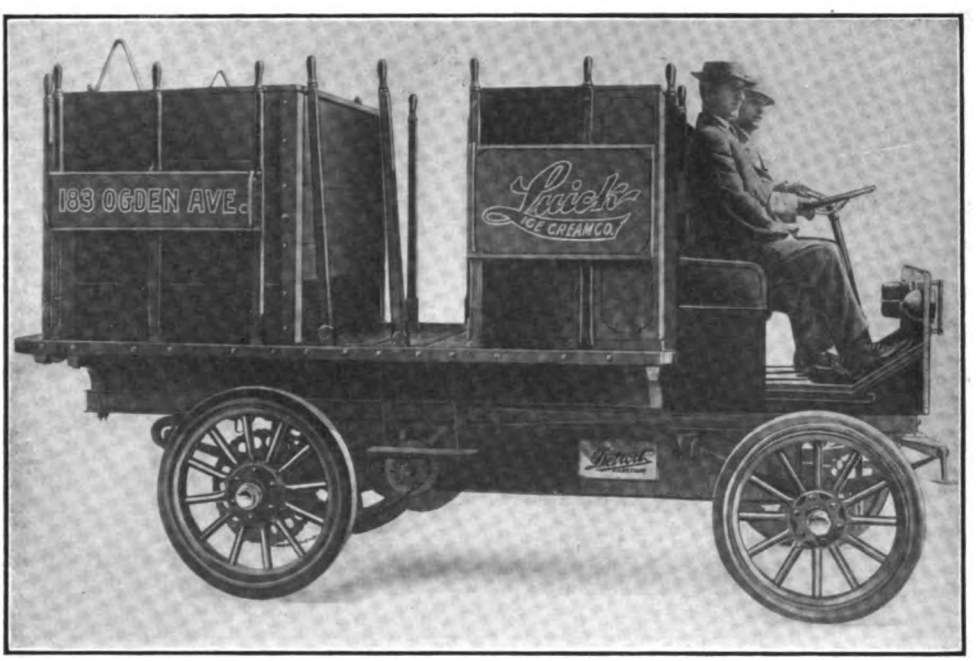
The steering gear and controller are connected in a very compact manner, and are rigidly attached to the chassis. The controller is a patented continuous torque, drum type, and is enclosed in a dust and water proof case. Five speeds forward and reverse are provided. No pedals or switches are used with this controller, and all speed changes are gradual and accomplished without waste of current.

Special attention has been paid to the matter of wiring, this being rendered acid and weather proof and so arranged as to be free from all mechanical strains. All connections are securely blocked. Every part of the working mechanism requiring attention, adjustment or lubrication is made conveniently accessible from the outside of the vehicle without disturbing the body or the load.

The frame is of pressed steel of special design, giving unusual strength and lightness. A particular method of chain drive is employed, permitting the flexible suspension above the springs of the entire power plant, and a light and strong rear axle construction. Both axles are drop forged steel with integral spring seats, and are equipped with roller bearings of standard design.

DECATUR REPLACES HORSES.

George E. Sturdevant of Danbury, Conn., who has been engaged in the trucking business in that city for a number of years, has decided to purchase motor trucks in the future instead of horses. After experimenting for the past year, Mr. Sturdevant has come to the conclusion that mechanical transports are far superior to horses in his business.



Recently, he decided that he must add to his equipment and after giving the matter sufficient study, gave an order to the Fillow Auto Company, local agent

Digitized by Google

for the Grand Rapids Motor Truck Company, Grand Rapids, Mich., for a two-ton Decatur Hoosier Limited. The chassis was fitted with a handsome black body by J. R. Vrendenburg of Danbury. Mr. Sturdevant says his investigation leads him to believe that through this purchase he has saved the price of two and possibly three horses.

ALCOS FOR CITY WORK.

The city of Pittsburg, Penn., has purchased three six-ton Alco trucks, made by the American Locomotive Company, New York City, which will be used by the municipal authorities in hauling asphalt. It is maintained that the decision involves a saving of $15,000 a year over horses. The order came after a rigid investigation and tests, which proved conclusively that the mechanical transport could do the work more efficiently, and of course with greater economy. The trucks will be equipped with bodies designed especially with a view to securing quick loading and unloading, and it is estimated that each will carry sufficient material for seven square yards of street surface.

Detroit Electric Wagon Utilized by Luick Ice Cream Company, Milwaukee, Wis.

LARGE ORDERS FOR WAVERLEYS.

Following the recent order for 20 Waverley electric light delivery wagons, made by the Waverley Company, Indianapolis, Ind., placed by the Fleischmann Yeast Company, New York City, which are now in service, comes an additional order for a two-ton vehicle from that concern. A fleet of 10 cars on the same Waverley chassis has been received from the Mandel Bros. Department Store in Chicago, and four have been ordered for Louisville. The demand for these light delivery machines is held to be due largely to the fact that they are absolutely noiseless in operation, while their efficiency and economy have been proven under all conditions of service.

SPECIAL ICE CREAM BODIES.

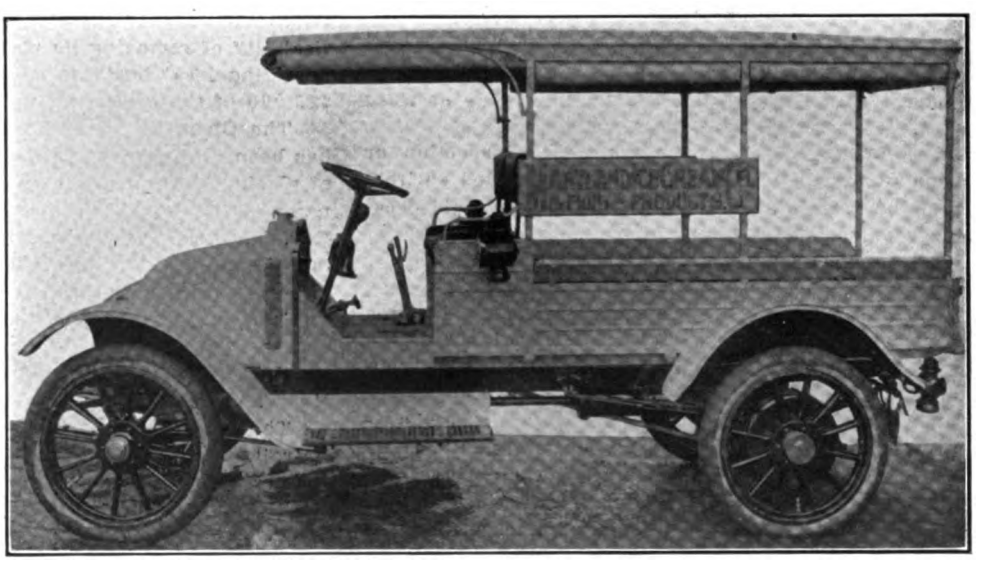
The marketing of ice cream is a decidedly seasonable subject, and it is significant that the motor truck is being utilized for this purpose in largely increasing numbers throughout the entire country. The business offers some special features, which have proved more or less difficult of solution, but the manufacturers have given it such close study and application during the past year, that it is possible to secure what is needed from several truck makers.

In the first place, the deteriorating effects of the melting ice, mixed with salt, upon the metal of the chassis, made it necessary to overcome this difficulty. The use of zinc plates, or some other similar material, has done away with this danger, however, and there practically is no reason why a truck utilized in the delivery of ice cream should not give the same degree of service that would be possible in many other fields.

The next problem may be said to be that of arranging for carrying a maximum load, and thus securing the greatest efficiency, which means the utmost economy, from the vehicle in service. It has been proven to the satisfaction of most business men, at least, that there is undoubted economy in the use of the mechanical conveyance. The degree of saving is measurable, however, in direct proportion to the total amount of time the car is engaged in useful work.

Ice cream is delivered in tubs or pails, and it is somewhat difficult to pack these so as to make use of the available space in the most advantageous manner. Body designers have overcome this in a number of ways, and it will prove of interest to note how this has been accomplished in specific cases.

Electric Car in Milwaukee.



Herewith is presented a photograph of the 3000-pound Detroit electric wagon, made by the Anderson Electric Car Company, Detroit, and in service with the Luick Ice Cream Company, Milwaukee, Wis. It will

Digitized by Google

be noted that ample provision has been made for overcoming both difficulties mentioned above. The special containers are so constructed as to protect fully the chassis mechanism, and to afford the utmost room for packing the ice cream. The body platform extends over the wheels, so as to provide additional carrying capacity, and the entire assembly is neat and attractive.

The Luick company favors electric vehicles for this work, because it feels that the nature of the ice cream business is such that the electric can be utilized to a much better advantage than the gasoline propelled car. This is due primarily to the number of short stops required on most of the delivery routes. There will be no denying that electrics have a distinct field, but there probably will be disposition to question the opinion of this concern with reference to the above statement. In fact, it must be admitted that many gasoline cars are utilized in this work and with splendid success, despite the numerous short stops encountered.

There is no reason for assuming that the experiences of all should be exactly alike. It is sufficient for the purposes of this discussion to note that the Luick Ice Cream Company has had its Detroit electric truck in service for a number of months, and that it has covered from 30 to 40 miles daily without difficulty and with an excellent showing for economy and efficiency. In its operation two men are employed, and this makes it possible to serve a large number of patrons, including stores and private consumers, in the course of a day.

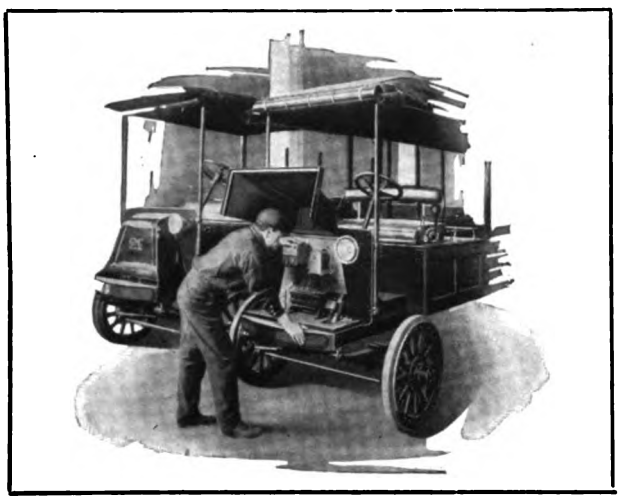
Lippard-Stewart Truck with Express Body Built Especially for a Baltimore Ice Cream Company.

As is true of all Detroit electrics, the car is equipped with the Edison battery, this particular set consisting of 60 A-6 cells. The wheelbase is 96 inches; the tread 62, and the road clearance 11.5. The overall dimensions are: Length, 155 inches; width, 74; height, 100. The height of the platform from the ground is 35 inches. Tires are solid, 34 by 3.5 inches in front and 36 by four in rear.

Gasoline Cars Also Successful.

The Lippard-Stewart 1500-pound wagon utilized by the Maryland Ice Cream & Fruit Products Company, Baltimore, Md., also shown herewith, was designed especially for this concern by the maker, the Lippard-Stewart Motor Car Company, Buffalo, N. Y. It will be noted that provision is made for completely enclosing the interior, should occasion demand, while the arrangement of the flare board sides is such as to afford ample loading space. It is painted a neat cream and brown, presenting a decidedly attractive appearance.

This type of vehicle is meeting with favor in many sections. In fact, the Lippard-Stewart company has been called upon to deliver a large number of these cars during the past few months. One firm, the Hoefler Ice Cream Company of Buffalo, recently purchased five. These were designed particularly to take care of the retail trade and were of the enclosed panel body type.



In the face of these facts, it hardly can be maintained that the gasoline vehicle is not altogether suitable for the retail delivery of ice cream. Still, as said before, conditions vary and what will prove to be the best for one concern may not necessarily give the same results under other circumstances. It is necessary to learn all of the conditions under which a vehicle is to operate before making decision as to the type to be employed.

It may be stated that the Lippard-Stewart cars are equipped with a four-cylinder, four-cycle, water-cooled motor, cast en bloc, with bore of 3.375 inches and stroke of 4.312. Ignition is by Bosch magneto. Lubrication is by force feed and splash. The clutch is of the disc type. The selective transmission affords three speeds forward and reverse. Two sets of brakes are fitted, expanding and contracting on the rear wheels, lined with Raybestos. Springs are full elliptic in front and semi-elliptic, with auxiliary coil springs, at the rear. Tires are pneumatic, 34 by four inches, all around, mounted on Universal quick detachable rims.

A special feature of the construction is the radiator mounting and hood. The former is located at

Digitized by Google

the rear of the motor, next to the dash, where it is held to be entirely out of danger from possible collision or other accident. The hood lifts from the front,

Depicting Accessibility Afforded by New Type of Hood on Latest G. M. C. Electrics.

and completely exposes the motor for inspection or adjustment, while the latter may be removed entirely from the chassis in a very few moments, should occasion require.

THE NEW G. M. C. ELECTRIC.

According to C. L. Morgan, sales manager of the electric division of the General Motors Truck Company, the new G. M. C. electric, designed by John Lansden, has at least 18 important features, embodying the maximum of accessibility and simplicity. Some of these are outlined as follows: Rear springs outside of the frame to insure maximum axle strength, permitting the use of a narrow frame and giving short turning radius. The steering post is inclined. Double brake equipment is provided, each brake locking at wheel. Auxiliary springs supplement the rear semi-elliptic members, and an apparatus or controller hood is placed in front of the dash.

This latter is designed somewhat along the lines of the so-called Renault hood for gasoline cars. The accompanying illustrations bring out this exclusive feature. It will be noted that the controller, safety switch, ampere-hour meter, lamp circuits, etc., are all instantly accessible by lifting this hood. It is maintained that this location means a great deal to the garage man, because the controller has been so placed that adjustment and inspection of each and every finger is made readily. The whole assembly is amply protected by a heavy oak bumper, substantially ironed.

Another feature is the location of the battery on top of the frame under the driver's seat. This has been decided upon as eliminating unnecessary labor and removing all possibility of accident by dropping of battery crates, or short circuiting due to hanging wires, etc. In addition, the battery is in plain sight, so that the caretaker does not have to work through a trap door or around corners to get at the cells. It is claimed that the battery is assured of the best possible care under this arrangement. The housing is properly ventilated, as well as being protected against excessive chilling, two factors which make for long life and the greatest efficiency possible.

NEWS OF THE TRUCK FIELD.

The Chase Motor Truck Company, Syracuse, N. Y., has added a new model to its already extensive line. This is a 500-pound delivery wagon with open express body, equipped with a two-cylinder, two-cycle, air-cooled motor, rated at 12 horsepower, the bore being 4.125 inches and the stroke four. Ignition is by Bosch magneto.

The Seamless Pressed Steel Company, Redkey, Ind., which has been producing trucks in a small way for some time past, is said to be considering the advisability of removing its plant to Hartford City, Ind., providing local business men can be induced to take $25,000 of the capital stock of the concern.

The Cleburne Motor Car Manufacturing Company has been organized at Cleburne, Tex., for the purpose of placing in the market two small vehicles under the name of Chaparral. The president of the company is Rev. H. E. Luck, who has been engaged in developing the product for the past two years. The other officers are: Vice presidents, E. N. Brown and F. L. Deal; secretary, R. H. Crank; directors, J. E. Poindexter, Brown Douglas, G. A. McClung, S. B. Norwood, E. N. Brown, O. L. Bishop, R. E. Gatewood, J. M. Moore, A. C. Barber and F. L. Deal.

The Ware Vehicle Company, formerly located in Detroit, where a four-wheel drive truck was manufactured, has secured temporary quarters at 771 Raymond avenue, Minneapolis, Minn., and is conducting negotiations with H. J. Tremain of the Minneapolis Commercial Club, for the erection of a suitable plan-

Controller, Safety Switch, Ampere-Hour Meter, Etc., Instantly Revealed for Inspection and Adjustment.

Digitized by Google

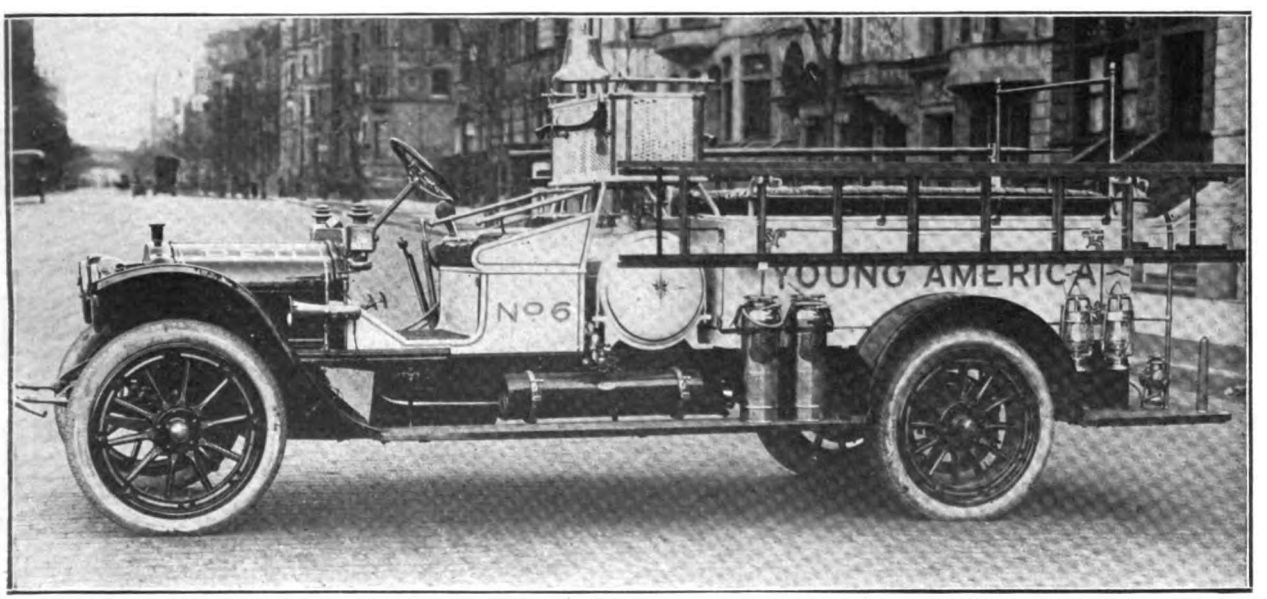
The Auburn Automobile Company, Auburn, Ind., is to place a two-cylinder light delivery car in the market in the near future. The first machine is under construction, and will be rated at 1500 pounds capacity.

The Lambert-Morin Motor Vehicle Company, Lawrence, Mass., has been experimenting with electric trucks for the past three years, and is now placing machines of its own design upon the market.

The Cincinnati Motors Manufacturing Company, Cincinnati, O., has 25 commercial cars under construction, and intends to erect a suitable plant for the production of Alter trucks during the coming summer. The officials of the company are: President, Franklin Alter; vice president and general manager, H T. Alter; treasurer, J. B. Doan.

The Jackson Automobile Company, Jackson, Mich., is said to be contemplating the production of a 30 horsepower light delivery wagon, equipped with solid tires of a special construction, capable of giving the same resiliency as pneumatics.

The Spaulding Manufacturing Company, Grinnell, Ia., a large and well established maker of carriages, is to enter the motor truck field with a light delivery wagon. Several experimental machines have been constructed and have given decidedly efficient service.



The Oakland Motor Car Company, Pontiac, Mich., is expected to announce a 1500-pound, 40 horsepower delivery wagon in the near future. Four of the machines have been in daily use about the Oakland plant for some time, and their work has included the hauling of supplies from Detroit, a distance of 25 miles.

G. M. C. GASOLINE VEHICLES.

One hundred and thirty-three G. M. C. gasoline trucks, made by the General Motors Truck Company, Detroit, are used by merchants in San Francisco, Cal., according to recent information. The largest number owned by any one firm is eight, and the next, five. There are several who employ two and three. Among the lines represented may be noted the following: Steel, ice, hardware, furniture, transfer, wine, gas, brewing, electric light and power, etc.

WHITE FIRE WAGON SUCCESSFUL.

An accompanying illustration presents the combination chemical engine and hose wagon delivered by the White Company, Cleveland, O., to the Young America Hose Company of Poughkeepsie, N. Y., in November, 1911. The equipment is fitted to a regulation White chassis and includes everything required for the proper fighting of fires, the main idea being to stop the blaze before it has reached definite proportions. The Poughkeepsie company answers every alarm in the city, and writes that it has never experienced any trouble whatsoever.

White Combination Chemical and Hose Wagon in Service with the Young America Hose Company in Poughkeepsie, N. Y.

In every respect the machine has surpassed all sections of the guarantee given by the White Company when it was purchased. It climbs the hills of the city with ease, and as for speed, it has developed as high as 55 miles an hour on the long runs into the suburbs. Although some of the streets in these outlying districts were in decidedly poor condition, the mud often being hub deep during the spring months, the White fire wagon travelled over them easily.

The item of expense always is of interest, and President Lewis A. Thomson of the Young America Hose Company says the total cost of maintenance for the first five months was exactly $1.49.

TYPES OF REAR AXLE CONSTRUCTON.

(By R. S. Lane, M. E.*)

THE large number of inquiries constantly received by trade papers covering the automobile field is ample evidence of a considerable lack of knowledge

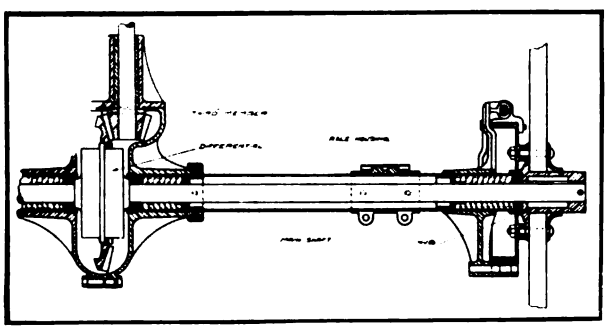

Fig. 1—Live Type Axle in Which the Shaft Is Supported by Bearings at Each End.

on the part of the reader concerning rear axle construction on the motor car. In view of this fact it is quite pertinent that the writer should endeavor at this time to express as far as possible in non-technical language some of the chief advantages of the various types, as well as to give a description of each type sufficiently clear to enable those advantages to be understood. It is scarcely possible to answer in a few words the direct question of a reader for such attempt invariably is misleading, due to the fact that so many things have to be left to the imagination or be so briefly described as to practically amount to no description at all.

To some it may seem strange that a general ignorance should prevail in connection with what might be termed one of the simpler parts of the automobile. Some of this surprise, however, with respect to the layman can be laid aside when it is considered that the confusion of terms and lack of understanding of the principles of the various types extends even to the builders of the cars themselves and back of them to the makers of the axles on which the cars are mounted. This is quite apparent from advertisements which have been published within the past few months and in which terms have been used without explanation and in a manner to be strongly misleading.

The best way perhaps, to arrive at our goal in the present discussion will be: First, to give a definition of the major term "floating"; second, to give a description of the various axle types, and third, to point out a few features relative to their bearing equipment and other items of practical value to the owner.

Definition.

The term "rear axle" is ordinarily used to designate the entire rear construction including the axle housing, differential, driving shaft, hub, etc. The "main shaft" or "main driving shaft," of which there are two for each "axle" is the rotating member extending from the middle of the axle or the differential, out to the hub, and which is wholly enclosed by the axle housing or tube. The "third member" or "propeller shaft" is placed at right angles to the main driving shaft, carries the driving pinion at its lower end meshing with the ring gear, and extends forward from the differential to the transmission or gearcase, assuming that the latter is a unit by itself and is hung midway in the frame of the car by cross members.

The feature which determines whether the axle is of the floating type or not consists only in the method by which the main driving shafts are supported at either end. In other words, the axle "floats" to just the extent that it is relieved at each end from all working forces in any direction in any plane through its axis. The forces involved can consist either of a radial pressure (through contact with a bearing) or a bending force, due for example to the hub end being coupled rigidly to the wheel. The latter construction, of course, would necessitate the axle shaft being so held as to resist thrust or side pressure.

Live Type.

The first axles on motor cars were all of the "live type." This term was simply used to distinguish the axle from the "dead" or non-rotating axle. Its construction involves simply that the main shaft be supported by bearings at each end, as at Fig. 1. These bearings were placed inside the tubing and ran directly on the axle shaft. The weight of the car was carried from the spring support through the bearing at the outer end, into the wheel and to the ground. At the inner end the differential was simply hung on the two projecting ends of the main shaft.

Semi-Floating.

Desiring now to better support the differential

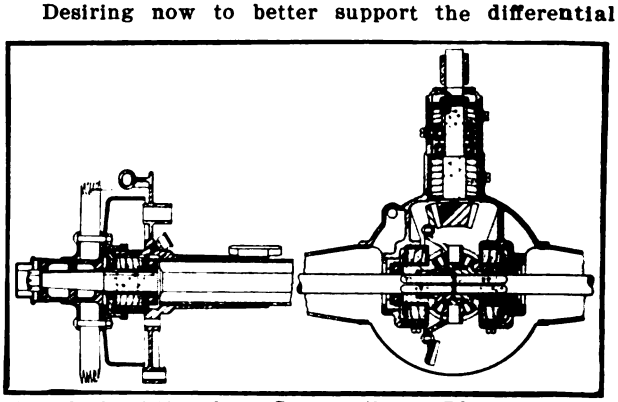

Fig. 2—Semi-Floating Construction: Differential Is Mounted on Bearings and Inner End Shaft Is Relieved from Forces Other Than Torsional in Transmitting Power.

gears it was decided that advantage would be gained by projecting either side of the differential case in the form of a hub and mounting the anti-friction bearing on each hub. In this way the differential

*Chief engineer, Hyatt Roller Bearing Company, Detroit.

Digitized by Google

case, and hence the whole differential was held in correct position within the entire housing, as indicated at Fig. 2. The work which the inner end of the main shaft now had to perform was simply that of transmitting power from the differential to the wheel, instead of having to carry the weight of the differential in addition as it had heretofore. This, therefore, relieved the inner end or half of the main shaft from forces other than torsional as above mentioned, and consequently gave us what we have long called "semi-floating" axle construction.

Three-Quarter Floating.

Looking now at the hub or outer end of the main shaft we find that these can be relieved here also, of some of their radial and bending load by mounting the bearing outside of the axle tubing as in Figs. 3 and 4. This construction involving the use of only one bearing as heretofore, has recently become quite

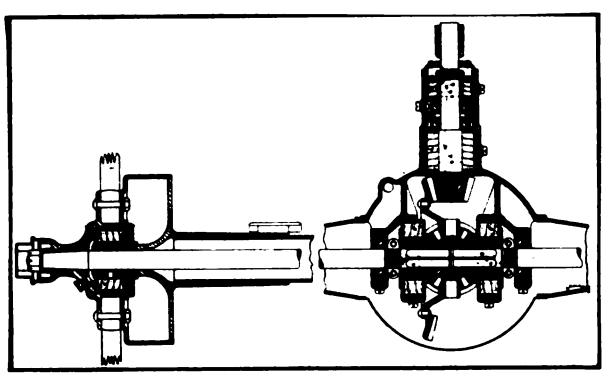

Fig. 3—Three-Quarter Floating: Outer End of Main Shaft Is Relieved from Radial and Bending Loads by Mounting Bearing Outside of Axle Tubing.

popular both in this country and abroad. When used the main shaft no longer has to carry the weight of the car as in live or semi-floating types of axles. It is necessary, however, that the shaft give some support to assist in keeping the wheel in an erect position as the single bearing used is not designed to withstand alone all of the skidding or side stresses to which the wheel may be subjected.

When withdrawable shafts are desired this feature can be obtained by the use of an extra thrust bearing, as illustrated at Fig. 4, or—without the thrust bearing—the shaft can be removed together with the wheel by jacking up either one side or the other of the car and removing the split collar at the differential through the cover plate, also as illustrated. In neither case is it necessary to remove the entire rear construction from the car in order to get at either the differential or the main shaft. With the inner end wholly floating now and with the outer end partly floating we have what is called today the "three-quarter floating type" construction.

Full Floating.

Freeing the outer ends of the main shafts from their duty of even supporting the wheel in an erect position involves the use of an extra bearing at this

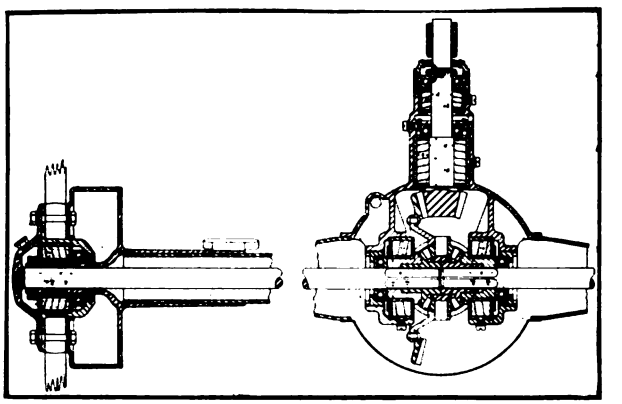

Fig. 4—Three-Quarter Floating, in Which Withdrawal of Shafts Is Permitted.

point. This construction is illustrated in Fig. 5. Here the two bearings are sufficient to carry the wheel in its proper position under any and all conditions. The main shafts now have absolutely nothing to do beside simply transmitting the torsional load or power from the gears at the centre to the wheels at the end of the axle. This is usually accomplished at the wheel by means of a flexible connection in the form of a clutch.

Advantages.

A properly designed and properly built axle of any one of the above types will prove entirely satisfactory to the average user. The parts will all be strong enough and will be assembled with such accuracy as to make repairs, except in the case of accident, almost unnecessary. The two moderate priced cars whose total production added is more than one-fourth the entire quantity of cars built each year have axles of the live type. There are a number of cars selling for $5000 and over whose axles are of the semi-floating type.

Assuming that one is entirely conversant with the construction of his car and is capable of making his own repairs it is of course convenient in the event of difficulty with the differential to be able to withdraw the main shaft without other trouble than simply the removal of the wheel hub caps and differential cover. This feature of removable shafts, however, can be and is applied to axles of all but the live type. Overlooking the fact, this feature is one which is most prominently played upon today in advocating the full floating axle.

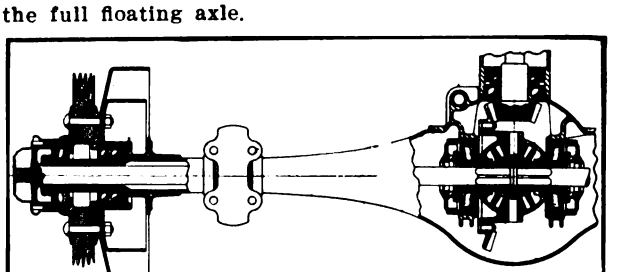

Fig. 5—Full Floating Design: The Outer and Inner Ends of Shafts Are Free from Other Than Driving Load, the Wheels Being Supported by Two Bearings.

Digitized by Google

So far as the bearing equipment is concerned it must be remembered that no special make or type of bearing is necessarily adapted to any particular axle type. Each maker claims certain merits for his product whether it be a roller bearing or a ball. If the product stands up to the claim his bearing can be practically applied to any axle by proper arrangement of the surrounding parts.

The full floating axle, especially if in addition to the loose clutch at the outer end, it has added a universal joint at the inner end, is necessarily somewhat noisy. These features, therefore, will have to be done away with as a part of floating axle construction if the present tendency toward reduction of noise is to continue.

STUDEBAKER COMPANY FOR CANADA.

The organization of the Studebaker Corporation of Canada, Ltd., the Canadian representative of the Studebaker Corporation, has been completed, and Frank E. Fisher appointed as manager. He is a Canadian, and well acquainted with the people and geography of the country, and has had considerable experience with the Studebaker companies, so that he is particularly well fitted for the position. He has been placed in entire charge of the Canadian business, which centres at the plant at Walkerville, Ont.

SPOKE TIMBER SHORTAGE?

That the floods which have caused so much loss this spring in the South will result in a shortage of timber for automobile wheels is the opinion of a number of the wheel manufacturers, who obtain much of their hickory from the affected territory. Drury L. Porter, of the Auto Wheel Company, Lansing, Mich., has stated that at least a temporary shortage is to be expected, and that the manufacturers are not taking any chances, but are placing orders early. It is stated that all the second growth hickory, from which the best wheels are made, comes from Arkansas, Tennessee, Kentucky, and Louisiana, in the low ground which has been under water for some time. No shipments are to be had from this territory, and it will probably be a month or more before any may be expected.

MOVING PICTURE DRIVING TEST.

One of the most interesting and popular courses at Harvard University is that in psychology, conducted by Hugo Munsterberg. A recent piece of apparatus which was installed in the laboratory is designed to test the reaction of chauffeurs and see if they are fit to drive cars. In the test, the subject is placed in an automobile, in running order, but jacked up. In front of this is a screen upon which is thrown moving pictures of road conditions, according to which the chauffeur is to govern his car. He is told to consider that he is out on the road, and to act just as he would if any of the things shown on the screen should happen. The pictures are shown in a darkened room, and the illusion of being on the road is quite good, so that it is an excellent test. Various emergencies occur on the wall, pedestrians and other vehicles suddenly appearing in the way, and by the actions of the chauffeur his ability is judged. It has been found that all men fall into one of three classes. The first perform the necessary operations without delay or confusion, the second appear slightly disturbed, while the third lose control entirely and perform the reverse of the proper operations.

OLD OREGON TRAILS UNITED.

A movement is on foot, fostered by the Portland Automobile Club, Portland, Ore., to establish a new route to be called the Central Oregon highway. This will be a union of the Old Oregon trail, the California trail, the Dalles Military road, and the Willamette Valley and Cascade Mt. Military road, and will lead from Dalles down through central and eastern Oregon across southern Idaho through Boise to Salt Lake City, where it will connect with the main transcontinental route which has been mapped out as the course of the run to San Francisco in 1915. The idea of the new highway, aside from providing a route to the Middle West, is to divert automobile parties going westward, and lead them to Portland, whence they can take the Pacific highway direct to San Francisco.

INDIANAPOLIS TENT SHOW A SUCCESS.

The automobile show which the members of the Indianapolis Automobile Trade Association held this spring in a tent was a decided success. At a recent meeting of the association, the members were given checks amounting to 50 per cent. of the sums they paid for space, and it was reported that $1000 had been laid aside to go toward the erection of a coliseum where displays can be held in the future. No plans have as yet been made for the erection of the building, but it is stated that the members are still endeavoring to interest public or private enterprise.

DETROIT CLUBMEN SPECIAL OFFICERS.

Three members of the Wolverine Automobile Club, Detroit, have been sworn in as special policemen and provided with badges and full authority to arrest speeding motorists. They are Harry Porter, the club president and chairman of the runs and tours committee, H. H. Robinson, and W. G. Bryant, the club's attorney. They will act without salary, in the interests of motoring in the automobile centre. This action is the result of the campaign which the club has been waging against speeders, with the co-operation of the police department, and is expected to assist the organization considerably, as it places some power in the hands of three of its members who have been especially energetic in the anti-speeding crusade.

ADDITIONAL LEGISLATION IS NOT NEEDED.

IT IS more or less well known that the police and court officials of New York City have been taking up the matter of automobile speed regulation in that municipality with a view to securing a new ordinance or law, which is expected to solve the problem. At least one conference has been held between the city magistrates and leading motorists, but with somewhat indefinite results. The following communication sets forth the situation in a logical manner, from the viewpoint of the Automobile Dealers' Association, Inc., an organization which has done much for motor car owners in local and state legislative matters.

Editor, Automobile Journal:

Just at this time the automobilists are being severely criticised and a demand is being made for new regulations governing their control in New York City. Great stress is laid upon the increased number of accidents, the critics contending that they are caused by excessive speed. In nearly all cases it will be found that where accidents occur the automobiles are driven at a reasonable speed and are absolutely under control of the driver, and in nearly every case it will be found that the accident was due to contributory negligence on the part of the injured person.

A special committee has been appointed by the aldermen of New York City for the purpose of drawing up a new ordinance regulating automobile speed with the idea of reducing the number of fatalities and accidents. This is not the way to handle the situation; the laws which we have at the present time are adequate if enforced, and the answer to the critics is the enforcement of the law rather than the drawing of new ones. The making of a new speed ordinance will not stop the reckless driver. If he breaks the law limiting speed to 30 miles an hour, he will do so if the speed limit is reduced to 20 miles an hour. The proper thing to do is to arrest and punish such drivers, not to make new laws that will be a hardship on all motorists.

The magistrates of New York City have decided that the old city ordinance is effective. This ordinance provides for a speed of eight miles an hour in congested districts and 15 miles an hour where the houses are more than 100 feet apart. This is a ridiculous ordinance and is broken by every automobile that runs upon the streets. This law should be revoked at once; the Automobile Dealers' Association believes that if the Callan law were in force in this city and the same was strictly enforced, it would be a means of reducing the number of accidents.

Very few people connected with the enforcement of the automobile laws understand the Callan law. This law provides among other things that "every automobile shall be equipped with brakes in good working order and sufficient to control such vehicle at all times when the same is in use, and a suitable and adequate bell, horn or other device for signalling." It further provides "that upon approaching a pedestrian who is upon the travelled part of any highway and not upon a sidewalk, and upon approaching an intersecting highway or a curve or a corner in a highway where the operator's view is obstructed, every person operating a motor vehicle shall slow down and give timely signal with his bell, horn or other device for signalling." Any person found guilty of a violation of these two sections shall be punished by a fine not to exceed $25.

The Callan law in regard to speed specifies that every person operating a motor vehicle on the public highway shall drive the same in a careful and prudent manner and at a rate of speed so as not to endanger the property of another or the life or limb of any person; provided, that a rate of speed in excess of 30 miles an hour for a distance of one-fourth of a mile shall be presumptive evidence of driving at a rate of speed which is not careful and prudent. The question of speed is well taken care of in this section as is reckless driving and if this law were enforced, and there is no doubt that this could be done as well as the enforcement of the present speed ordinance, it would do away with reckless and careless driving.

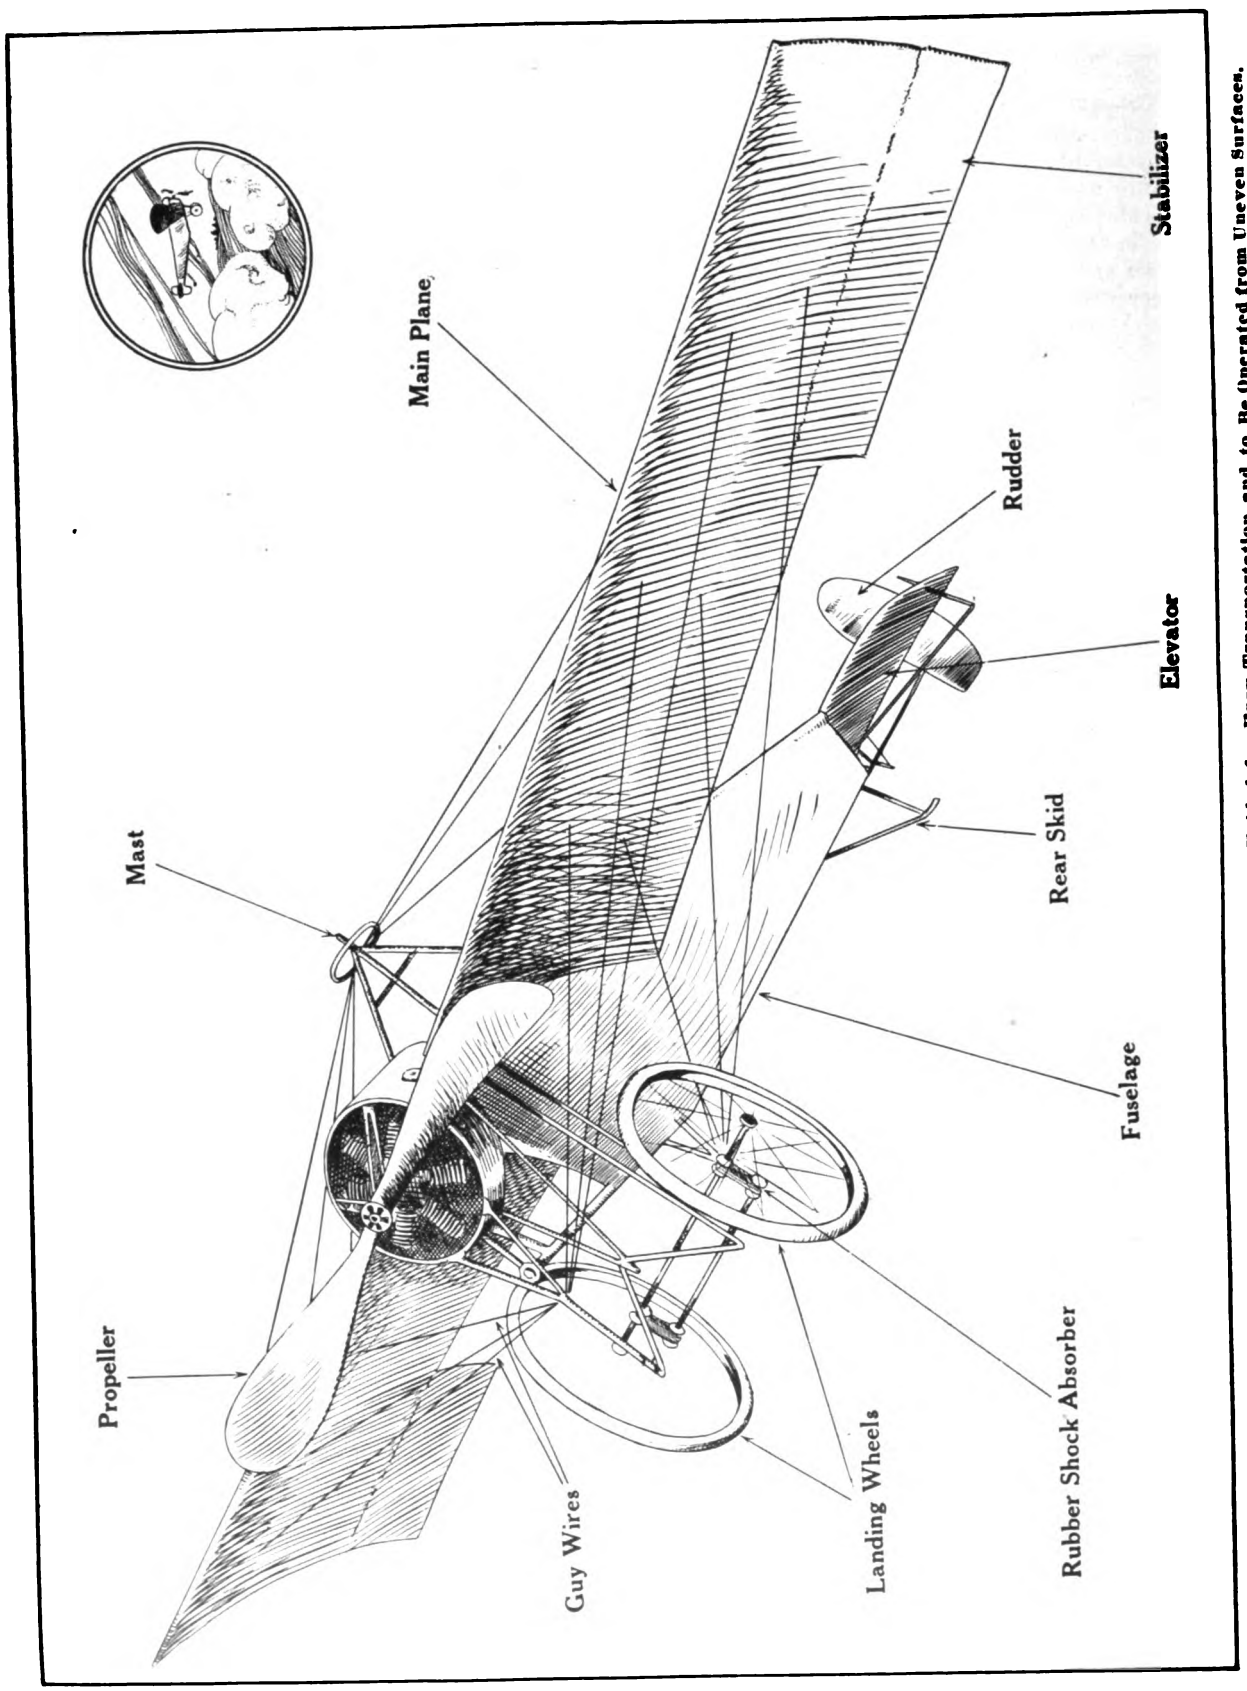
At the present time the contention is, that the magistrates, under the old ordinances can only fine a speeding motorist $10, under the Callan law, a reckless driver can be fined $100, and upon the certifying of the facts to the secretary of state he may upon the third offense revoke the driver's license for at least six months or for such a period of time as he may desire. A special provision of the Callan law provides for the punishment of a motor driver while driving a car in an intoxicated condition, and punishable by a fine. If convicted the second time upon this charge the driver shall be guilty of a felony punishable by a fine of not more than $500 or by imprisonment for a term not exceeding two years, or by both such fine and imprisonment.

These are only a few of the points taken up in the Callan law and are quoted for the purpose of showing that this law fully provides for the care of the public and if put in operation here and strictly enforced the reckless driver will receive the punishment due him. Under the present ordinance and the way it is enforced there is no control over the motorist who desires to speed. With the proper administration of the law the fatalities in this city would be decreased instead of increased. At present there are 25 motorcycle officers in plain clothes in Greater New York who are detailed to catch offending motorists. We read in the press of the number of drivers arrested and the large amount of fines collected. This does not solve the problem.

We believe that if the commissioner of police would put the motorcycle officers in full uniform the same as they were a few years ago it would be the means of stopping the speeders. A driver running along a good stretch of road is inclined to drive fast for the reason that he does not see any one to prevent it. If a motorcycle officer were in view this driver would immediately slow down and keep well within the speed regulations. Strict enforcement of the law, plenty of officers in uniform to enforce it, a revoking of the present city ordinance and the operating of the Callan law in New York City will without doubt decrease the number of automobile accidents.

A great many people have a mistaken idea that the automobilists are looking for everything for their own selfish interests without due regard to the public. This is an erroneous idea; the Automobile Dealers' Association is doing everything in its power to protect the public, and to require automobiles to be operated in a safe and sane manner. A short time ago an ordinance was presented to the city aldermen against the use of the muffler cut-out. This association immediately went upon record as advocating the passage of this ordinance, realizing it was a nuisance to the public and of no use to the automobile. At the present time it is working on a number of city ordinances all of which have to do with the eliminating of certain features of the automobile to which the public are antagonistic and which it feels are unnecessary.

Yours very truly,



CHARLES A. STEWART,
General Manager, Automobile Dealers' Association.

New York City, May 26.

FOREIGN STUDEBAKER SALES MANAGER.

W. H. Lalley has been appointed foreign sales manager of the Studebaker Corporation, Detroit, after having been in charge of the European sales of the company for the past two years. He has established branches in London and Berlin, and is one of the directors of the Studebaker Corporation of England, Ltd. Besides having had considerable experience with the foreign sales of the Studebaker, he is a technical man, being a graduate of the Massachusetts Institute of Technology. His many friends throughout the industry will be glad to learn of his appointment.

Perspective View of the Vendome Military Monoplane, Designed to Be Folded for Easy Transportation and to Be Operated from Uneven Surfaces.

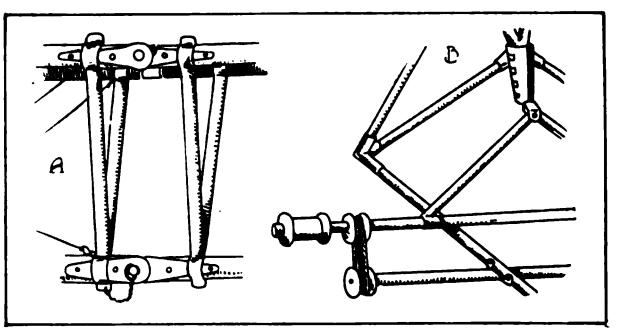
Digitized by Google

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

THE VENDOME MILITARY MONOPLANE.

Back in the early part of 1910, Raoul Vendome of France brought out an exceedingly small monoplane, which was in some respects smaller, lighter and faster than the diminutive Demoiselle of Santos-Dumont. The weight of the complete machine was but 190 pounds, and the inventor frequently demonstrated this particular feature by lifting the entire assembly off the ground upon his back.



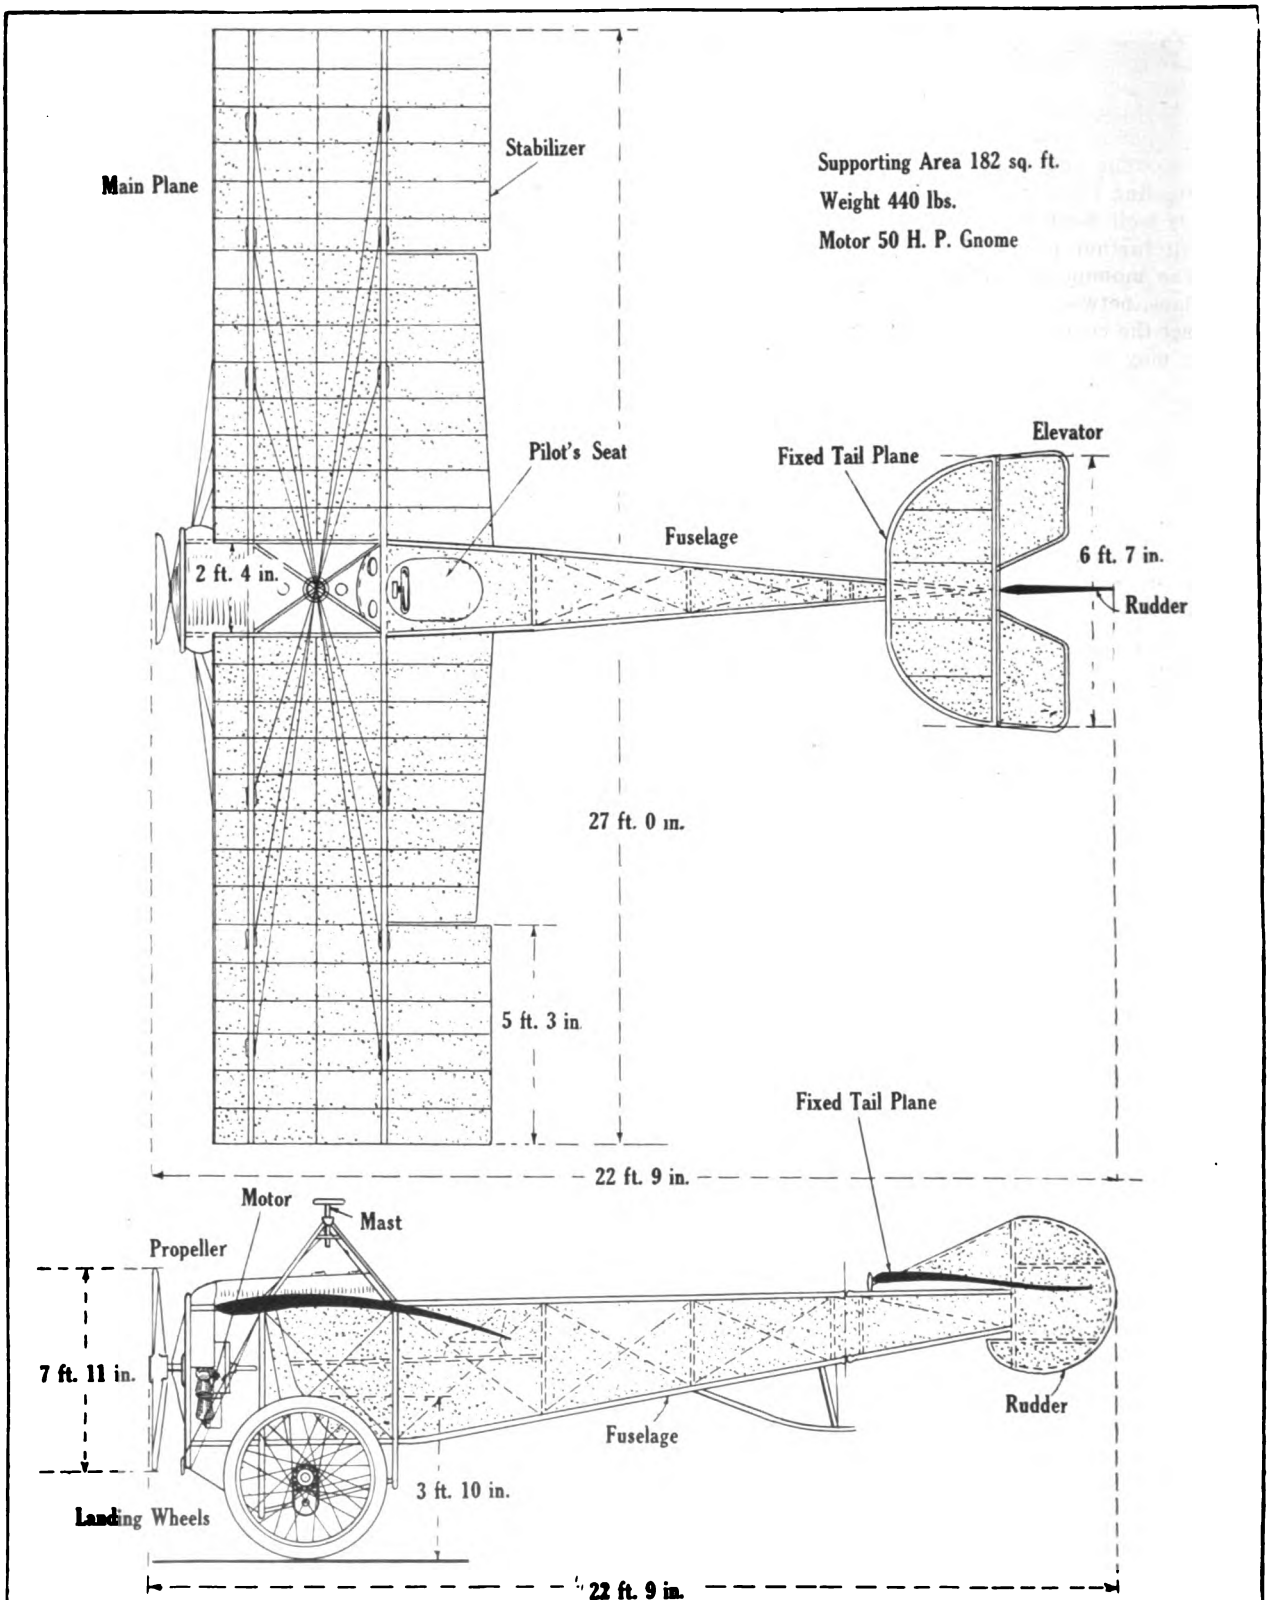
Since that time, Vendome has been experimenting along other lines, but it must be said that each of his creations have demonstrated striking originality, and this is especially true of his latest machine, designed for military service and constructed for the French army. It weighs but 440 pounds, which is very light for a machine of its capacity and still retains the features of simplicity which marked the original design.

First of all, particular attention has been paid to the matter of folding the entire construction for easy transportation in the field. It is claimed that when it is received in a dismounted condition, two men will be able to place it in flying order within four minutes. The work of dismantling is accomplished with equal rapidity.

M. Vendome claims for his machine the following advantages: Rapidity of taking apart and reassembling; folding to take up a space of six feet eight inches by 16 feet six inches by 10 feet; rapidity of getting away and ascending and facility for starting under any condition of earth surface. Each of these has been demonstrated under very severe tests arranged by the government officials before accepting the design.

By examination of the accompanying sketches, the general construction is made apparent. Each section of the main plane is made in two parts, the outer or wing tip, if such it may be termed, being slightly wider than that portion next to the main cellule. The wire bracing is attached in such manner that both the leading and trailing edges appear to have a certain degree of flexibility.

The mast is mounted on four converging legs, which rest upon the top of the main frame just forward of the pilot's seat, and in the centre of this construction is a small hand wheel, turning which slackens off all lower wing bracing. There are then two bolts to loosen and two cotter pins to remove in order to detach all the upper guy wires. A third cotter pin loosens the lower front wires, and the fourth the rear main plane wires. The two sections of the main plane may then be removed immediately and folded as indicated in an accompanying sketch. At first thought it would appear that there might be some difficulty in handling the various wires while this assembly was thus folded, but the inventor claims to have overcome anything of this nature.



Some Construction Details of Vendome Military Monoplane: A, Fuselage Hinge by Which Empennage Is Folded Upward; B, Arrangement of Landing Chassis and Rubber Shock Absorbers.

The fuselage is enclosed thoroughout its entire length, with the exception of that point immediately under the engine mounting. The front of the motor housing also is open to assist in cooling the revolving Gnome. By examination of the side elevation, a joint in the fuselage may be noted just behind the tail skid. This permits the empennage to be folded upward against the rear of the main plane, still further reducing the size of the package for transportation. This fuselage hinge is shown in more detail at A in an accompanying sketch.

It ought to be added in this connection that the en-

Digitized by Google

Plan View and Elevation of Vendrome Military Monoplane, Showing Detailed Dimensions and Principal Features of Design.

Digitized by Google

gine is mounted on two pressed steel bearers and that the pilot is amply protected from the splashing of oil and the rushing currents of air by a distinctive wind and oil shield. Although most military machines are expected to carry two persons, it would appear that Vendome has made no such provision in this instance. The single seat is located well back toward the trailing edge of the main plane, and placed sufficiently well down in the machine so that the operator is still further protected from air currents.

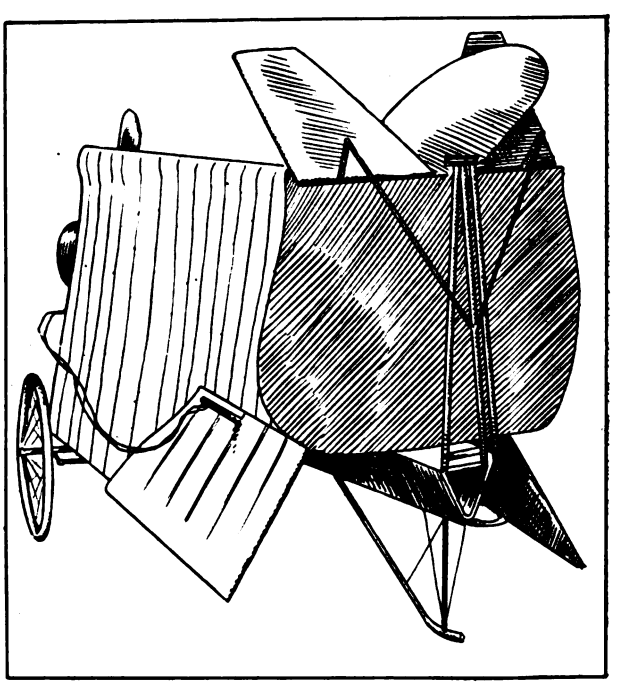
The monoplane tail carries at its rear two elevator flaps, between which is placed the rudder. In this respect the construction does not vary materially from what may be termed standard design. The location of the rear skid is somewhat unique, however, due to the provision for folding, previously mentioned. It may be added that it is so situated as to protect fully the tail formation in landing.

Vendome does not place the same reliance in front skids that has been noted with other constructors. In his opinion their use is far from satisfactory in making landings on uneven ground it being maintained that they dig into the earth and tend to force the machine to capsize.

The landing chassis is another original feature with Vendome. Inasmuch as this machine is designed primarily for the purpose of being operated over the most uneven ground, it is claimed by the inventor that small running wheels are liable to become caught in the irregularities of the soil, suddenly stopping the machine with sufficient force to turn it over. Therefore, he employs wheels of very large diameter—three feet 10 inches.

These are attached to the fuselage in a manner suggesting the so-called Henri Farman design, although the construction of the chassis is materially different because of the size of the wheels. Rubber shock absorbers take up all jars and jolts, to which the machine necessarily is subjected when making landing as contemplated.

The entire assembly has a neat and finished appearance, extreme care having been taken to bring about a machine which shall be capable of withstanding severe usage. The workmanship and material are of the very best, and particular attention has been paid to the matter of strength and durability. The accompanying sketches show how well the details have been carried out in every particular.



Apparently, the machine will find its greatest usefulness in reconnoitring work, in which the services of but one man will be required. The ease and rapidity with which it may be made ready for flight, and the corresponding facility with which it may be returned to its folded position for transportation, are factors that are expected to make their appeal with army officials.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

AUTO TO POST DESERT.

The Great American desert, in southern California, is to be charted and its trails and pure springs posted, by the aid of an automobile, a Flanders, made by the Studebaker Corporation, Detroit. Lou Weston Beck, a former prospector, who is familiar with the desert, is to do the work, accompanied only by his dog. It is estimated that the desert exacts annually a toll of 25 lives, and it is with the idea of saving some of those who penetrate the waste that this work is to be done. The cost is to be borne by wealthy citizens of Pasadena, who have purchased the car, and by Mr. Beck, who for the past winter has been painting the signs.

The itinerary of the car calls for a total of 600 miles, and the route touches the railroad only once for gasoline and oil. The car is to go as far as the famous Death Valley on this trip, and Mr. Beck hopes to continue the work until the entire desert is charted and posted. He is trying to enlist the services of the federal government, which, by installing large signs and signals on the tops of buttes could render what might be called a desert light house service. No automobile has as yet successfully negotiated the desert, the last attempt being two years ago, when a party of seven in a high powered car perished through drinking from a poisoned spring.

Vendome Military Monoplane Folded Ready for Transportation in the Field.

L. P. Halladay, who formerly made a car bearing his name in Streator, Ill., has returned to that town and secured a plant on Monroe street, where he will make parts and accessories.

The entire world mourns the death of Wilbur Wright, the result of typhoid fever, at Dayton, O., May 30. So absolutely have the two Wright brothers, Wilbur and Orville, sunk their identity in connection with the development of the aeroplane, that it is impossible to state which of the two thought out the first detail, constructed the first successful heavier-than-air flying machine, or made the first flight. Wilbur was the elder. There is an older brother, Lorin, who materially aided in perfecting all of the Wright machines, although he appears to have been in no sense an inventor or an aviator. There also is a sister, Catherine; another brother, Reuschlin, and the father, Bishop Milton Wright of the Methodist church, all of whom survive Wilbur.

Wilbur Wright was born near Millville, Ind., April 16, 1867. Orville was born in Dayton, O., four years later. Their education was limited to that obtained in the public schols of Dayton and ended with the high school. Their father was at that time an itinerant Methodist preacher, but later became editor of a church periodical. The two brothers early turned their attention to printing, but the mechanical mind of their mother is largely held to have been responsible for the future of the aeroplane.

It was as the Wright brothers that Wilbur and Orville gave up the printing business to open a bicycle repair shop in Dayton, just previous to 1896. During that year Orville had the typhoid fever, and when he was recovering Wilbur began reading to him accounts of Prof. Langley's steam driven machine, which flew without an operator; Octave Chanute's glider, and A. M. Herring's experiments. Orville became so enthused that the physician and nurse were compelled to forbid Wilbur's visits. When the former recovered, the two constructed a glider, and while the neighbors laughed at them and the rest of the world refused to believe what it heard concerning them, the Wright biplane came into being.

In 1900 the experiments were continued at Kitty Hawk, N. C., but the world still refused to believe. In 1903, they first installed an engine, a 12 horsepower unit, in their glider, and one of the brothers, which it has never been stated, left the earth's surface. The world had laughed so long that the brothers determined to keep their secret, until they were certain of their reward. The first corner was turned in 1905, and the wing warping device, upon which has hinged the patent litigation of two continents, is supposed to have been brought out about that time.

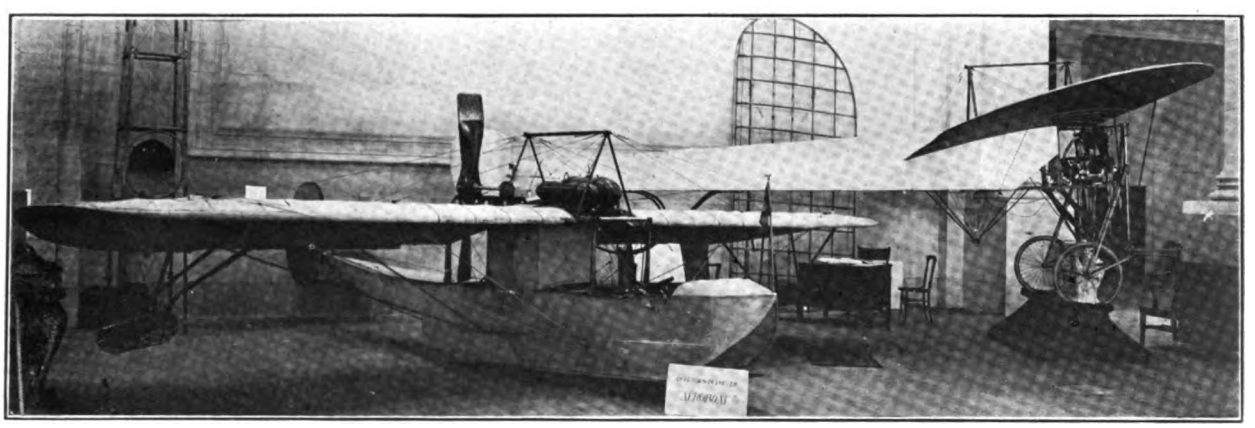
How the Wright biplane has changed in appearance, and what it has done for the science of aviation are well known by students of that science. The world no longer laughs. It hastens to give credit to the Wright brothers for solving one of the greatest mysteries of all ages. It mourns the death of Wilbur Wright, largely because it believes that his work was far from being completed.

"Bullet" Monoplane of Novel Appearance, Designed by J. Edson Gallaudet and Constructed by the Gallaudet Engineering Company, Norwich, Conn.

Digitized by Google

The Gallaudet monoplane, otherwise known as the "Bullet," because its outlines suggested that name to the designer, J. Edson Gallaudet, is made by the Gallaudet Engineering Company of Norwich, Conn. It made its first public appearance in the recent international exhibition at the New Grand Central Palace, New York City. It previously had been given its trials at Norwich, but neither the inventor nor the constructor was prepared to make a statement concerning it.

The accompanying illustration was taken at Garden City, Long Island, and gives an excellent idea of its construction. Practically the whole machine is built of steel, the only wood employed being found in the propeller and a few small parts around the operator's seat. Its chief characteristic lies in the fact that the entire assembly, except for the lower portion of the chassis wheels, is completely enclosed. It will be noted that the motor is covered with a perforated shield, the whole idea being to provide the least possible wind resistance, and at the same time to secure the utmost cooling effect from the rushing currents.



Lateral balance is secured by warping, this being accomplished by depressing pedals, and the wing construction is such as to bring about automatic stability in a measure. The tail and rudder are operated by a single hand lever. The angle of both wings may be adjusted during flight, so that a wide range of speed may be obtained. Attention may also be drawn to the propeller at the rear, this being a three-bladed unit, and the position is claimed to offer many advantages, among which may be mentioned the elimination of danger from rough landing and the location of the chassis with a low centre of gravity. The wheels are fitted with regular automobile clincher tires, which the company holds may be replaced at any garage. The Gnome engine is fitted as standard equipment, although any other make may be had at the purchaser's option.

The third woman to secure a pilot's license in this country is Mrs. Julia Clark of Denver, and it may be added that she is the first woman pilot to fly an American made machine. Mrs. Clark took her course of instruction at the Curtiss school in San Diego, Cal., and drives a Curtiss biplane.

The Loening aeroboat, shown in an accompanying illustration, is designed by Grover C. Loening and constructed by the Queen Aeroplane Company of New York City. It was given its first trials at Bayonne, N. J., in April, and has proved itself a practical air and water craft.

As will be noted, the machine is sustained on the surface of the water by the hull, resembling that of a motor boat, about 25 feet long. In this the pilot sits well forward, a windshield and the control mechanism being the only portions of the craft in front of him. Behind him is the revolving Gnome motor of 50 horsepower, and above a single pair of wings with spread of 28 feet. A special type of rudder is located at the extreme rear.

The other machine seen in the illustration is a

Grover C. Loening's Aeroboat and Queen Monoplane, the Latter of Bleriot Design, Exhibited by Queen Aeroplane Company at Recent New York Show.

Queen monoplane, a design which was patterned closely after one of the Bleriot models. This machine has done excellent work in the hands of several aviators, its most notable performances being in connection with the Chicago meet of last summer.

While the matter of selecting the three aviators who will represent America in the fourth race for the Gordon-Bennett trophy in Chicago in September, rests with the Aero Club of America, it is of interest to note that several applicants are ready to be chosen. The proposals for constructing a machine for this purpose were in the hands of the committee June 1, but no decision is expected to be announced in the immediate future.

Among those who seek to defend the cup, now held by Charles Terres Weymann, who may defend it if he choose are included representatives of Curtiss Aeroplane Company, Hammondsport, N. Y., maker of the Curtiss biplane; Burgess Co. & Curtis, Marble-

Digitized by Google

head, Mass., maker of the Burgess-Curtis monoplane and other machines; Rex Monoplane Company, Washington, D. C., Rex monoplane; Gallaudet Engineering Company, Norwich, Conn., Gallaudet monoplane, and Washington Aeroplane Company, Washington, D. C., Columbia biplane. Others are expected to make known their desires in this respect within the next few weeks.

Lieut.-Col. C. P. Winder of the Ohio National Guard, has the honor of being the first militia officer to have his name placed on the army register as a military aviator in reserve. He received his license at College Park, Md., May 24.

During the progress of the recent show in New York City, the newly organized Aeronautical Manufacturers' Association held its first banquet, at which 28 members were present. Undoubtedly, this was destined to be an epoch making feature in the history of American aviation. Few people are aware that the business of constructing aeroplanes and aeroplane materials has reached a point where it is either desirable or possible to form an association of this nature.

F. A. Seiberling, Vice President, Aeronautic Manufacturers' Association.

Probably the chief moving spirit in the organization of this body was F. A. Seiberling, president of the Goodyear Tire & Rubber Company, Akron, O., and first vice president of the association. In fact, it may be stated that no one concern, expect those directly connected with the production of aeroplanes, has done more to promote the industry in America than that represented by Mr. Seiberling.

Some years ago, when the flying machine was in the process of its early development, and before the manufacturers on this side of the water were ready to conduct the business as it is handled today, the Goodyear company decided it would be necessary, in order to encourage the industry, to undertake at once the making of aeroplane fabric.

It was found that the best fabric made was a rubber treated material produced abroad, and after importing some of this, the Goodyear company at last secured machines that could produce it properly. Since that time several improvements have been made, until the Goodyear fabric is now considered far superior to the imported product, by such well known constructors as the Wright Company, Curtiss Aeroplane Company, Burgess Co. & Curtis and several others.

In this connection it is of interest to note that the United States Army is studying the efficiency of an aviator's life vest, manufactured by this company and invented by John H. Maus, manager of the New York branch, who is also treasurer of the association. The aeronautical department at Akron is in charge of E. R. Preston, while E. B. Sigerson represents the company on the road as aeronautical salesman. It must follow that the construction of aeroplanes has reached an important stage when a concern of the standing enjoyed by the Goodyear Tire & Rubber Company, is able to employ a travelling salesman who devotes his time and attention to calling upon this trade.

Flying a Deperdussin monoplane, Albert Crombez, a Belgian aviator, flew from Nieuport-les-Baines, near Ostend, to Calais, thence to Dover and back to Belgium, May 21, covering a distance of 150 miles in 14:00. This is the first time a double-cross channel trip has been made without stopping.

Paul Peck drove a Columbia biplane, made by the Washington Aeroplane Company and fitted with one of Emile Berliner's Gyro revolving motors, 4:23:15, at Nassau Boulevard, Long Island, May 24, creating a new American record for duration. The previous mark of 4:16:35 was held by Howard Gill in a Wright biplane, and was made at Kinloch, Mo., in October.

The Aero Club of Belgique (Belgium) has named Charles Frank van dan Merrsche, known to the world of aviation as Frank Morok, an inventor and constructor, as its representative in the fourth race for the International cup at Chicago in September. He will fly a Morok biplane, in the building of which F. F. Shneider of Germany is associated with him. Van dan Merrsche is a resident of New York City, and has been for some time. He secured his pilot's license at Nassau Boulevard, Long Island, last month, under the observation of officials from the Aero Club of America.

The Aero Club of Switzerland is planning an hydraeroplane meet at Ouchy-Lausanne during the first two weeks in September. Invitations have been sent to all the aero clubs represented in the Federation Aeronautique Internationale asking that all manufacturers of this type of air craft enter the contest.

Germany has joined other foreign countries in securing an American hydraeroplane, having bought a Curtiss, from the Curtiss Aeroplane Company, Hammondsport, N. Y. The purchase was made through

Herr Kober, directing engineer of the Zeppelin Company, Friedrichshafen, constructor of dirigibles for the German army, and it is understood that it will be placed at the disposal of the German navy. Charles C. Witmer will deliver the machine at the Zeppelin works on the shores of Lake Constance.

Basing his design upon a vision described in the first chapter of Ezekiel, B. Cannon, an inventor who claims Texas as his home state, has organized the Security Air Craft Company and is building what he calls a biblioplane on the Cicero flying field of the Aero Club of Illinois at Chicago. The quotation from the Bible follows:

> And their appearance and their work was, as it were a wheel in the middle of a wheel.
>
> And when the living creatures went, the wheels went by them. And when the living creatures were lifted up from the earth, the wheels were lifted up.
>
> And under the firmament were their wings straight, the one toward the other; every one had two, which covered on this side, and every one had two which covered on that side, their bodies.
>
> Their wings were joined one to another; they turned not when they went; they went every one straight forward.

Cannon has applied this prophecy literally, it would appear, since he has built a wheel within a wheel, which has four propellers, each of which may be feathered on the upward sweep of the wheel, thereby eliminating resistance, and opened on the downward sweep to exert the greatest degree of power. A chain will drive the larger outer wheel and connect the blades. Four of these wheels, two on either side, are expected to drive the biblioplane, which is of the monoplane type.

TO MAKE CRARY STARTER.

The T. C. F. Manufacturing Company, which was recently organized in Detroit to manufacture the Crary starter, has taken offices at 650 Woodward avenue. The Crary starter is of the acetylene gas type and has been adopted as standard equipment on Lion cars.

VACUUM OIL DIVIDEND.

The Vacuum Oil Company, Rochester, N. Y., has issued a statement that a dividend amounting to six per cent. is to be declared shortly, in two installments. The company recently increased its capital to $15,000,000, and it is upon this capitalization that the dividend will be paid. It is probable that in the future the dividend rate will be 12 per cent. annually.

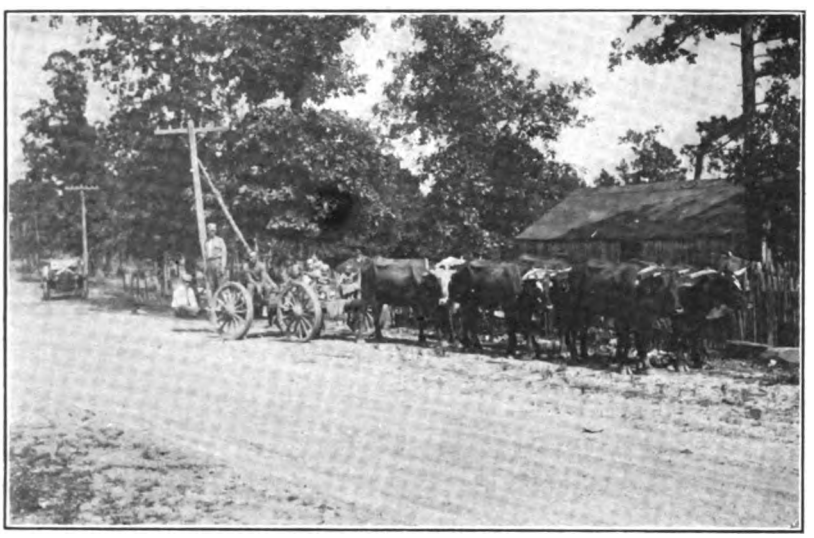
MAINE CLUB WANTS GOOD ROADS.

The Maine Automobile Association has issued a call to the citizens asking for the construction of good roads. The association maintains that much of the wealth of the state is due to the tourists, and that the only reason that more of them, and consequently greater wealth, do not enter the state is due to the poor condition of the roads. The association says, that if the people help it with better ways, it can advertise them through its affiliations and connections in all parts of the country, and bring many millions of money into the state.

BENSON WITH STUDEBAKER.

Ernest R. Benson recently was appointed sales manager of the Studebaker Corporation, Detroit, after having been connected with the Cadillac Motor Car Company in the same capacity for five years, and the move has attracted considerable attention in automobile circles. He is numbered by those who are qualified to know, as one of the pioneers in placing automobile selling on a firm basis, where the prices and service of high grade cars are as well established as in other lines of successful business endeavor.

E. R. Benson, Sales Manager, Studebaker Corporation.



Mr. Benson has earned the name of business builder, having a reputation for creating a solid and permanent volume of sales, and of securing the confidence of the manufacturer, dealer and customer. During his experience he has been a sales organizer, engaged with dealers in managing selling arrangements. His first connection was with the Pope Manufacturing Company, Hartford, Conn., with which concern he was associated for 12 years, as a member of the sales organization. He then joined the sporting goods house of A. G. Spaulding & Bro., working in the sales department for four years. Returning to Hartford, he became secretary of the Hartford Rubber Works Company in charge of the New England sales.

It was from this office that he went to the Cadillac as manager of sales. In this he succeeded in building up the business along well founded principles, creating a permanent and loyal body of dealers. This quality of developing a loyal force of dealers coupled with his ability to sense the future of the markets and lay plans accordingly makes Mr. Benson a valuable acquisition to the Studebaker organization.

ARCADIA AND THE OZARK HILLS.

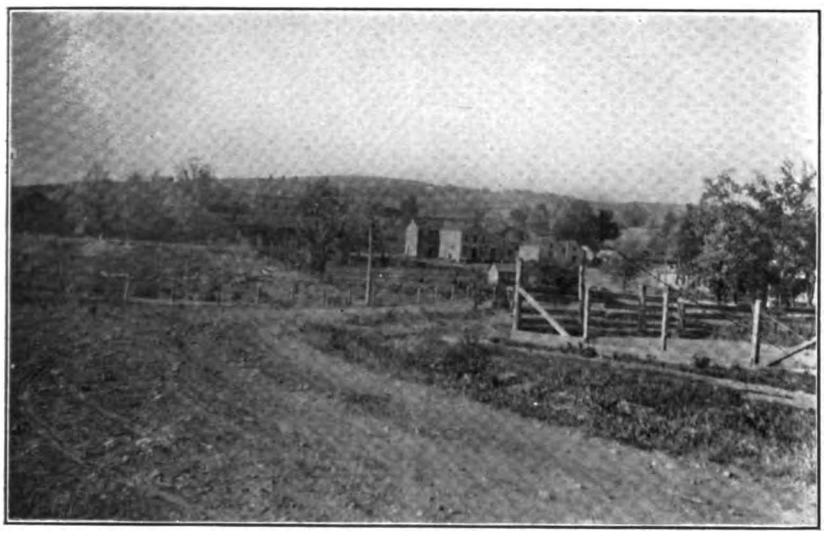
YEARS and years ago, when the first white man visited what is now St. Louis, there was a dim path leading down the Mississippi valley and into the Ozark hills. It was made by the soft tread of many Indians in their search for the new hunting grounds. At least, that is the tradition most generally accepted. Such was the beginning of "the trail that is, nobody knows how old."

The Ancient and Modern Methods of Transportation on the Arcadia Trail.

This old trail enters the Ozark region by way of what has long since been named Arcadia. Those who have visited this section are unanimous in the opinion that Arcadia was rightly named, for a more romantic spot does not exist in the entire United States. The whole Ozark country abounds in romance, albeit its people have been satisfied for the most part to spend their lives among these hills and vales, sometimes looking out beyond the ridges and wondering what was transpiring in that other world, but more often content with their lot and the beauty of their surroundings. Arcadia is the connecting link between what is termed civilization, and the somewhat more primitive life of the hills.

Those who have traced the outline of the Ozarks on the map of Missouri, remember them as a long, low chain of mountains running well up into the state from the Arkansas border line. In reality they are a series of table lands, dotted here and there with more or less pretentious peaks, and separated by fertile valleys. When the first dim path from St. Louis to Arcadia gave place to the trail, it was marked by the wheels of the pioneers' wagons, who came from the East seeking farm lands. And if the trail is, nobody knows how old, many of the Ozark people originally came from, nobody knows where.

Next the trail became a rough, uneven road, over which rolled the heavily loaded mineral wagons, drawn by slowly moving oxen, for the Ozark hills are rich in mineral wealth. There was a time when the iron mines of this region were regarded as possessing the best ore that could be found. The lead mines still are the wonder of the age.



Soon after the opening of the War of the Rebellion, this old trail was beaten down by the tramp of an army's marching feet. Students of history may have lost sight of the importance these old hills played in the conflict, but those who take the time to visit the region are surprised to find the evidences still remaining, which testify to the splendid campaign waged therein, terminating only with the end of the struggle between the North and the South.

During the peaceful period which followed the close of the war, the trail remained for years, the same old, rough, uneven road, winding here and there among the hills and through green valleys, over which in the dusk of the evening, the cattle were driven to their shelters by the rural youth and maiden to the tune of the "Houn' Dawg" song.

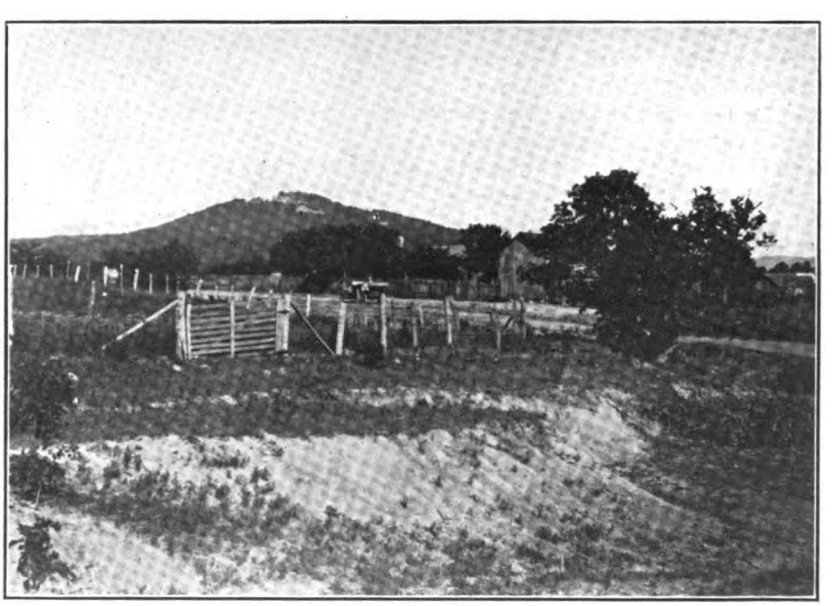
The Famous Chalk Hill in St. Francois County Between Bonne Terre and Flat River.

Digitized by Google

The Deserted Village of Iron Mountain with the Mountain Itself in the Distance.

A few years ago, the trail that is, nobody knows how old, first showed signs of the most modern of passenger carrying vehicles—the automobile. There was something about the romantic hills and the still more romantic trail, which attracted the motorist, ever busy seeking new fields of exploration, far from the hustling commercialism of the cities. And shortly after the first car went over the road, a movement was started looking toward the construction of a permanent highway following the original foot path.

Money was raised to carry out the project, and the work was started immediately. The transformation is now complete. The other day, a modern macadam highway, capable of withstanding the heaviest traffic, leading practically all of the way from St. Louis to Arcadia, and entirely replacing the old Indian trail, was dedicated by the State of Missouri with appropriate ceremonies in every town through which it passes.



Henceforth, the motorists of the country will be able to visit what is said by many to be one of the most picturesque spots in the United States, with every facility in the matter of good roads. The ancient landmarks will be found to have been unchanged, except as the unrelenting hand of time has written the passing of the years.

From St. Louis, the road leads over the well known route through St. Louis and Jefferson counties to De Soto, from which point the romantic portion of the trip may be said to begin. Here the way turns toward the southeast and Bonne Terre. It is somewhat hilly, but over $16,000 was expended for the purpose of placing it in first class condition, and the entrance to Bonne Terre is over a splendid new bridge. While the tourist climbs the easy grades, glimpses of the Ozark hills in the distance continually remind him of the Arcadia which he seeks.

Soon after leaving Bonne Terre, the way leads past the famous old chalk hill with its curious formation. It is but one of the wonders of the Ozark region. Further to the south are numerous caves and caverns in which the venturesome visitor may exercise his imagination as best suits his fancy. But those are beyond Arcadia, and may not be reached as yet by automobile. This old trail leads to a sufficient number of natural curnosities to whet the appetite for further adventure, if time and inclination will permit.

Flat River is in the heart of what has been termed the largest lead mining district in the world. The mines themselves are worth visiting and the owners and managers are always glad to show guests the entire process of extracting the ore and preparing it for market.

Farmington is a city of substantial size, noted principally as a seat of learning. Here are located the Farmington Baptist College, Carvelton Institute, and the Elwood Seminary for Girls. It may almost be said that Farmington offers a strange anomaly, because of its close proximity to the Ozarks, where the people are at least popularly supposed to regard an education as wholly unnecessary for the proper enjoy-

Pilot Knob and Shepherd Mountain, Where Gen. Price's Confederate Army Was Located.

Digitized by Google

One of the Springs of Crystal Clear Water Frequently Found by the Roadside.

ment of life. However, it may be stated that this condition has been changed slightly during the past few years, and the younger generation is seeking opportunity to improve its mental as well as physical well being. Perhaps the automobile has done its full share in bringing this about.

But to return to the old trail: Beyond Farmington is Doe Run, where a stop should be made to inspect the largest individual collection of relics and mineral specimens in existence. It is the property of F. P. Graves, a retired mining man, who takes great delight in exhibiting his curios to motorists and others. This brief respite will prepare the tourist for some of the features which remain before reaching Arcadia.

The road now enters the virgin forest, which covers a greater portion of the Ozark region, excepting of course the rich meadow lands of the valleys and some of the slopes. Handsome foliage abounds on either side and springs of crystal clear water are to be found at frequent intervals near the highway. The rise is somewhat gradual, but the Ozarks are coming nearer with every turn of the wheel, and here and there the woods part sufficiently to provide glimpses of individual mountains which attract and hold the interest.

One of these is Iron mountain, near the old and deserted town of that name. Back in the '50's, when this place was a veritable beehive of industry, the great railroad, the first to enter the Ozark region, was built and had this town as its southern terminus. Some of the richest iron ore in the country was extracted from this mountain, and for a number of years it appeared as if the supply would prove unlimited. Today, the peak, which has been torn open by man in his search for mineral wealth, stands a grim and silent guard, wounded and forlorn, over the old, tumbled down buildings near its base.

Far back in the dim ages, when the oldest of mountains were yet warm with the volcano's breath, nature molded from her storehouse of granite, curious images, such as no imagination could fashion, and hurling them down the smouldering steeps, left them to season and dry. Such granite moldings may be found only at Graniteville. Here the tourists may stop to slip from the back of a great granite elephant into the arms of a huge black sphinx. Here also he will find the modern quarrymen working on the granite blocks for the busy city streets. It is a quaint co-mingling of the fantastic and the real, and a scene long to be remembered.

Old Fort Davidson is next passed. It is located in a meadow at the right of the road, and today there is nothing more than a hole in the ground. It was during the height of the Civil War, when the opposing forces were contending every inch of ground in these Ozark hills, that the little band of Union troops was detailed to hold this position, against what later developed to be practically the whole of Gen. Price's army. For a time they stood their ground despite the

The Road Between Doe Run and Iron Mountain Enters the Virgin Forest.

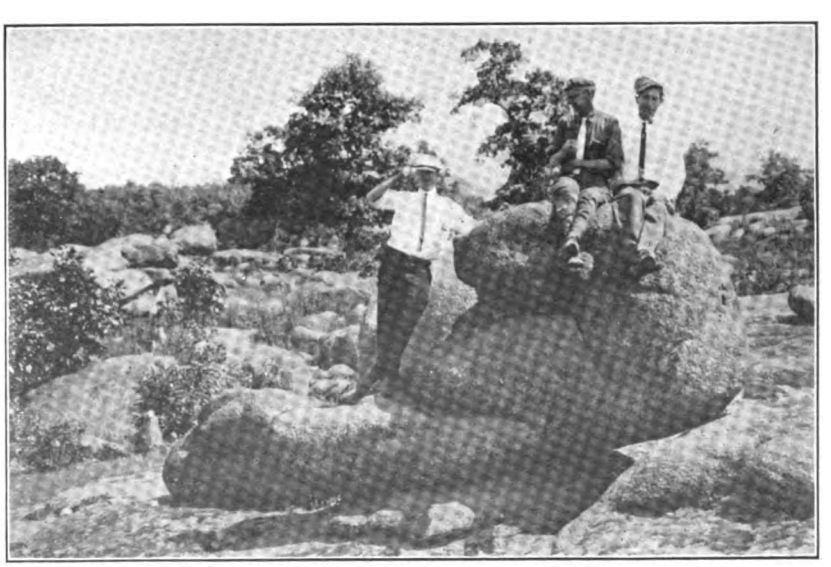
Emerson Park, Ironton, Where U. S. Grant Received His First Commission as Captain.

aggressiveness of these mountain warriors, but finally, in the dead of night, when it was seen that they could hold out no longer, this handful of men blew up the fort and marched into Rolla, nearly 80 miles away.

Pilot Knob, one of the most picturesque spots on the trip thus far, marks the centre of the Confederate position during that conflict. Shepherd mountain, seen in the distance, was where the rebel guns were planted. It was from Pilot Knob that Gen. Price marched upon Fort Davidson to find it desolate and deserted. The battle, one of the bloodiest of the conflict, was fought many miles distant, but the old trail saw its beginning.

Ironton is one of the towns dear to the heart of every American. In the centre is Emerson park, in which a monument marks the spot where U. S. Grant received his first commission as captain in the United States Army. In later years he was to be called to head the Union forces, where the fighting was the fiercest, and afterward to become commander-in-chief as President, but the people of Ironton still cherish the memory of that day on which he took command of his company beneath the trees in the centre of that old town.



The road now begins to wind in and out among the hills and the turns are somewhat more frequent. The beauty of the wooded slopes is appreciated as the car descends into a valley only to begin another ascent almost immediately. At last the beautiful town of Arcadia comes into view in the heart of "the Valley of Flowers", where the blood red "Indian pinks" bloom in June. And here ends the trail that is, nobody knows how old.

Ends? Or begins? It ends, insofar as the macadam automobile road is concerned. Those who desire to explore the Ozarks still further, and there will be many, will find it but the beginning of several pleasant trails which lead to, nobody knows where. There is a particular charm about these simple people of the hills. There was a time when they failed to greet strangers as cordially as might be wished, but that is largely a matter of the past. Nowadays they are too anxious to learn something of that world on the other side of the ridges—that world, about which many of them have heard but concerning which they really know almost nothing.

There is one trail, which leads back to Flat River by way of Fredericktown, Roselle and Ste. Genevieve. The writer took this trip last year. The route lies through the mountains practically all of the way. The conditions, while not at all bad, for the most part, hardly are what might be termed ideal.

It is anticipated that the new road from St. Louis to Arcadia will prove of exceptional interest to motorists from all over the country. There is so much to occupy the attention of the tourist, that although the distance may be covered easily in a day, few will care to make the trip without loitering along the way.

Chief of Police C. B. Bowen of Meriden, Conn., has notified the motorists of that city that the law, respecting the passing of trolley cars which have come to a stop, will be rigidly enforced.

Nature's Handiwork as Shown by the Giant Shoe in the Quarry at Graniteville.

SIMPLE SLOW SPEED OIL PUMP.

An oil pump with a minimum of moving parts, as well as being free from valves, springs or other similar mechanism, has been invented by G. E. Whetman, an English engineer. Among the features claimed of the device is that it will exhaust air and draw up oil from the start without the necessity of priming and that all of its rotating parts practically constitute bearings of large surface, operating in a bath of lubricant.

The operating mechanism is exceedingly simple.

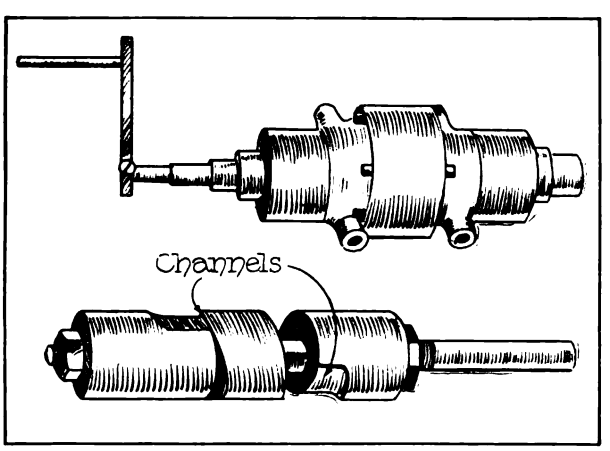

Fig. 1—Whetman Oil Pump Having a Minimum of Working Parts and Operating at Low Speeds.

At Fig. 1 is depicted a complete model and the intake sections will be noted on one side while the outflow is located on the opposite. Inside, the casing merely forms a cylindrical chamber, through which is a shaft driven from the engine. On this shaft, at each end of the chamber, are circular pieces of steel of such diameter as to be an oil floating fit in the pump chamber, but, while they fit in this compartment both on their circumference and at the outer end of the chamber, they are profiled on their inner ends so as practically to constitute side cams. The latter, at each end of the shaft, operate in conjunction with one placed between them in the centre of the chamber.

The outer cams rotate, though the centre member does not revolve but slides along a feather in the pump chamber so as to accommodate itself to the working of the two end cams as they rotate. This combination of sliding and rotating cams is such that in one position the profile of one fits against the other, leaving practically no space, but as the other cam rotates, while the inner cam can only accommodate itself to movement by sliding, it is obvious that the two will cease to fit into each other's profile, and space will occur between the two as soon as one begins to revolve. The position of this sliding cam is, therefore, so arranged that this space begins to open just opposite the intake in the casing, and thus oil is drawn in by suction to fill that space. Further movement finally shuts this space off from the inlet, and the oil filled space is then, by the revolution of the outer cam, transferred around the profile of the sliding cam to the delivery side of the pump. Moreover, the cam combination is so formed that, just as the oil filled space begins to reach a point opposite that of the delivery opening, the profile of the rotary cams again begins to butt up against that of the slider, so that the profiles of the two again tend to fit each other. This has the effect of squeezing the oil out from between the cams, and so force it through the delivery openings.

The internal cam arrangement is also shown, and it will be noted that the divided line between the rotary and sliding cams does not lie absolutely opposite the intake and delivery openings, because space has been allowed between these for the use of a wrench on the union nuts, and therefore channels are cut on the rotary cams to connect the openings with the internal cam spaces.

The device is designed to be operated at slow speeds, the inventor pointing out that the shaft should not exceed 120 revolutions a minute. Tests developed the fact that at extremely low speeds, even at nine revolutions a minute, Vacuum A oil was pumped with excellent results.

WING NUT KINK.

There are several places about the motor car where wing nuts would be desirable, as these members facilitate the removal and replacement of parts. A simple method of converting ordinary nuts into wing members is depicted at Fig. 2 A. It consists of drilling two holes in the nut and driving a staple through the openings, peining over the ends of the staple. The latter should be long enough to pass through the nut as well as to provide means for rotating it.

HOME MADE MICROMETER.

A micrometer is a very useful tool in the garage equipment as by it fine measurements may be made. One may be produced at a very small expense, says Popular Mechanics, and the tool will fill all requirements. The frame is cut from heavy sheet metal and of the shape depicted at Fig. 2 B, the ends being rolled over to form openings .25 and .375 inch outside diameter. A piece of brass tubing, .375 inch outside diameter and two inches long, is fastened securely into the larger opening. On the other end of this tube is brazed a nut tapped with a .25-inch tap, having 40 threads. The sleeve is made of another piece of tubing large enough to go over this nut. Next a bushing is fitted in one end of this sleeve and the other is beveled to about 45 degrees. The bevel is divided on its circumference into 25 parts, numbering every fifth graduation, beginning with zero.

A four-inch rod is threaded about half way to fit the nut and fastened in the other end of the sleeve with a bushing. The anvil is a piece of .25-inch rod fastened on the opposite frame opening, and allowed to project .5 inch inside the frame. Next the sleeve is run down until the screw comes in contact with the anvil and a mark is made on the stationary tube to register with the zero mark on the sleeve and at right angles to it. The sleeve is turned one revolution and another mark is made. This operation is continued until the caliper is opened to its full capacity. One complete turn of the sleeve represents 1-40 inch. One-twenty-fifth of a turn equals 1-25 of 1-40 or 1-1000. Half and quarter-thousandths can be estimated readily.

REMOVING STUBBORN FLYWHEELS.

A flywheel that has been shrunk on and keyed to a shaft presents difficulty in removal and when ordinary methods fail a recourse to heat must be made. At Fig. 2 C is presented a suggestion for removing the most obstinate members. It consists of two pieces of plank of a length slightly greater than that of the crankshaft. These are placed in a perpendicular position, with the flywheel resting on the top ends and the shaft hanging down between the braces.

A little clay is then packed around the end of the shaft as shown in the sketch, and the cavity in the wheel filled with very hot molten lead. If the shaft does not drop out under this treatment, a slight tap with a copper or lead mallet on its end will separate the two pieces.

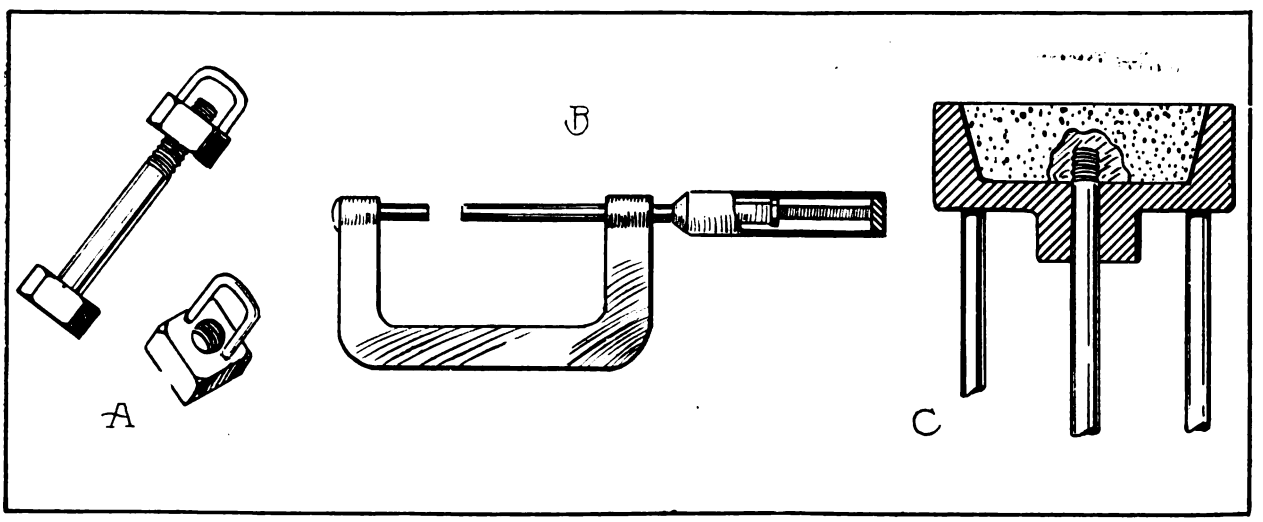

Fig. 2—Suggestions for the Repairman: A, Converting Ordinary Nuts into Wing Members; B, Inexpensive and Easily Made Micrometer; C, Method of Starting Stubborn Flywheel by Application of Molten Lead.

EXHAUST CIRCULATES COOLING WATER.

A new type of water circulating device has just been brought out in England by J. Overs of London, which utilizes the exhaust from the motor to circulate the water through the system. The apparatus is simple, and the idea consists in admitting a part of the exhaust gas through a narrow nozzle into the water pipe. The speed of the gas coming from the nozzle is such that it forces the water along the pipe into the radiator, the device being a sort of injector. The gases pass into the radiator and out by the overflow pipe, so that the water is not heated unduly or any

Digitized by Google

pressure produced in the system. The nozzle is provided with a valve or tap, by which the amount and velocity of gas may be reguated as desired, from a

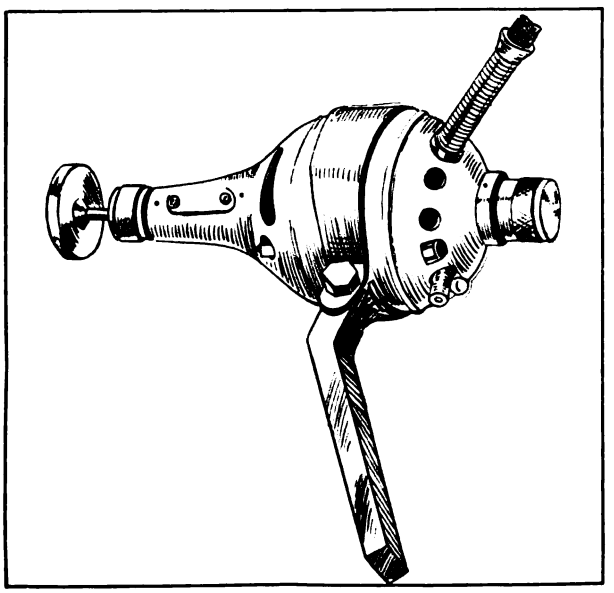

Fig. 3—Hamilton-Beach Portable Electric Grinder, Adaptable to Internal and External Work.

gentle stream to a powerful current. In a test of the device in the open, drawing water from a tank, it was made to throw a jet a considerable distance. The pressure at the nozzle is of course limited only by that in the exhaust manifold at the place from which the gas is taken.

PORTABLE ELECTRIC GRINDER.

Grinding machines are important factors in the equipment of the machine shop, and not only are they economical in the manufacture of machinery and tools, but they produce the same degree of accuracy and excellence when used either on hardened or soft work. While there are many forms of grinders, those of the portable type and designed for attachment to the lathe, shaper or miller are very efficient.

The design depicted at Fig. 3 is the product of the Hamilton-Beach Manufacturing Company, Racine, Wis. It is an exceedingly handy tool for grinding dies, reamers, cutters, etc., and operates equally well on external or internal work. It is claimed by the maker that a .25-inch hole four inches deep may be ground easily and accurately as the device is sturdily constructed and free from vibration. Any kind of wheel may be utilized and felt or oil stones may be employed when a very fine finish is desired.

The grinder is operated by electricity and a direct or alternating current may be employed. The motor is 1-12 horsepower and drives the grinding wheel at 10,000 revolutions a minute. It is air-cooled and proof against heating from overload. The device is very light, weighing as it does, five pounds. The outer casings are constructed of aluminum, highly polished and the dust proof bearings are made of a high speed nickel babbitt. The armature is ground on centres to a mirror finish, assuring extreme accuracy. Adjustable end thrust and main bearings take up all possible wear.

The grinder comes complete with 10 feet of special cord and attachment plug permitting connection to any electric light socket. It is stated by the maker that it may be operated economically, consuming but little current and that hardened tools may be ground accurately. Cutters may be ground without removing them from the milling machine.

SACHS MAGNALAMP.

One of the difficulties experienced by machinists is arranging the lighting equipment so that the work is properly illuminated. Before the electric lamp came into general use gas was utilized, and by means of pivotal joints the flame was brought into the desired position, an operation requiring considerable time.

Even with the ordinary electric lamp there is trouble in locating it so that good results will be obtained. Tie cords, hinged brackets, pedestals, rods, etc., are employed but these have the disadvantage of requiring time for adjustment. A device which eliminates all these troubles, as well as meets with the demand for a light just where and when needed, is the Sachs Magnalamp, brought out by the Sachs Laboratories, Inc., Hartford, Conn.

It is a portable device and similar to the ordinary electric lamp with the exception that it is equipped with a magnetic extension as will be noted by reference to Fig. 5. This projection carries a highly efficient electro-magnet which is combined with the lamp and connection socket, and a switch in a cylindrical structure. It is very compact, being three inches high and 2.5 in diameter. The bulb is protected by an electrically welded guard. The lamp extends either longitudinally from the top end of the cylinder or radially from the side, and its position may be changed

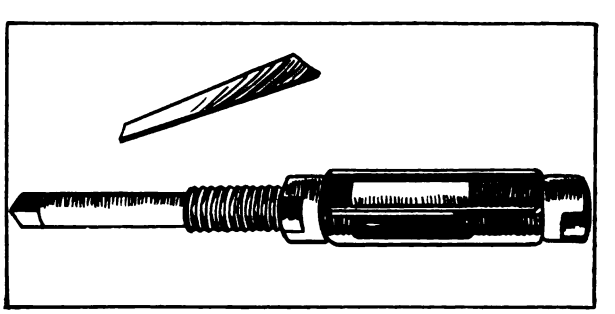

Fig. 4—Critchley Expanding Reamer Fitted with Adjustable Cutter Blades, Permitting Reaming of Odd Sized Holes.

easily and quickly. A connecting plug attached to a flexible cable, may be fitted in either receptacle of the device, and the other end of the cord carries a

Digitized by Google

socket member for attachment to the usual lighting circuit.

A main switch is provided, this being only oper-

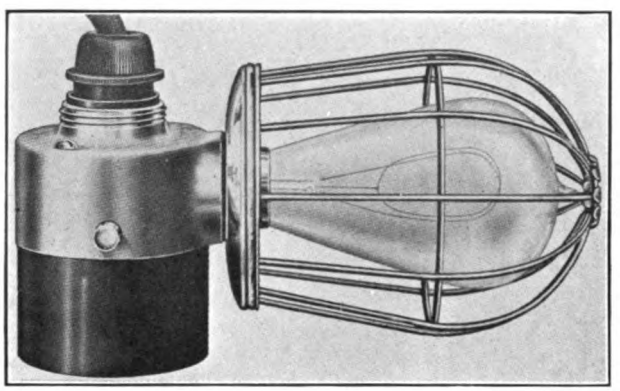

Fig. 5—Magnalamp, an Electrical Device Self-Adhering to Metal by Means of Self-Contained Magnet Operated by Push Button.

ative when the magnet device is not in use. It is operated by turning a knurled disc forming the central pole piece of the magnet, completely closing or opening the circuit with each snap. Pressing a push button on the side of the cylinder releases the grip of the magnet so that the lamp may be placed, removed or changed instantly. Releasing the button brings the magnet into service again. After the light has been turned on by the switch the current continues to flow irrespective of the manipulation of the magnet.

The device will adhere to iron or steel surfaces, smooth, rough or uneven, painted or unpainted, and its grip is unaffected by heat, cold or vibration. One of the many uses to which it may be put is depicted at Fig. 6, which shows it attached to a piece of machinery in operation.

The Magnalamp requires a direct current and is furnished in two standard voltages, 110 and 220 for use with 16 candlepower carbon filament lamps. If utilized with lamps of less candlepower the magnetic grip is said to be less, due to the small amount of current, as the 110-volt member requires about .5 ampere and the 220 about .25 ampere.

Magnalamps are made for servive with higher candlepower and for use on other voltages than those designated. In addition to being of service when operating the lathe, drill press, miller, etc., the Magalamp will prove of value when working on the motor car as it may be attached readily to any metal part of the chassis, facilitating the work. It is not expensive and for a small sum may be augmented by a counter balance device which permits the use of the lamp either with or without the magnetic member.

CRITCHLEY EXPANDING REAMER.

Reamers are exceedingly useful tools in the repair shop as they are used frequently to enlarge holes to size. A complete equipment of these members in order to take care of different work means a large investment. The Critchley patent expanding reamer, manufactured and marketed by Chadwick & Trefethen, Portsmouth, N. H., is designed to do the work of several instruments, inasmuch as the cutters are adjustable, permitting the reaming of odd sized holes, a feature which will be appreciated by the average workman.

The device is shown at Fig. 4 and it will be noted that a screw thread is cut on the body of the tool on either side of a space. The latter is left uncut to insure stability. Five grooves or slots are made on the shank to take the cutters which are beveled at each end and held securely by nuts. When in normal position a certain standard size is obtained. An enlargement is secured by loosening the retaining nuts and moving the cutters in the grooves, increasing the diameter of the cut.

Very fine measurements may be secured easily. The graduations vary by sixteenths, beginning at .46875 inch diameter, although in larger size the reamers vary from .125 to .25 inch. The reamers are not expensive and extra cutters may be secured for a small sum. The device is constructed from a high grade material and all parts are strictly interchangeable.

OPEN MUFFLERS IN NEW HAVEN.

The city of New Haven, Conn., is rigidly enforcing the law against the opening of mufflers, and a number of motorists have been fined for using cut-outs. The chief of police has notified the New Haven Automobile Association to warn its members to observe the

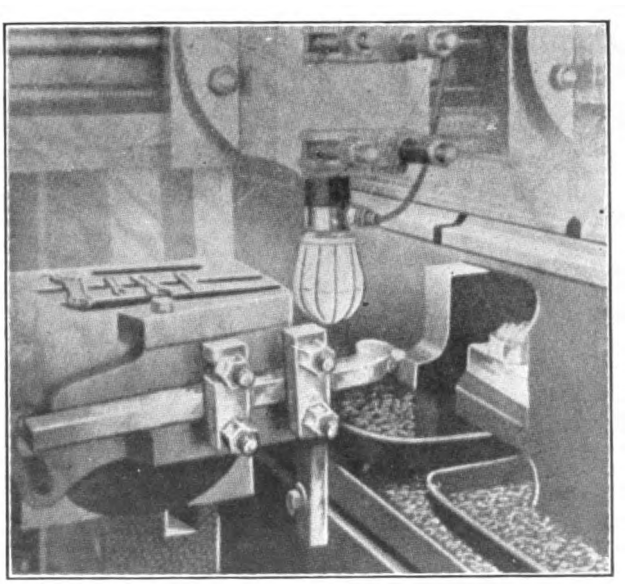

Fig. 6—Showing the Magnalamp Attached to Operating Machinery.

law, as a vigorous campaign is being waged. The law requires that mufflers be not opened within the city limits at any time.

MOTORING NEWS OF NATIONAL IMPORT.

Vermont and New Hampshire Garagemen Unite in Purchasing Supplies and Accessories---New Concerns for Manufacturing Cars and Fittings---Census Figures Interesting---Transcontinental Highway Plans.

Automobile agents and garage owners in Vermont and New Hampshire have organized the Consolidated Automobile Company, incorporated under the laws of Vermont, and with headquarters in St. Johnsbury, Vt. In many respects this is somewhat unique, and its promoters claim it is the first of its kind. H. B. Blossom of the Union Garage & Machine Company, Buick agent in St. Johnsbury, is general manager and treasurer.

The men interested in the new concern operate garages throughout what may be termed the chief touring section of the country. Naturally their business is not so large during the winter months as throughout the period when motorists from all parts of the United States and Canada are visiting the White and Green mountain regions.

After giving the matter considerable thought it was decided that purchases of supplies, accessories and parts could be made to better advantage where these were ordered in substantial quantities. As the business of no one concern is sufficient to warrant extensive buying, the plan calls for the purchase of needed goods by the consolidation, which will sell to the individuals, and it is expected that the dividends at the end of the year will result in larger discounts than would be possible under the old scheme.

FIRST OKLAHOMA FACTORY.

Initial Attempt to Produce Automobiles in This Far Western Commonwealth.

The first automobile factory in the State of Oklahoma is to be built in Oklahoma City by W. E. Nation, who hopes to be producing pleasure and commercial cars within the next three months. A company will be organized with capital of $50,000, and the proposed plant is to have floor space of 12,000 square feet.

Mr. Nation is proprietor of one of the largest retail harness and vehicle companies between Kansas City and the Gulf of Mexico, besides being a member of the Oklahoma City Chamber of Commerce and vice president of the Retail Dealers' Association. For a number of years he and his sons have been spending their summer vacations visiting some of the largest automobile concerns in the country and studying manufacturing methods.

Little is known concerning the new product, but it is understood that it will embody a number of distinctive features, which have been the subject of recent patents granted to Mr. Nation. These are expected to work for economy of maintenance and upkeep, and to prove of decided interest to those who desire a machine adapted for use on the sandy areas of the Far West.

NEW HIGHWAY ASSOCIATION.

Kansas City Convention Takes Important Action Relative to Transcontinental Route.

An important step in the movement to construct a national highway across the continent was taken recently in Kansas City, when the National Old Trails Ocean-to-Ocean Highway Association was formed. This action was the result of a convention at which delegates were present from all the states through which the proposed highway is scheduled to pass, from New York to San Francisco. The route includes almost every city of importance between the two oceans, including Philadelphia, Baltimore, Washington, Wheeling, Columbus, Indianapolis, Terre Haute, St. Louis, Kansas City, Emporia, La Junta, Albuquerque, Phoenix, San Diego and Los Angeles.

The western cities are fully alive to the value of being placed on the route of the transcontinental highway, and many have called the attention of motorists to the good roads leading to them, or to those which they are about to build. The Ogden Good Roads Association reports that a stretch of 100 miles of mountain road, around the northern end of the Great Salt lake is now being improved. The proceeds of a $175,000 bond issue are being used, and the roads are to be marked with direction signs for the entire distance.

The Canon City Business Men's Association, Canon City, Col., has stated that within a year a central route will be in good condition through Pueblo, Canon City, Salida and Montrose, which it advocates as an alternate route for transcontinental motorists. A large force of men is reported at work on a new road between Canon City and Colorado Springs, a magnificent boulevard being under course of construction. According to the secretary of the association, with the expenditure of hundreds of thousands of dollars and the utilization of convict labor, there will be a revelation in the good roads situation in Colorado in the next year or so. A

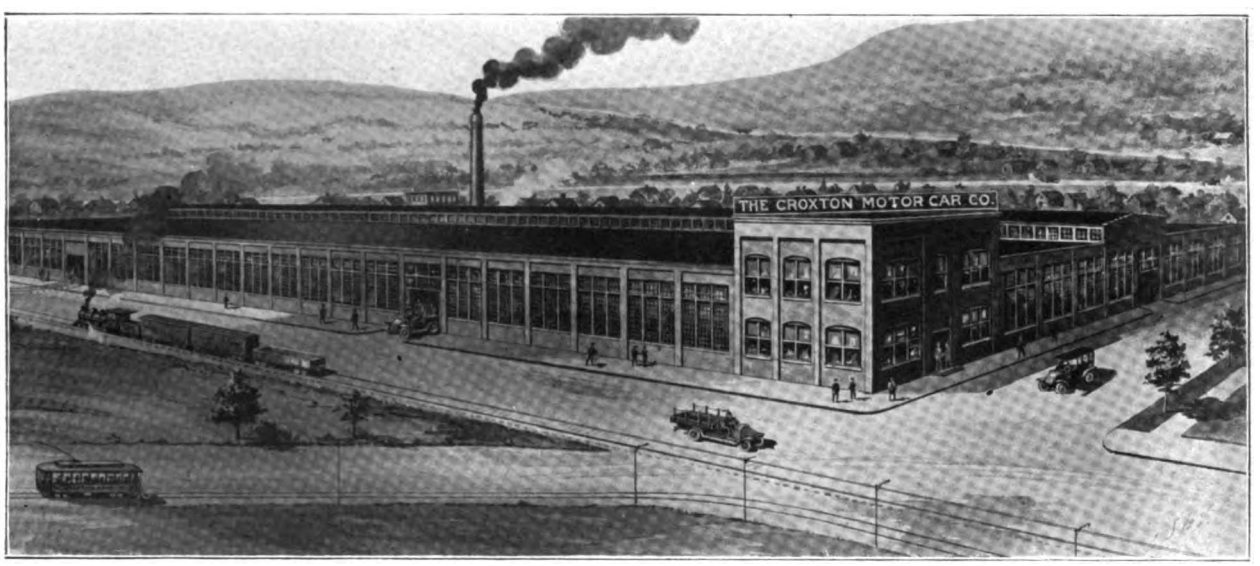
Digitized by Google

network of scenic highways is under course of construction, new roads being laid out and old ones resurveyed and improved.

INTERESTING DECISION.

Massachusetts Supreme Court Interprets Law Concerning Use of Signal Horn.

The Massachusetts supreme court, which has been called upon a number of times to explain the law with reference to the matter of operating automobiles, recently handed down another decision which will be of interest to motorists. The case was that of Lauritz F. Rasmussen against Amos H. Whipple, in which the plaintiff, as administrator of the estate of Albert E. F. Rasmussen, a newsboy, sought to recover for the death of the boy in consequence of injuries alleged to have been inflicted by the defendant's automobile in Mattapan, April, 1907. The full court upholds the verdict of the lower court, giving $2000 to the plaintiff. In passing upon the case the court says:



"Every person operating a motor vehicle on our ways must run it at a rate of speed that is 'reasonable and proper, having regard to traffic and the use of the way and the safety of the public.' There was testimony that the signal horn was sounded, but it was not heard by a number of witnesses to the accident, and under the circumstances the jury could infer that it was not sounded loud enough or sufficiently near the place of the accident to give timely warning. Nor is it contended that even the loud blowing of a horn would give to the motor vehicle any exclusive right of way or relieve the driver from the duty of proceeding at a reasonable rate of speed and of keeping his car in control when approaching a busy thoroughfare."

CROXTON COMPANY EXPANDS.

Well Known Maker of Taxicabs Reorganizes and Locates in Washington, Penn.

The Croxton Motor Company, maker of motor cars, taxicabs, etc., with present factory at 2260-2264 East 69th street, Cleveland, O., has plans prepared and is receiving bids for the construction of an entirely new plant at Washington, Penn., which it expects to occupy Aug. 1. The concern will reorganize, taking out a charter under the laws of Pennsylvania, to be known as the Croxton Motor Car Company, with capital of $300,000. J. P. Stoltz, president and general manager, will retain his positions. The new directors from Washington will be as follows:

John H. Donnan, vice president of the Citizens National Bank; A. M. Linn, president of the First National Bank; A. C. Warne, treasurer of the Washington Trust Company; J. B. Bigger, director of the Real Estate Trust Company; C. S. Caldwell of the A. B. Caldwell Company; G. W. Dudderar, managing secretary of the Washington Board of Trade, and J. I. Brownson, attorney at law and director of the Washington Trust Company. An accompanying illustration presents the proposed new factory.

Proposed Plant to Be Erected by the Croxton Motor Car Company at Washington, Penn.

WISCONSIN CENSUS REPORT.

Automobile Industry Increased from Six to Thirty Establishments in Five Years.

The census figures for Wisconsin show that the industry in that state practically has been developed since 1899. In 1904 there were six establishments,

Digitized by Google

and in 1909 there were 30. The growth of the industry is shown by the following:

	1904		1909	
	No.	Value	No.	Value
Pleasure cars	2378	$1,846,294	5559	$7,050,862
Commercial cars	12	10,400	32	34,700
Totals	2390	$1,856,694	5591	$7,085,562

Other detailed information is included in the following table:

	1904	1909
Number of establishments	6	30
Persons engaged	587	4647
Proprietors	8	18
Salaried employees	59	331
Wage earners	520	4298
Primary horsepower	645	3153
Capital invested	$1,240,000	$8,746,000
Salaries paid	54,000	443,000
Wages paid	300,000	2,733,000
Cost of materials	845,000	5,340,000
Value of products	1,875,000	11,440,000
Value added by manufacture	1,030,000	6,100,000

WANT LENOX FACTORY.

Citizens of Stoughton, Mass., Make Exceptional Bid for Growing Boston Concern.

Recently, H. E. Holbrook of Stoughton, Mass., representing several citizens of that town, called upon the officials of the Lenox Motor Car Company, Boston, maker of the Lenox car, for the purpose of laying a proposition before them, looking toward the location of a plant in Stoughton. That the town appears to be in earnest in seeking the company is gleaned from the fact that the offer includes the gift of sufficient land beside the railroad track, and the erection of a brick factory at a cost of $40,000, the company to pay for the factory at the rate of $5000 a year without interest.

The Lenox car first made its appearance in the market during the Boston show of 1911, and since that time has enjoyed an enviable sale throughout New England and the East. Plans have been under way for an enlarged production during 1912. Evidently the people of Stoughton share the optimistic view of the Lenox officials and are anxious to secure this rapidly growing business for their own.

INDUSTRY IN INDIANA.

Interesting Figures Revealed by Report of the Thirteenth Census of Manufactures.

The report of E. Dana Durand, director of the 13th census, concerning the manufactures for the State of Indiana, sets forth the following with respect to automobiles, including bodies and parts:

"This industry, for which but one establishment was reported in 1899, had increased in 1904 to 11 establishments, with products valued at $1,639,000. In 1909 there were 67 establishments, the value of whose products amounted to $23,764,000, or more than 14 times that reported in 1904. The manufacture of automobile bodies and parts has become so interwoven with other industries that it is not possible to state how fully the statistics show the magnitude of the industry. A number of the foundries and machine shops, and establishments engaged in the manufacture of electrical apparatus and supplies incidentally manufacture automobile accessories and parts, while a number of the establishments in Indiana classified under the heading, 'Rubber goods, not elsewhere specified,' manufacture automobile tires."

The increase in number of cars produced during the five-year period between 1904 and 1909, insofar as the report can be made without disclosing individual operations, is best set forth in the following table:

Pleasure Cars—	1904		1909	
	No.	Value	No.	Value

NEW CARBURETOR COMPANY.

Organization Perfected for the Production of Miller Device in Indianapolis.

The New-Miller Manufacturing Company has been organized in Indianapolis for the production of the Miller carburetor, which first made its appearance in Los Angeles some few years ago. Although no attempt was made to exploit the device through the country until during the Madison Square Garden show in January, 1911, it has been impossible for the Miller Carburetor Company, which originally undertook its manufacture, to take care of the demand. The new concern has acquired a substantial factory in Indianapolis and its executive offices are located in the Murphy building in that city.

The Indianapolis plant will have a capacity of over 70,000 carburetors a year. The officers of the company are: President, F. C. Fairbanks; vice president, A. W. Nash; secretary, K. K. Parrot. L. H. Colvin, formerly sales manager of the Warner Manufacturing Company, Toledo, O., will act as general manager of the organization.

It is claimed that the Miller carburetor is a distinct departure. It is operated mechanically, the opening of the throttle introducing exactly the proper proportions of gas and air into the cylinder, and it is held that when it once has been set will supply this mixture at all speeds. The control is so constructed as to be attached either to the dash or the steering post, and by it the driver is enabled to regulate the flow from the seat, making it unnecessary to raise the hood and adjust the vaporizer for different grades of gasoline or because of climatic conditions.

UNITED STATES RUBBER PLAN.

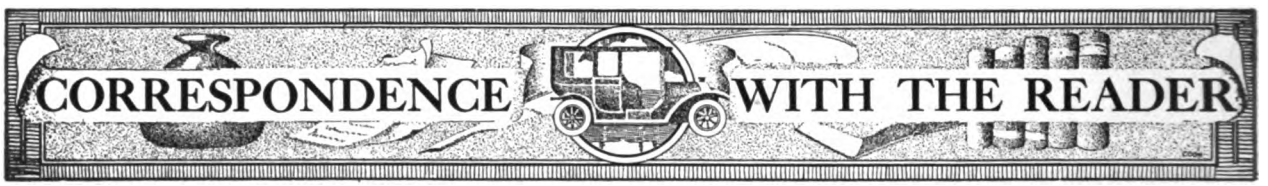
Will Increase Capital Stock from $75,000,000 to $120,000,000 for Expansion Needs.

At the annual meeting of the United States Rubber Company in New Brunswick, N. J., May 22, President Samuel J. Colt reported that the company found it desirable to increase its cash capital by $10,000,000 to finance manufacturing extensions and to take care of increased production. The plans suggested called for a total authorized capital stock of $120,000,000. instead of the present $75,000,000, this to be divided into $40,000,000 common and $80,000,000 preferred shares. The increase will be represented by $15,000,000 common and $30,000,000 preferred, the distribution to be as follows:

A dividend of $5,000,000 of the new common stock to present stockholders which would be at the rate of 20 per cent. of their present holdings. Ten million dollars of first preferred to be offered ratable to all stockholders at par and accrued dividends. To submit an offer to the holders of the present second preferred issues to exchange their stock for the new first preferred on a basis of 100 shares of the existing second preferred for 75 of the first preferred.

GRAMM'S FUTURE PRODUCT.

Will Produce New Models Instead of Collaberating with Willys in Old Company.



When announcement was made recently that John N. Willys, president of the Willys - Overland Company, Toledo, O., had purchased the controlling interest in the Gramm Motor Truck Company, Lima, O., it was stated that B. A. Gramm, who designed the Gramm truck and built up the business, would be associated with him in perfecting the details of the new organization. Mr. Gramm now explains that such was his original intention, but upon more mature reflection he has decided that this should prove an opportune time for him to bring out some new designs, which be believes will reflect the standard of the future.

B. A. Gramm, Designer, Gramm Motor Truck.

It is understood that Mr. Gramm has secured a new factory in Lima and that he has associated with himself a strong organization, which will proceed with plans for the production of new models. These are to be worked out thoroughly and given every test before being placed before the public. Beyond the bare information that the new trucks will be simple in design and construction, with few working parts, accessible in every detail and embodying features of comfort for the driver, absolutely nothing is known concerning them. Additional news concerning the factory and the product will be awaited with interest by those in the industry.

Digitized by Google

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Mixing Acetylene with Air.

(1383)—What is the minimum and maximum amount of acetylene that can be mixed with air which will ignite readily from a spark? About what pressure can a mixture of nine parts air to one part acetylene be compressed without danger of being exploded? Can a mixture of the above proportions be drawn into a pump and forced through a small brass tube without danger of being exploded from the pressure or friction produced? If a mixture of the above proportions were injected into a cylinder just after the motor stopped, would there be any probability of the gas being exploded when the same came in contact with the hot inner walls of the cylinder? G. B. H.

Merkel, Tex., May 29.

According to O. H. Skinner, general superintendent of the Prest-O-Lite Company, Indianapolis, the proportions for perfect combustion are approximately nine parts air and one acetylene. Such a mixture burns with an explosive wave when ignited. It should not be compressed except under those conditions existing in the cylinders of an internal combustion engine running in the usual manner. If such mixtures of gas were compressed in the compressor so that absolutely all heat of compression were removed it might possibly be done with safety. However, it must be borne in mind that the violence of the explosion increases as the pressure increases, and should such a mixture become ignited there might be danger. Such mixtures taken into the engine in the usual manner through the manifold are not subjected to compression so great that there is any danger of injury to any part of the machinery when the gas is ignited.

Regarding the probability of acetylene exploding by coming in contact with the hot inner wall of the cylinder: This would depend upon the temperature of the metal. It is doubtful if the metal would be warm enough at any time to ignite the mixture; that is, no more so than if the gasoline mixture were utilized. When a cylinder becomes so warm that it will explode any gas vapor with the ignition switched off, the motor should not be operated until the cause for overheating has been removed.

Horsepower Formula.

(1384)—Can you secure for me or advise where I can get the formula for computing horsepower. For example: What is the horsepower of a motor having a 4.25-inch bore and 5.75-inch stroke? If this is not asking too much, I would like to see it figured out.

J. E. BUCKLEY.

Kansas City, Mo., June 1.

The formula adopted by the Society of Automobile Engineers, which is standard, being generally utilized, is based upon a piston speed of 1000 feet a minute. It consists of squaring the bore and multiplying the result by the number of cylinders and dividing by 2.5. The horsepower for a four-cylinder motor of the bore mentioned is 28.9.

Peculiar Knock.

(1385)—I have a Flanders 20 touring car, and the engine has a peculiar knock that I am unable to locate. It is only noticeable when the motor is operating at low speeds. I have inspected the connecting rods, tappets and valves. All are in prime condition. The car has plenty of power and runs nicely, only this knock is annoying. Could it be that the muffler is dirty? Please give me your opinion as to the probable cause.

M. F. GENOH.

Rich Hill, Mo., May 22.

It may be that the knock referred to is caused by a loose wristpin which might operate quietly when the motor was pulling steadily and under a load. The main bearings may need attention. It would be well to examine these parts and test for looseness. Sometimes when the motor is throttled down and the spark too much retarded a form of knock will be heard. Advance the spark and note if the knock continues. A dirty muffler would hardly cause the noise referred to. A clogged silencer creates back pressure, reduces the power of the engine and sometimes makes it difficult to start.

Horsepower Ratings.

(1386)—I would be pleased to ask which would have the most power, a six-cylinder motor having a four-inch bore and 4.75-inch stroke or a four-cylinder motor having a 4.5-inch bore and 5.25-inch stroke? Which motor would be the most economical of fuel?

JOHN L. AGNES.

Falun, Kan., June 1.

The horsepower of the six-cylinder motor according to the S. A. E. formula is 38.4, while that of the four-cylinder engine is 32.4. The latter should be more economical of fuel, all other things being equal.

Dual Ignition.

(1387)—Will you please answer the following questions? In a dual ignition system is the high-tension jump spark coil used by the high-tension magneto? I should think that the high-tension coil would be used only to transform the current of the

Digitized by Google

batteries. What causes the magnetic vibrator of a jump spark coil to stop by sticking to iron core of the coil? What causes the gasoline to run out of the main air supply chamber of the carburetor in a stream while cranking the engine, both in hot and cold weather?

ELMER S. SMITH.

Nora, Neb., May 20.

The term "dual ignition" is meant to apply to two sources of current such as a magneto and batteries. A coil, such as referred to, is utilized when the magneto generates a low-tension current. The step-up coil or transformer builds up the current which is led back to the magneto and distributed to the proper spark plug.

With a true high-tension magneto its armature carries two windings, a coarse and fine, primary and secondary, respectively, these being similar to those employed in the high-tension coil. The current from the magneto is led direct to the plugs.

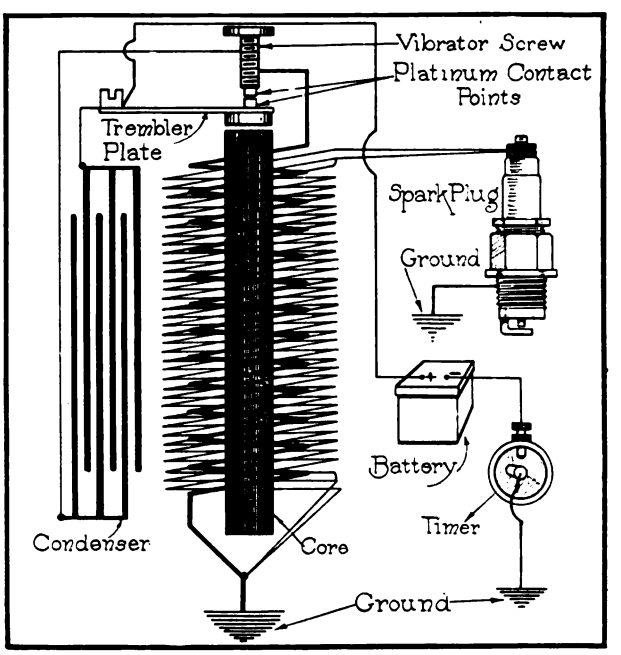
A true dual ignition is two separate and distinct systems, each operating independently of the other. A battery, timer or distributor and coil are included in one group and the current is led to a set of spark plugs. The magneto is of the true high-tension type and its current is supplied to another set of plugs.

Regarding sticking of the vibrator of a jump spark coil: It is probably due to the fact that the core does not lose its magnetism and release the vibrator. The action of a high-tension coil is depicted at Fig. 1 which outlines the member, also the battery, timer and spark plugs, as well as the primary and secondary circuits. It will be noted that one wire leads from the positive terminal of the battery and this in practise is attached to the "battery" terminal of the coil and a switch provided for the interruption of the current.

Another wire from the battery is led to the frame of the car, which being of metal is a conductor. This lead is called a ground. In the sketch this lead is shown going to the timer, which is practically a second switch in the system. It will also be seen that the bottom of the plug is grounded. With both the primary and secondary currents it is essential that a return path be established for the electricity.

When contact is made at the timer, closing the primary circuit, current flows to the primary or coarse windings of the coil. This excites the soft iron core, causing the latter to act as a magnet and draw down the trembler blade. In this operation the platinum points are separated and the circuit broken. When the current ceases, the core loses its magnetism and releases the blade which springs upward remaking the connection. This re-establishes the circuit and the core is remagnetized, this continuing at rapid speed. At the instant the platinum points separate, the secondary current is built up to a very high point and flows through its circuit, in which is placed the spark plug.

Relative to the third question. The trouble is doubtless due to flooding or leaking. It may be that the float is too high or dirt may have become lodged in the needle valve seat preventing the valve from seating properly. The correct point for the fuel level is between .03125 and .0625-inch. The float should be examined for leaks, as the cork may have become impregnated with fuel.



Motor Heats.

(1388)—I have a 1910 model T Ford and am having some trouble with the motor overheating. I am using Polarine oil so do not think the trouble can be due to the lubricant.

J. H. WEBB.

Carterville, Mo., May 21.

The trouble is not due to your lubricant but may be caused by several things. Too rich or too weak a mixture, carbon, or operating with a retarded spark will produce heating. Among other causes may be mentioned improper timing or too insufficient lift of the exhaust valves. The circulation system may be

Outlining the Action of a High-Tension Coil.

clogged partially, or the fan belt be loose. The water pump should be examined as it may not operate at its proper efficiency. It may be that the muffler is filled with soot, creating back pressure.

Motor Will Not Throttle.

(1389)—I have just purchased a new car and when running on the magneto it will stop if I try to throttle it down. I keep the spark advanced but the engine will run a short time and finally come to a stop. It will run all right on the batteries. The agent stated that the magneto was at fault and put on a new one. The engine now throttles. What was the cause of the trouble?

B. D. M.

Harrisville, R. I., June 5.

It may have been due to the magneto as the agent stated. Presumably the magneto was timed a trifle late and the agent merely retimed it and obtained the desired result. Some magnetos will not permit the car to be throttled to exceedingly low speeds.

Grades and Gear Ratios.

(1390)—Kindly tell me how to calculate grades as to percentage, also how to figure the gear ratio of the transmission? DANA A. LANE.

Hazardville, Conn., May 29.

The most common way of designating a grade is in per cent. This is figured on a given horizontal distance of 100 feet, for example, and the difference there is in the height of the hill at either end of that 100 feet. If the rise be 10 feet, the ratio is 10-100 or 10 per cent. Similarly, any rise as 17 feet, is 17 per cent., always remembering that the horizontal distance is 100 feet. A 100 per cent. grade would be one in which the rise was 100 feet in horizontal distance. Shorter horizontal distances, of course, can be used in figuring, as, for instance, a rise of three feet in 10 equals 3-10, or 30 per cent. Or one foot in 20 equals 1-20, or five per cent. With a rise of five feet in five, 10 feet in 10, 100 feet in 100, or whenever the rise is equal to the horizontal distance, the grade is 100 per cent. or 45 degrees.

In measuring grades in degrees, the foundation is the circle which contains 360 degrees. A line drawn horizontally across the circle through the centre is the level and a point in the circumference is considered as the top of the hill. Then a line drawn from this point to the centre of the circle would form an angle with the horizontal line, and the angle would contain as many degrees as there were degrees in the circumference of the circle between the point considered as the top of the hill and the point where the horizontal line cuts the circumference. The side of a house forms a 90 degree angle with the street level. Cutting this in two would give a slope, as on the roof of a dwelling, an angle of 45 degrees.

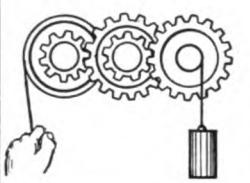
No motor car could stand on this grade or climb it, unless some other means besides ordinary roads and tires were used. It has been found that ordinary traction ceases on a slope of about 26 degrees or a 57 per cent. grade. A simple method of measuring grades is to attach a piece of stout string to a top iron or any other convenient place on the automobile, and as near as possible over the edge of the running board. The twine should be long enough to drop a few inches below the board. Next tie a weight to the free end, taking care that the twine moves freely so that the weight will act similarly to a pendulum.

Next drive the machine upon a level space, such as the floor of the garage, and mark the intersection of the string on the edge of the running board. The string now hangs perpendicular from the point where it is suspended. In driving up a hill the twine will move backward and in descending a grade it will move forward. As the car stands upon the grade to be measured, mark the spot on the running board where the string intersects. For convenience call the point where the twine is attached A, the point of intersection on running board B, and location of string when on a grade C. The length of C B is to the length of A B as the per cent. of the grade of the unknown slope is to 100 per cent. For example: If it be eight inches from B to C and 40 from A to B, then the per cent. is equal to eight divided by 40, which results in a fraction of one-fifth or 20, thus determining the grade to be 20 per cent.

A free swinging pendulum and a scale marked on a piece of board to swing either way from zero is made easily and also may be utilized. There are devices called gradometers which are not expensive and these register the grade. They are attached to the dash or any other convenient place.

In figuring the gear ratio of the transmission the gears and pinions of the main and secondary shaft are taken into consideration. Suppose for example that the engine shaft extension carries three gears, beginning at one end, respectively, 19, 32 and 48 teeth, and that the sliding sleeve bears gears of 77, 64 and 48 teeth, respectively. When the 77-tooth gear on the sleeve is slid into mesh with the 19-tooth gear upon the engine shaft, the speed ratio is about four engine turns to one sprocket turn, and the low speed is engaged. When the sleeve is moved until the 64-tooth gear on the sleeve meshes with its 32-tooth mate, the two-to-one or intermediate gear is obtained, and when by a further motion of the sleeve the two 48-tooth gears are meshed, the engine and sprocket shaft are rotating at equal speeds and the car is running on the high. In estimating car speeds the final gear; that is, the ratio between the pinion or driving gear on the shaft and crown gear, should be taken into consideration.

STUDEBAKER METZGER NEWS.



While rumors concerning the retirement of W. E. Flanders and E. LeRoy Pelletier from the Studebaker Corporation of Detroit, to become associated with the Metzger Motor Car Company of Pontiac, Mich., have been circulated frequently of late, no definite information has been made public concerning the situation, with the exception that J. N. Gunn, now general manager of the Studebaker forces, has announced the appointment of W. S. Pettit, who has been with the Studebaker organization for the past year, to replace Mr. Pelletier as director of advertising. Mr. Gunn also announces the appointment of Charles Gordon as factory manager, vice Charles Adams. The Metzger company is said to have secured a number of Studebaker branch managers.

NEW IDEAL COMPANY OFFICERS.

The Ideal Motor Car Company, Indianapolis, Ind., maker of Stutz cars, has elected the following officers: President, Harry Stutz; secretary, J. H. Ebersole; treasurer, H. F. Campbell. Mr. Campbell, who is president of the Stutz Auto Parts Company, succeeds E. G. Sourbier, who has retired from the Ideal company. Carl G. Fisher, president of the Indianapolis Motor Speedway, and Frank L. Moore have taken the Stutz agency for Indiana.

RECENT MOTOR VEHICLE PATENTS

Stewart Auxiliary Valve.

A patent has been granted to Alfred C. Stewart, Los Angeles, Cal., for an auxiliary air valve applicable to the intake manifold or pipe of an internal combustion motor. It comprises a cylindrical casing, one end of which is reduced and threaded to fit the manifold. The reduced part has a shoulder forming a seat for a movable valve which seats in a manner similar to a poppet valve. Attached to the valve member is an operating wire enclosed in a flexible housing which leads to any convenient point for service. Near the valve are apertures through which air is drawn when the valve is moved from its seat, and the amount of atmosphere may be regulated.

Wheeler Locking Device.

To prevent the use of the automobile by others than the owner or those intended, Charles A. Wheeler, Bridgeport, Conn., assignor of one-half to the Smith & Egge Manufacturing Company of the same city, has patented a locking device for motor car cranks. It comprises a substantial chain having an elongated socket formed of a series of wire convolutions, one end of the wire being pivotally connected to the chain. The other end is equipped with a padlock. In attaching, the socket is utilized for the handle of the starting crank, the chain wrapped tightly around the cross bar or other suitable place and the padlock secured.

Liebau Vehicle Spring.

A patent for a vehicle spring which presents unusual features, inasmuch as it is designed to combine the function of a spring and shock absorber, has been granted to Richard Liebau, Watervliet, N. Y. Instead of the lower section of the spring being mounted upon the axle it is divided into two sections, that from the body or frame being fastened securely above the axle while the other extremity is pivotally mounted to an extension of the frame. Attached to the goose neck is another spring member, this being secured by a link, while the other end is pivotally mounted and held under the axle. Interposed between the spring and frame is a pneumatic cylinder, also pivotally mounted.

Edgington Chain Tool.

In attaching tire chains, especially worn members, it is sometimes difficult to tighten the chain properly and at the same time snap the retaining hooks into place. William F. Edgington, Springfield, O., assignor of one-half to Alexander Murray of the same city, has invented a chain tightener which consists of two levers, one of which is pivotally mounted and carries a pawl which engages with the smaller member. Both arms are equipped with hooks, these being so constructed as to fit and engage between the links of the outside chain. When the main lever is moved the action brings the hook members together and by means of the ratchet and pawl mechanism the tool is locked, allowing the securing of the locking members of the chain.

Smith Valve Lift Spacer.

Charles W. Smith, Annapolis, Ill., has been granted a patent for a valve lift spacer for internal combustion motors. It comprises a valve mechanism, combining an inlet controlling valve having a stem, and a sleeve mounted upon the latter, and having a screw threaded exterior. Longitudinal grooves intersect the threads, and a valve closing spring and spring lock device are mounted upon the sleeve. The spring is bent into circular form and has a loop at one end and an eye at the other extremity laterally deflected and adapted to interlock with the terminal loop to secure the ends of the wire when brought together. It also has loops or crimps to form a support for the valve closing member and means for contracting the locking device about the sleeve.

Beers Lock Washer.

A patent has been issued to Charles F. Beers of Newark, N. J., for a lock washer which comprises a spirally shaped body having a number of concentric ridges which are triangular in cross section. It is claimed by the inventor that such an arrangement will retain nuts, etc., more securely than those of the spring form.

Myers Bumper and Fender.

Harry T. Myers, Chicago, has been granted a patent for a combined bumper and fender which comprises a two-part bumper and an apron. The upper and lower edges of the latter are attached to the bumper and in a normal position are compactly arranged. Means are provided for opening the apron automatically as well as for separating the parts of the bumper to stretch and hold the apron.

OTHER PATENTS GONE TO ISSUE.

Terminal, William C. Brunt, Boston. A fork shaped spark plug terminal provided with an insulated handle and a set screw to hold secondary wire in said handle.

Steering-Driving Mechanism, Felix A. Eisner, Rochester, N. Y. A driving and steering system in which all

Digitized by Google

four wheels are driven by means of a fluid motor, provision being made in the fluid connections to steering wheel to give differential power effect in turning.

Tire Inflator, Royal L. Foster, Fort Riley, Kan. A rotary pump attached to the axle and wheel spokes, pumping air direct to the tire and to a pressure chamber.

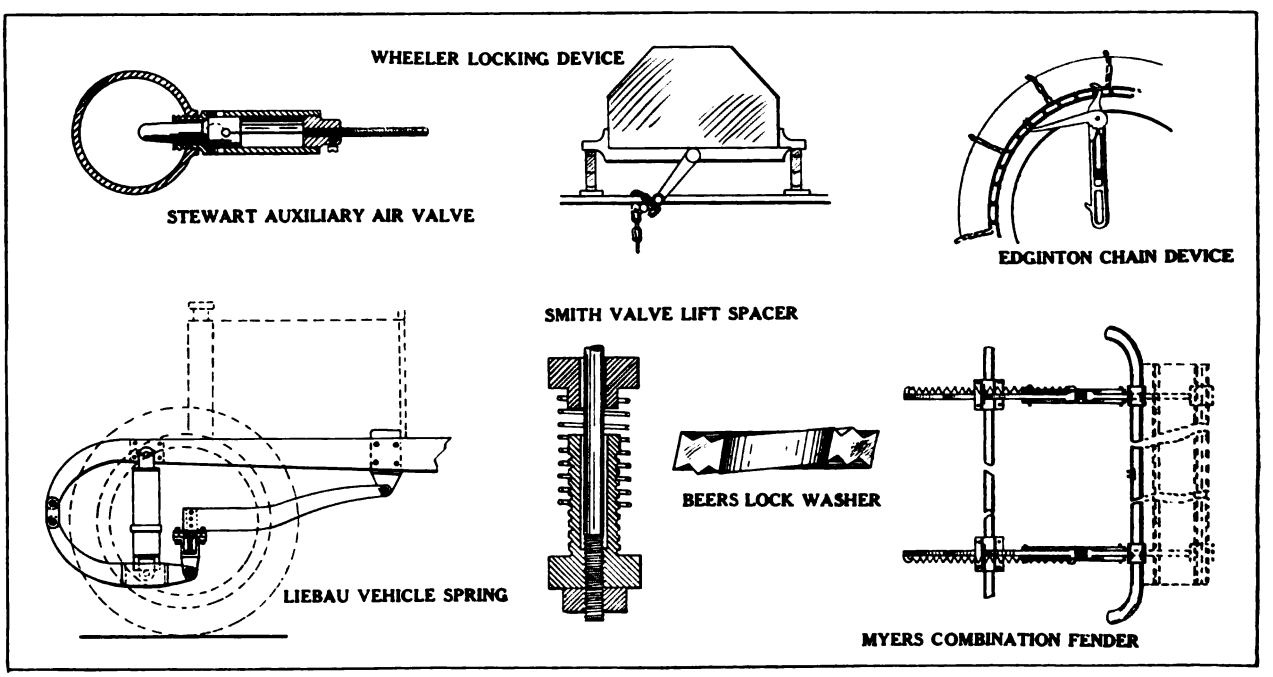
Faucet, Frank M. Ulmer, Philadelphia. A lock faucet for gasoline or other fluids, in which a lock is embodied, the insertion of key in handle being necessary before same can be turned.

Lighter for Gas Burners, Stewart Brown, Chicago, Ill. A spark gap for acetylene burners, in which the sparking wires are held in a base which is movable by means of a thumb screw, enabling it to be adjusted.

Bearing, H. E. Coffin, assignor to the Chalmers Motor Company, Detroit. A bearing for a motor crankshaft, consisting of a disc attached to the shaft between the cranks and bearing on an annular soft metal seat in the crankcase, giving a bearing for each end of each crank and also separating each into a separate gas tight compartment.

Running Gear, David M. Dearing, Jackson, Mich. Automobile running gear in which two members are hinged at the middle, the upper being attached to the frame

holds the bulb forms part of the reflecting surface of the lamp.



Rotary Motor, Olof F. Edqvist, Denver, Col. Cylinders are mounted on fixed shaft so that their produced axes do not intersect the axis of rotation. Provision is made to lock pistons against travel and for varying their speed in relation to the cylinders.

Hub Odometer, H. P. C. Browne, New York City. An odometer in combination with the hub cap of a wheel, the cyclometer being operated by means of a plug inserted in a hole in the stationary axle.

Starter, Cornelius Van Tubbergan and Paul Westrate, Grand Rapids, Mich. A starter of the spring type, the spring being attached to a sleeve which may be fitted to the engine shaft by means of a clutch.

Lamp, John H. George, Bridgeport, Conn., assignor to the Hawthorne Manufacturing Company, Inc. An automobile lamp with the reflector held in a holder of sheet metal provided with a threaded projection extending beyond the casing, enabling adjustment of the reflector.

Wrench, George Jurkovitch, Homer City, Penn. The parallel jaws of this both slide upon a frame, to the opposite ends of which handles are attached, so that the jaws are midway between the two handles.

Outlining Some of the Ideas of Inventors Working Along Lines Applicable to the Automobile.

by the usual elliptic springs, and the lower to the axle. Between the ends of the members are coil springs, so that while the axle may be moved from the horizontal without affecting the elliptic springs, the resistance of the coil springs is met.

Motor, Simon Lake, Milford, Conn. A two-cycle motor in which a chamber is formed in the head, into which gasoline and air is injected to be transformed into a gas by the heat of the chamber and then forced into the combustion chamber by means of air from a pump. The base of the cylinder is also scavenged by a jet of air.

Carburetor, F. H. Walker, Lincoln, Neb. A carburetor for starting motors, in which an inner chamber may be filled with gasoline from which an especially rich mixture can be drawn.

Pneumatic Cushion, F. L. Baker, Orange, Mass. A pneumatic spring, in which the compression chamber is separate from the plunger guides, being between them.

Radiator, J. B. Beam, Punxsutawney, Penn. An automobile cooler in which the radiating sections are removable from the frame.

Lamp, Percy Avery, Milwaukee, Wis. An electric automobile headlight in which the electric bulb may be inserted and removed from the back, without disturbing the glass front. The inner surface of the portion which

Carburetor, Francis P. Johnson, Oakland, Cal. Is provided with a chamber containing a number of horizontal plates, over which air is forced through the gasoline from the bottom to the top.

BOSTON TO HAVE ORPHANS' DAY.

The annual automobile outing of the orphans and the blind and crippled children of the city of Boston is to be held in the near future, under the auspices of the Boston Automobile Dealers' Association. Chester I. Campbell, the well known show promoter, has the affair in charge and is busy enlisting the aid of private owners, appealing to them for cars. The responses so far have been generous.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

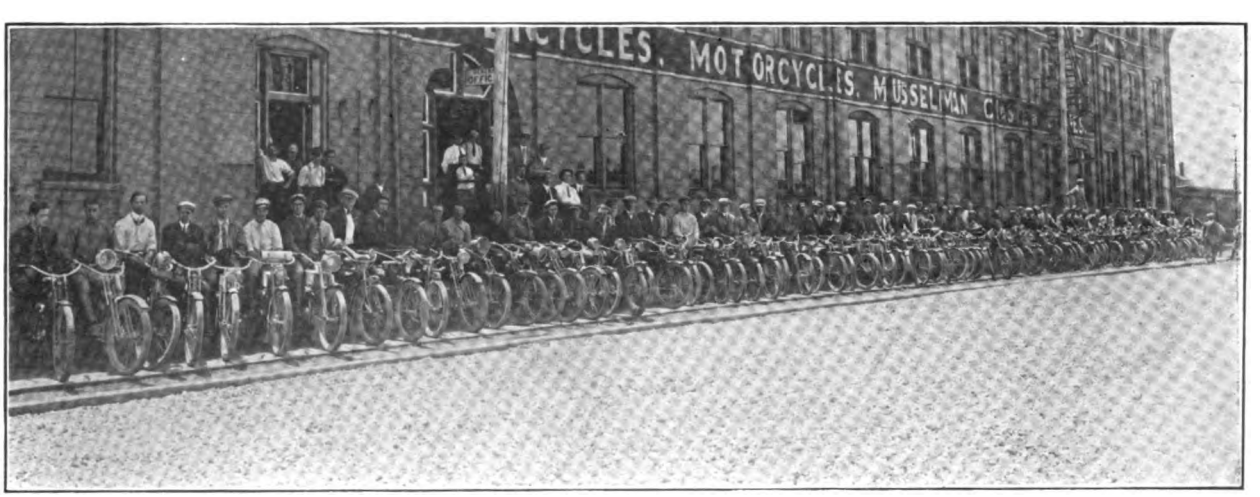
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Presidential Candidates.

This is presidential year, and it would appear that some of the political ideas which have been noticeable in national politics are to be more or less prevalent in the Federation of American Motorcyclists. This does not mean that there is to be "mud slinging" at President G. H. Hamilton, who has made such an excellent chief executive that there is little doubt of his re-election, providing he makes known his decision to run again. However, there are other candidates, despite the fact that it has been an established practise of late to give a man a second term.

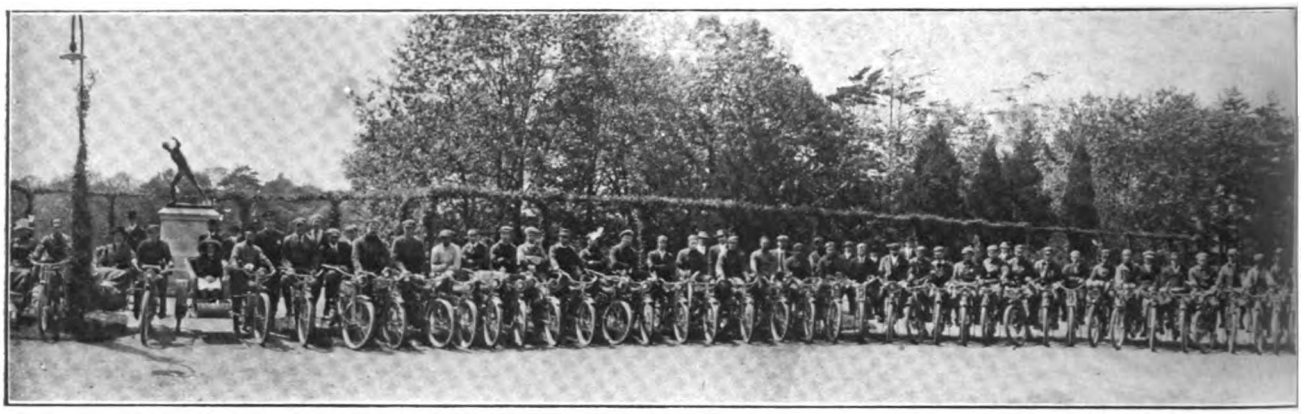
P. E. Zimmerman, general manager of the Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., and local commissioner, places in nomination the name of Dr. B. J. Patterson of Pratt, Kan., now vice president of the Central District. Those who are at all acquainted with motorcycling matters know that Dr. Patterson has a reputation for doing things. In the first place, he is a physician and surgeon with large practise, yet he finds time to direct a band of 50 pieces, sufficiently well known to receive an invitation to attend the Democratic national convention in Baltimore.



In the motorcycle field, Dr. Patterson writes from 25 to 75 letters a day as vice president of his district, helps arrange and personally supervises all racing events in Kansas, and is an officer and prime mover in the Kansas Short Grass Club. All this is on the authority of Mr. Zimmerman, and to him this seems to be sufficient recommendation for a president of the F. A. M.

Then, there is Dr. C. W. La Salle of Rochester, N. Y., vice president of the Atlantic District. Robert S. Morton of Brooklyn, N. Y., is his sponsor. He was a candidate last year, but withdrew in favor of Mr. Hamilton.

Some mention has been made of E. M. Estabrook, Bangor, Me., chairman of the membership committee, but Mr. Estabrook made it very plain last year that he did not want the office, although it was stated that he could have it merely for the asking. In fact, his name would have been presented as a candidate by the old New England District, except for his refusal to run.



Mention also has been made of Dr. J. B. Thornley, New York City, chairman of the competition committee, but Dr. Thornley disposes of his case as follows:

"As long as President Hamilton, who has done conscientious work, and has been fair and square, wants the presidency, there is no consideration conceivable which would induce me to run. My wishes,

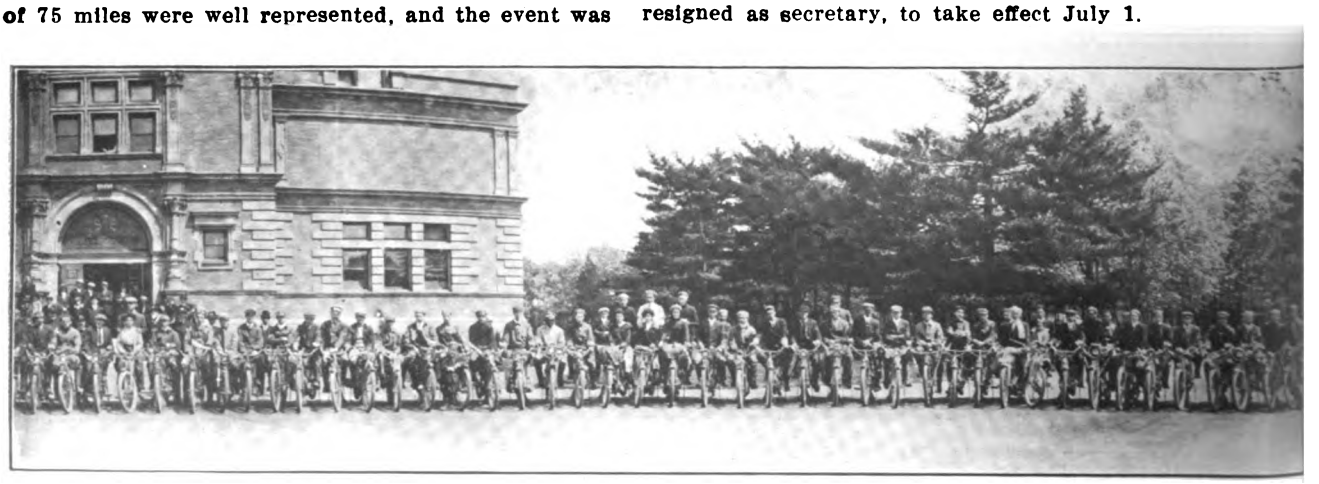
Members of the Queen City Motorcycle Club of Cincinnati and the Dayton Motorcycle Club of Dayton, Visiting Merkel Plant in Middletown, O.

Digitized by Google

and all my efforts as far as I would feel justified in making any effort in a political game, would be thrown on President Hamilton's side. Should Hamilton wish to withdraw and should he do so, I would consider it one of the worst misfortunes that had ever confronted the F. A. M. Then, it might be conceivable that I would run if a nomination were presented to me in such a way as to make it apparent that I was serving the very best interests of the F. A. M. by running for the office. I most certainly do not want it, and while I would appreciate the honor, I feel that I am far better fitted to do the work for the F. A. M. in my present position than I would in the office of president."

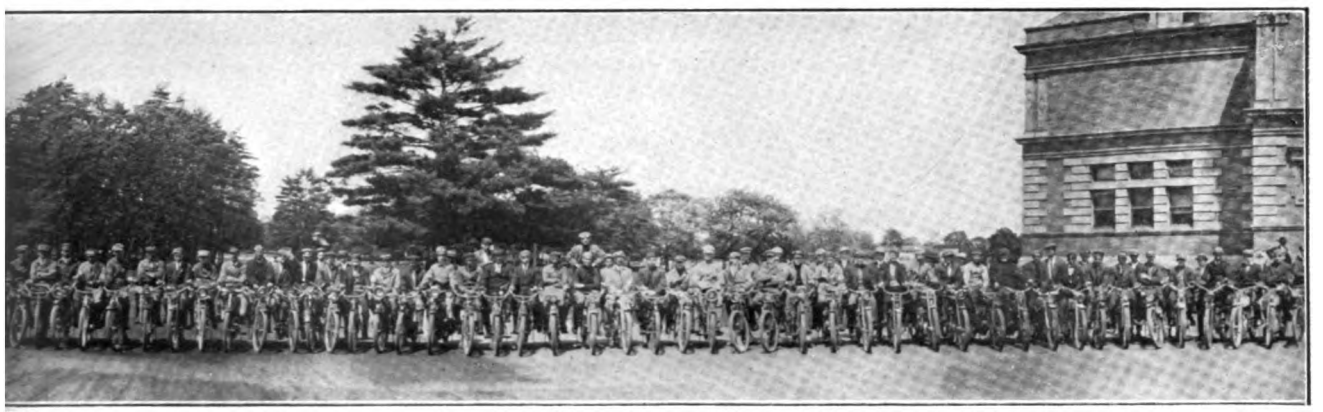
It really looks, at this time, as if President Hamilton would be renominated and elected and there seems to be no good reason why this should not be true. It all depends upon whether or not he wants the office, and so far as can be learned he has made no statement which would indicate that he intended to withdraw.

The Annual Picture Run.



The annual picture run of the Providence Motorcycle Club, Providence, R. I., was held May 26, some 150 riders being in attendance. But for the fact that a thunder storm broke over Rhode Island and southeastern Massachusetts early in the morning, the crowd would have been much larger. Clubs within a radius of 75 miles were well represented, and the event was by all means the most successful ever held.

The moving picture part of the programme failed to materialize. Wm. Mills & Son, of Providence, which has taken this picture for a number of years, again had the honor. In fact, had the moving picture men been on hand as promised, the Mills concern still would have retained its position as official photographer. This year's picture was taken on a six-foot film, and the result is indicated in the accompanying reproduction. As will be noted, the picture had to be cut into four parts in order to be presented on the two pages.



After the session before the camera, the visiting riders were taken to Motorcyclists' Rest, the new home of the Providence Motorcycle Club in the Swenson building, Blackstone and Broad streets. Although the new clubrooms were not ready for occupancy, the visitors were shown over the place and all agreed that Providence would have one of the most enjoyable homes in the country. It was made plain that riders from other cities always would be welcome at Motorcyclists' Rest.

Rhode Island Club.

The Rhode Island Motorcycle Club, Providence, R. I., has secured new quarters at 10 Earle street, and the members are expecting increased interest as a result. Several of the riders went to Newport, R. I., on the annual Lobster run, June 2. W. L. Medhurst has resigned as secretary, to take effect July 1.

Ohio Riders Visit Merkel Plant.

More motorcycles were seen in Middletown, O., May 26, than ever before graced the city streets, despite the fact that one of the largest motorcycle factories in the country, that of the Merkel, operated by the Miami Cycle & Manufacturing Company, is located there. The occasion was the invasion of the city by the members of the Queen City Motorcycle Club of Cincinnati and the Dayton Motorcycle Club of Dayton, for the sole purpose of inspecting the Merkel plant.

Both divisions picked up a number of stragglers on the way, and all told there were something over 100 among the guests, who were liberally entertained by President J. R. Jacoby, Treasurer H. S. Wise, Sales Manager James W. Ash, Superintendent Charles R. Miller and Chief Engineer Joseph Merkel. After inspecting the plant, the riders sat for the accompanying picture, then paraded through the town to the United States hotel where luncheon was served with Mr. Ash as host. The following signed the Merkel guest book.

Cincinnati—M. Fischer, president, Harley-Davidson; Charles Laile, Jr., Thor; John Heck, Harley-Davidson; Herbert Tolbert, Harley-Davidson; Charles Weigart, Merkel; S. Wise, Curtiss; J. L. Alaska Club Coming.

Since motorcycle clubs have been organized in the Philippines and the Canal Zone, the Federation of American Motorcyclists is looking to Alaska to present the next unit in the Insular District. William F. Merchant, manufacturers' agent, broker, dealer and enthusiastic rider, whose address is P. O. box 171, Juneau, is anxious to hear from the riders in that section with a view to the organization of a representative F. A. M. club.

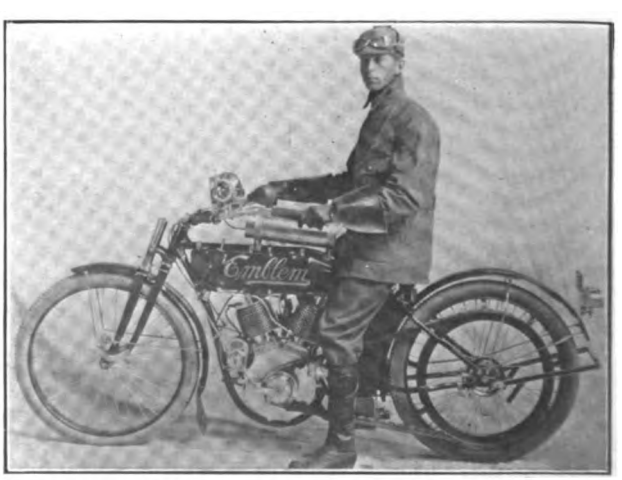
A Message from Estabrook.

E. M. Estabrook, chairman of the F. A. M. membership committee, says:

"Considering the near approach of the annual meeting of the national assembly, perhaps it would be timely to call the attention of the F. A. M. officials and the members generally to the present working conditions of our state units as shown by the official list of county and local commissioners' names by our state commissioners.

"Seventeen states show organization work as follows: One state with 62 commissioners appointed, one with 36, one with 31, one with 23, one with six, two with three, and the balance with one or two assistant workers. This would seem to mean that we have about five states in the F. A. M. who are working along lines calculated to produce the best results. In the balance, the state commissioner is content to do, or not to do, a little local work.

"This is not intended to be a fault finding letter, as the chairman is fully aware of the conditions and circumstances bearing on the work of the state commissioner, for he has 'been there' himself and didn't do any great shucks either. But he did do this much: He appointed a commission in each town, where there was one or more F. A. M. members. There were about 30 members in the state after two years of hard endeavor.



"Such facts or conditions as I lay bare are merely to assist our officers or delegates to a better understanding of the working conditions, in order that they may devise some more efficient system or suggest ways of improving the present one.

"While organization may not prove in all cases that it is efficient and rolling up the membership, still I believe in it and the principle. It offers possibilities at least, while with only one lonely state commissioner spread over a whole state, it makes the F. A. M. look exceedingly thin.

"I believe the rule to work is to appoint a commissioner for every town and hamlet in which we have an F. A. M. member. Every county should have its county commissioner and all cities should have a city commissioner, who would appoint ward assistants.

"In order to bring about this desirable condition of F. A. M. organization, I would suggest that the measure of efficiency of a state commissioner be not by membership results, but by the number of commissioners he appointed to cover his territory as possible workers and assistants.

"This may seem to be taking a radical view, or seeking to rob the state commissioner of some credit, but I do not see it that way. Let us argue this a little: To begin with, the state commissioner is not the only one working in his state; there are the motorcycle journals teeming with interesting news most of which treats of F. A. M. races or other contests, club news, official F. A. M. news or subject matter for which the F. A. M. is responsible. Then, there are the advertisements of the F. A. M. sent out through many manufacturers' catalogues and house organs, and this is largely true of the jobbers and large dealers of the country. We also have some hundreds of F. A. M. clubs who are among our best workers, to say noth-

ing of some hundreds of club prospects who are continually making good, perhaps unknown to the state commissioner.

"More than this, there are probably many hundreds of dealers who do the F. A. M. a good turn whenever opportunity affords. Then, we have 500 registered repair shops, and these are organizing clubs and taking care of the individual membership with literature always on hand.

"Without brain work or effort the state commissioner who never wets a pen in the interests of the organization he represents—and there are a few of this class—can take to his credit whatever results accrue from this big array of publicity and actual work performed by others whom he knows not, and the press and the members at large accord him all the praise.

"Such district vice presidents as are not in touch with state representatives can also put on something of a front and point with pride to the achievements of this or that state commissioner of the dry pen variety, after reading Secretary Gibson's report of membership gains. There are a lot of F. A. M. men who would never have dreamed how much they had done, except for the reliable figures of the secretary.

"The drift of my remarks should make clear my reason for gauging the efficiency of a state commissioner by something more tangible than membership gains secured by someone else. If we put our commissioners up against the state organization problem measured by commissioners appointed, we shall see what we shall see."

Club Notes, Here and There.

The inaugural run of the Wisconsin Motorcycle Club, Milwaukee, Wis., was held June 2, the members going to Chicago and return.

The New Orleans Motorcycle Club, which was organized recently with 60 members, is preparing plans for a large clubhouse for its exclusive use.

Secretary Gibson is sending announcements to all motorcycle clubs concerning the election of delegates to the national assembly at Columbus, O., July 17-21. Any member may attend the convention, however, and enjoy all the privileges except voting.

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

A Pope Rider in Sacramento, Cal., Whose Machine is Equipped with Tandem Seat for a Companion.

More than 100 riders took part in the recent run of the Atlantic City Motorcycle Club, Atlantic City, N. J.

The Albany Motorcycle Club, Albany, N. Y., is planning a number of 200-mile endurance runs for the coming season.

San Jose, Cal., is planning a series of race meets similar to those held at Cresta Banca last year, at which there was an attendance of more than 15,000 riders.

The South Scranton Motorcycle Club, South Scranton, Penn., is planning a race meet for June 12.

Youngstown, O., wants more rigid enforcement of the speed laws and has added a motorcycle for the use of one of its police officers.

The Minneapolis Motorcycle Club, Minneapolis, Minn., has placed its official ban on the use of the cut-out.

Three Washington motorcycle clubs are going to build their own roads. Members of the Aberdeen, Hoquiam and Montesano organizations have voted to co-operate and construct a three-foot roadway between the three cities for the exclusive use of motorcyclists.

National Tour Secretary.

President Hamilton has appointed Guernsey Van Riper of 513 Hume-Mansur building, Indianapolis, Ind., as secretary for the 1912 national tour of the F. A. M. He is at present engaged in working out the entry blanks. Those desiring preliminary information should get into communication with Mr. VanRiper.

Would Organize Club.

William Skinner, with headquarters at the Southern Boulevard Garage, 179th street, the Bronx, New York City, is working up sentiment in favor of organizing an affiliated F. A. M. club among the riders of his vicinity. All motorcyclists are welcome at the garage, and those who are interested in the plan as outlined would do well to get into immediate communication with Mr. Skinner.

New Members for May.

According to Secretary Gibson, 986 new members were admitted to the Federation of American Motorcyclists during May, making a grand total of 15,348. Classified by districts the result is as follows: Lake, 412; Atlantic, 270; Southwestern, 97; Central, 57; New England, 53; Pacific, 40; Peninsular, 37; Insular, 18; Gulf, 13, and Canada, nine.

The result according to states was: Indiana, 125; Illinois, 118; Ohio, 113; New York, 90; New Jersey, 76; California, 73; Pennsylvania, 66; Massachusetts, 36; Kansas, 24; Michigan, 23; Wisconsin, 23; Georgia, 20; Washington, 19; Panama, 18; Missouri, 16; Maryland, 14; Iowa, 14; West Virginia, 14; Florida, 13; Nebraska, 11; Connecticut, nine; Canada, nine; Montana, nine; District of Columbia, eight; Minnesota, eight; Oregon, eight; Louisiana, six; Rhode Island, six; Colorado, four; Idaho, three; Tennessee, three; Texas, three; Kentucky, two; New Hampshire, two; South Carolina, two; Virginia, two; Arkansas, one; Oklahoma, one.

Campbell in Lake District.

Jesse Campbell of Dayton, O., has been appointed vice president of the Lake District, F. A. M., by President Hamilton, to fill out the unexpired term of P. B. Whitney, resigned.

Emblem Only Hill Climber.

In the recent hill climbing contest on Reservoir hill, Kansas City, Mo., there were eight single-cylinder machines, representing six different makes, entered and of these the Emblem, made by the Emblem Manufacturing Company, Angola, N. Y., was the only one to make the grade. This machine was started from a standstill and reached the steepest part of the hill without help from the free engine pulley or the pedals. Reservoir and Prospect hills are selected frequently for private tests, and thus far this year, the only

Herbert Kittle, a Well Known Racer of Los Angeles, and His Sister on an Indian Mount.

single-cylinder machine to climb either hill has been the Emblem.

Races at Saugus, Mass.

Two motorcycle races were held in connection with the aviation meet at Atwood park, Saugus, Mass., June 1, in which members of the Boston and Lynn clubs took part. The results follow:

Three miles, novice—First, E. C. Dupont; second, E. C. Hains; third, E. W. Putnam (all of Lynn club); time, 4:46.

Ten miles—First, H. F. Smith, Boston; second, Hains, Lynn; third, Charles Martin, Lynn; time, 11:52.

Boyd Takes State Championship.

The annual state championship race on the Tuileries track in Denver was won by Boyd on an Indian. The result of the meet follows:

Two miles, amateurs—First, Hurlburt, Indian; second, Parkhurst, Sears; third, Shepherd, Merkel; time, 2:26.4.

Three miles, professionals—First, Boyd, Indian; second, Bowen, Merkel; third, Cox, Merkel; time, 2:12.4.

Five miles, professionals—First, Bowen, Merkel; second, Cox, Merkel; third, Boyd, Indian; time, 3:49.2.

Three miles, consolation, professionals—First, King, Indian; second, Fleckenstein, Indian; third, Patterson, Merkel; time, 2:20.8.

Seven miles, state championship—First, Boyd, Indian; second, Cox, Merkel; third, King, Indian; time, 5:12.4.

Hasha Wins Prince Cup.

Riding an Indian, Edward Hasha won the Jack Prince sweepstakes cup at the Riverview track, Chicago, May 23. The event was scheduled for six miles but was cut to four on account of the slippery condition of the track. The summary of the meet follows:

Nine miles, class A, professional:

First heat, three miles—First, Hasha, Indian; second, Wolters, Excelsior; third, Balke, Excelsior; time, 2:05.4.

Second heat, three miles—First, Hasha, Indian; second, Graves, Excelsior; third, Balke, Excelsior; time, 2:06.2.

Final, three miles—First, Hasha, Indian; second, Graves, Excelsior; third, Balke, Excelsior; time, 2:07.

Nine miles, class B, professionals:

First heat, three miles—First, W. Samuelson, Indian; second, Armstrong, Indian; third, Humiston, Indian; time, 2:14.8.

Second heat, three miles—First, W. Samuelson, Indian; second, Humiston, Indian; third, Kenny, Indian; time, 2:18.

Final, three miles—First, W. Samuelson, Indian; second, T. Samuelson, Indian; third, Humiston, Indian; time, 2:19.6.

Four miles, amateurs—First, Matthews, Thor; second, Mitchell, M-M; third, Shaw, Thor; time, 4:28.4.

Six miles, cut to four, Prince sweepstakes—First, Hasha, Indian; second, Balke, Excelsior; third, W. Samuelson, Indian; time, 2:44.4.

Six Men Riding a Harley-Davidson, Along Elmwood Avenue in Providence, R. I.

Six Men on a Harley.

An accompanying illustration presents a test applied to a Harley-Davidson mount, made by the Harley-Davidson Motor Company, Milwaukee, Wis., by the Rhode Island agent, J. Clarence Loftes, Providence. The picture was taken as the machine was being driven along Elmwood avenue, and numerous witnesses were present to vouch for the fact. The men are Youngberg, Tromans, Loftes, Page, Gilbane and Korner. Their combined weight was 935 pounds.

ATTENTION MOTORCYCLISTS

Immediate deliveries of 1912 Indians, any Model. Cash or installment. Full line of equipments and supplies, also clothing for the Motorcyclist.

B. A. SWENSON

298 Blackstone Street, Providence, R. I.

The F. N. Shaft-Drive Motorcycles

Single cylinder with two-speed gear and handle bar control of clutch.....$275.00

(The only machine in the world possessing this incomparable feature.)

Four cylinder ordinary automobile engine, compound spring fork, two powerful brakes, footrests if specified, combined luggage carrier and stand, long wheel base and large tires.....$350.00

AMERICAN F. N. COMPANY **Boston, Mass.**

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Hassett & Rogers, Inc., Amesbury, Mass.; to manufacture automobile bodies; $18,000; incorporators, J. H. Hassett, C. H. Hassett, George H. Collins.

Standard Auto Sales Company, Philadelphia; $10,000; incorporators, R. M. Snyder, C. H. Friars, E. H. Weaver, 717 N. Broad street, Philadelphia.

Acton Tire Repair Company, New York City; $3000; incorporators, Patrick Curry, William Koopman, Lawrence Kerrigan, 759 Seventh avenue, New York City.

Simplex Aluminum Solder Company, Inc., New York City; to manufacture aluminum solder; $25,000; incorporators, C. B. Erkens, 255 West 143rd street; Charles Decker, Henry Bender.

Eiselman Automobile Company, Cleveland, O.; $10,000; incorporators, S. N. Weitz, J. W. Campbell, Harry Pott, H. C. Cummings, Alvin Boehmer.

Automobile Resilient Tire Filler Company, Indianapolis, Ind; $10,000; incorporators, W. H. Disher, A. C. Balfour, Jessie Moffat.

Merchants Motor Service Corporation, Philadelphia; incorporators, G. B. Teaz, William Voss.

White Automobile Company, Indianapolis, Ind.; $2000; incorporators, R. D. Eaglefield and G. W. Fuller.

Pitt Motor Truck Company, Pittsburg, Penn.; $20,000; to manufacture motor trucks; incorporators, J. E. Douglass, W. S. Phillips, F. O. Brandt, J. E. McCalmont.

Eckberg & Place Garage Company, Fall River, Mass.; $7000; incorporators, V. J. Eckberg, Ernest Place, Robert Place.

Lansden Electric Vehicle Company, Boston; $5000; incorporators, A. B. Freeman, Gardner Freeman, William H. Britton.

Smart Auto & Manufacturing Company, Indianapolis, Ind.; $50,000; to manufacture automobiles and parts; incorporators, O. S. Schrader, D. W. Reed, I. H. Shelton.

Storage Battery Safety Lamp Company, Wilmington, Del.; $550,000; incorporators, George Washington May, Artemas Smith, M. E. Dorsey.

Todd Rubber Company of New London, Inc., New London, Conn.; $2000; incorporators, E. J. Todd, Alfred Wurts, A. P. Gunn.

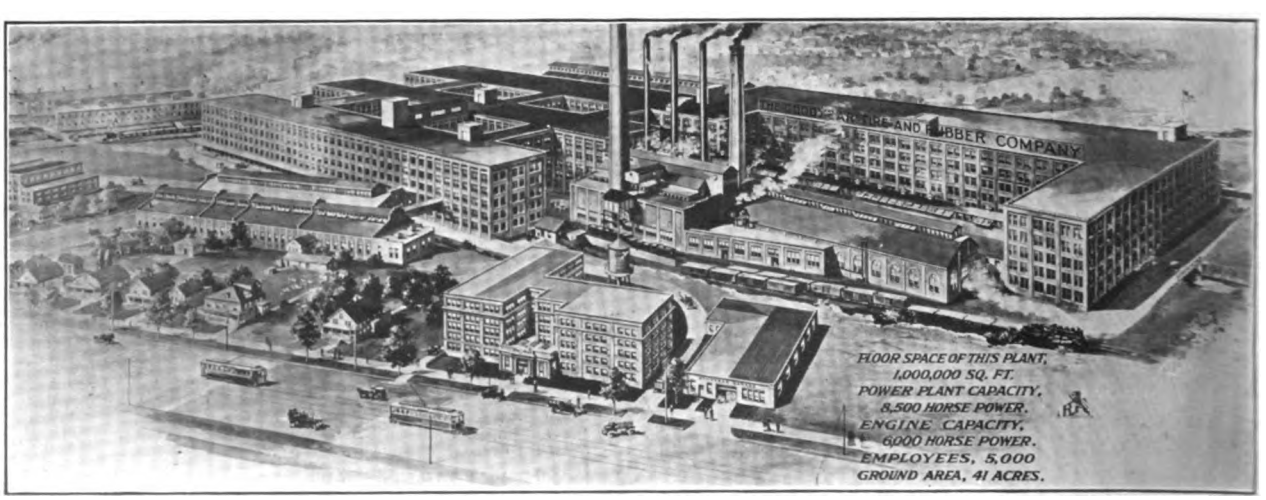
Todd Rubber Company of Waterbury, Inc., Waterbury, Conn.; $2000; incorporators, E. J. Todd, F. H. Potter, A. P. Gunn.

Blue Ribbon Garage Company, Springfield, Mass.; $2000; incorporators, Harry Bland, Albert Karp, J. G. Gottesman.

Jiffy Auto Curtain Company, Chicago, Ill.; $100,000; incorporators, Frank H. Ilse, 1505 Michigan avenue, Chicago.

Suburban Equipment Company, New York City; $10,000; incorporators, Harrison Gray Otis, 2 Rector street; W. L. Otis, Charles A. Braker.

Ball Bearing Novelty Company, New York City; $6000; incorporators, A. B. Greenberg, 874 Longwood avenue, Bronx; Alfred Pioneer, Jacob Solomon.



Randolph Motor Truck Company of Delaware; $100,000; incorporator, I. B. Lipson, 105 West Monroe street, Chicago, Ill.

WITH THE MANUFACTURERS.

J. Murray Page, one of the popular men along San Francisco's automobile row, has been appointed manager of the factory branch which the Locomobile Company of America, Bridgeport, Conn., is to establish in Los Angeles, Cal.

C. B. Thomas, formerly with the Studebaker Corporation, has become identified with the Metzger Motor Car Company, Detroit, as special travelling representative. Frederick Wade, who was also with the Studebakers, has become purchasing agent of the Metzger company.

R. A. Weinhardt, formerly mechanical engineer of the

Digitized by Google

Hener Manufacturing Company, has joined the Continental Motor Company, Detroit.

The Jeffery-De Witt Company, Detroit, recently received an order for 1000 spark plugs from England.

The Cartercar Company, Pontiac, Mich., maker of Cartercars, is now running night and day in order to keep up with orders.

The Juno Motor Truck Company, Juneau, Wis., has been reorganized and new officers elected as follows: President, L. C. Pautsch; vice president, Theodore P. Hemmy; secretary, Henry A. Henning; sales manager, William McDougall.

The Olds Motor Works, Lansing, Mich., has leased a lot in Boston, at the corner of Commonwealth avenue and Cummington street, upon which will be erected a three-story building of reinforced concrete with a floor area of 26,000 square feet. It will be occupied by the Oldsmobile Company of Massachusetts, the New England representative of the Olds Motor Works, and will be operated as a sales and distributing house, with a complete service department in connection.

The Bower Roller Bearing Company, Detroit, is enlarging its plant considerably in order to take care of increased business. Contracts have been placed for new machinery and equipment to cost $50,000.

The Standard Roller Bearing Company, Philadelphia, recently installed new machines at a cost of over $100,000. This move was made necessary to take care of the rapidly increasing business of the company.

The Continental Engine Company of Chicago is to move its plant to Dallas City, Ill., across the river from Burlington Ia. The company is also to be reorganized, Charles Barry, formerly with the Deering Harvester Company, and T. C. Mars, formerly with the Model Gas Engine Works, joining the organization.

The Belvidere Screw & Machine Company, Belvidere, Ill., has increased its capital stock from $100,000 to $200,000, in order to provide for expansion. Contracts have been awarded which will more than double the present factory, which is now running day and night on spark plug and other automobile work. The output for this year will reach the million mark in plugs.

The Brooks Manufacturing Company, Saginaw, Mich., has succeeded to the delivery wagon business of the Duryea Auto Company and is now engaged in the manufacture of light delivery wagons under the Duryea patents. The passenger vehicle business has been taken over by the Duryea Motor Company of Saginaw, which is headed by Charles E. Duryea.

The Long Manufacturing Company, Detroit, Mich., has sold its plant to the Cadillac Motor Car Company and will build a new factory, 270 by 120 feet, on a site which it has bought. Double the floor space of the old factory will be afforded, and the output of the company's radiators will be increased materially.

The Resilio Tire Filling Company, Elmira, N. Y., has secured a plant at First and State streets, where it will manufacture a tire filling compound. George B. Wilcox has been secured as superintendent.

The Matheson Automobile Company has opened a temporary establishment in Philadelphia, at 203 North Broad street, in charge of B. M. Westerman. A permanent factory branch is to be established in that city.

The Eagle Company, Newark, N. J., has discontinued the manufacture of Standard Friction and X-L windshields, and sold its entire stock of those shields to Charles Weidman, New York City. This move was made because the factory space was needed for other manufacturing The company is to confine itself to the Eagle Rain-Vision shield

Hall's Garage, 131 Clinton street, Wausau, Wis., has taken the agency for Truffault-Hartford shock absorbers and other products made by the Hartford Suspension Company, Jersey City, N. J., and in keeping with the policy of the latter concern has established an attaching station in connection with the regular garage business. The building, which is devoted to the needs of automobile and motorcycle owners, is shown in an accompanying illustration.

The Goodyear Tire & Rubber Company, Akron, O., has completed the additions to its factory, which now presents the appearance depicted in an accompanying illustration. Two of the new structures were the administration building and garage. The entire plant has a floor space of 1,000,000 square feet and affords employment for 5000 persons. The business of the concern is handled by 66 direct factory branches in the United States and Canada, in each of which the service system is an important feature. In addition there are a large number of agencies, each of whom is given liberal support by the home office.

The Abbott Motor Company, Detroit, has purchased a plot of land along Beaufait avenue, to the north of the present factory, and is to erect new buildings which will enable a 25 per cent. increase in the output of the company during the coming year.

The Motz Tire & Rubber Company, Akron, O., has opened a branch in Cleveland, O., at 2352 Euclid avenue, in charge of C. R. Serfoss. This move was made necessary by the increasing business of the company in that locality, the Motz cushion tire proving quite popular with Cleveland motorists.

E. C. Howard has been appointed sales manager of the Cadillac Motor Car Company, Detroit, succeeding E. R. Benson, who resigned to join the Studebaker forces.

The Goodyear Tire & Rubber Company, Akron, O., reports that its 1911 sales exceeded the sales for 1910 by 500 per cent., tire equipment for 102,250 cars being produced. This year the company plans to make tires for 250,000 automobiles.

W. W. Farnsworth, formerly with the Motor Wagon Company of Detroit, and before that with the Federal Motor Truck Company in the same city, has joined the Flanders Manufacturing Company, being connected with the advertising department.

Hall's Garage, Hartford Suspension Service Station at Wausau, Wis.

The Cadillac Motor Car Company, Detroit, has secured John Calder, formerly with the Remington typewriter, who will assist in the organization and production work.

Frank Smith, first assistant to Paul Smith in the sales department of the Studebaker Corporation, has resigned and it is rumored that he will shortly join the Metzger Motor Car Company.

Pratt, Carter, Sigsbee & Co., Detroit, has been experimenting recently with a single-cylinder truck of 800 pounds capacity. The car has been put through many long runs, and is to be shortly manufactured in a large factory which has been leased.

J. G. Phipps and C. W. Whitson, Detroit, have brought out a new electric with a 107-inch wheelbase. It is stated that manufacturing operations are to be commenced shortly.

Wallace H. Robertson, brother of George H. Robertson, the well known racing driver, has joined the sales department of the Simplex Automobile Company, New-York City, maker of the Simplex.

The Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., announces the addition of a new department for the manufacture of dies, tools, special machinery, etc., for the purpose of making the numerous specialties produced by this company.

GARAGE AND DEALER.

Charles Doughman, Ottawa, Kan., has taken the local agency for Lion cars, made by the Lion Motor Car Company, Adrian, Mich., and will conduct a garage and salesrooms in addition to his hardware store.

Winegarten & Holmes has opened a new garage in the Carter block Jottingham, Ill.

The Shelton Garage, Ansonia, Conn., is now in the hands of J. N. Sinsabaugh, he having purchased the interest of Frank Alling, who has gone to New Haven to open a garage.

The Big Rapids Automobile Company, Big Rapids, Mich., is installing new machinery, including a drill press and a lathe. This will enable the concern to handle almost every class of automobile repair work.

The Texas Motor Car & Supply Company, Cuero, Tex., has bought the automobile business of Richter & Cook and is to move into the Knights of Pythias building, which is being fitted up especially for use by the company.

The Morgan Garage at I and Tuolumne streets, Fresno, Cal., was recently sold to A. J. Arnaudon of Mendota, for $45,000. It is a two-story brick building a little over a year old, and will be continued under the same management.

The Pan-American Motors Company, recently organized in San Francisco, Cal., to handle Michigan and Moon cars for the northern Pacific Coast, is to build a new structure at a cost of $300,000 at Golden Gate avenue and Hyde street. It is planned to make it one of the most modern and attractive in the city, the plans calling for what is remarkable in a city establishment—namely, a 20-foot lawn in front. The building will be of steel and concrete, thoroughly fireproof.

The Tire & Auto Service Company is the title of a new concern which is located at 1580 Woodward avenue, Detroit, just beyond the Grand boulevard. The company carries tires principally, but also handles a large line of accessories and supplies.

The Donaldsonville Garage Company, Donaldsonville, La., is erecting an addition to its garage to be utilized as a paint shop, 26 by 38 feet. It will be divided into two rooms, one an air tight and dust proof drying room.

The Dove Machine Company is a new concern in South Lawrence, Mass., occupying a $30,000 brick structure at the corner of Broadway and Groton street. The building is thoroughly equipped with all kinds of machine tools for automobile repair work, including a large power hammer.

The Richardson Tire Company, Hartford, Conn., recently moved into new quarters at 20 Ford street, in order to secure more room to accommodate its rapidly growing business. The firm makes a specialty of tire repairing and carries a full line of supplies.

The Mandel-Frisbee Auto Repair Company, Sioux City, Ia., has just opened a new garage at 312 Pearl street. An automobile livery is being conducted, and the establishment includes a repair shop and painting rooms.

The Maine Motor Car Company, Portland, Me., was recently organized to succeed the Maine Motor Carriage Company. Offices have been taken at 43 South street, where car sales will be handled until Nov. 1, when the garage and accessory department will be turned over to the new company, which has $50,000 capital.

The Five Points Auto Company, Fort Smith, Ark., recently opened for business at 913-15 North A street, with J. R. Braidwood and A. W. Chisholm in charge.

Lusted & King, San Diego, Cal., has leased the establishment at 1140 Second street known as the Modern Automobile Shop, and will continue it under the name of the Pioneer Auto Brokers. Second hand cars will be handled, and a repair shop conducted.

The Florida Appersen Sales Company, Jacksonville, Fla., has moved to 325 West Adams street, taking the quarters formerly occupied by the Miller Automobile Company and securing room for a larger display of cars.

The Hailey Auto Company, Hailey, Id., has been bought by Furcht & Thorp, who will conduct a repair shop and livery business.

The W. P. Barnhart Company, Washington, D. C., has leased the store at 1707 Fourteenth street, N. W., where the Everitt car will be handled after extensive alterations have been made.

Julian Howard, Jacksonville, Fla., has moved from his former location to 532 West Forsyth street.

The W. H. McIntyre Company, Auburn, Ind., has appointed a number of new agents who will handle the McIntyre line of motor trucks in their respective localities. The new agents follow: McIntyre Commercial Car Company, Hartford, Conn.; Mechaley Auto Company, Stamford, Conn; Shinkle, Richardson & Co., Huntington, Ind.; Fox Brothers, La Crosse, Wis.; McIntyre Auto Sales Company, Webster, N. Y.; Imperial Motor Car Company, Nashville, Tenn.; C. E. Swanson, Chicago, Ill.; Syracuse-McIntyre Company, Syracuse, N. Y.; Werick Brothers Motor Car Company, Buffalo, N. Y.; George R. Beeson, Connersville, Ind.; Kingman Plow Company, St. Louis, Mo.; Bradley, Merriam & Smith, Council Bluffs, Ia.; E. Wiley Hill, Butte, Mont,; McKee & Scott, Fresno and Bakersfield, Cal.; McIntyre Auto Sales Company, Albany, N. Y.; Standard Motor Truck Company, Boston, Mass.; D. F. Head, Ithaca, N. Y.; H. H. Maurer, New Berlin, Penn; Lovegrove & Co., Philadelphia, Penn; F. B. Austin, Little Falls, N. Y.; Banta Brothers, Peoria, Ill.; J. J. Aker, Schenectady, N. Y.; Owen M. Smith, South Whitley, Ind.; F. A. Burmeister, Memphis, Tenn.; Hartford City Auto Company, Hartford City, Ind; J. August Schmidt, Gloversville, N. Y.

The Wesco Supply Company, St. Louis, Mo., with branch houses in Birmingham, Ala., and Ft. Worth, Tex., has taken the agency for Hagstrom spark plugs and other products of Hagstrom Bros., Lindsborg, Kan.

Duquesne Garden, Pittsburg, Penn., one of the city's main amusement places, is to be remodelled into a garage which will be one of the largest in the country.

The R-C-H Corporation, Detroit, has signed agency contracts with the following: J. H. Reichhardt Company, Cornell, Ill.; Rudolph Dittmar, Masbach, Ill.; the Capitol Motor Car Company, Raleigh, N. C.; Crescent Garage, Riverside, Cal.; Clark's Garage, Pomona, Cal.; Alfred S. Donau, Tuscon, Ariz.; G. F. Wisegarver, Decatur, Ill.; Weir-Moore Motor Company, Monmouth, Ill.; Fred Fiene, Freeborn, Minn.

The King Motor Car Company, Detroit, has appointed new agents as follows: Coleman Cutchins, Richmond, Va.; Barton Ford Motor Company, Cedar Rapids, Ia., and S. J. Wise & Co., Boston, the last named, for New England. The King car is now being manufactured in a new factory which is being run night and day to fill orders.

The Auto Inn in Columbia City, Ind., at the corner of Van Buren and Washington streets, is now in the hands of Waterfall & Rumsyre, Ralph Widdifield having sold his interest in the firm to Adam Rumsyre.

L. J. Botts has opened a garage and salesroom in Red Oak, Ia., in the Stevens building, corner of Reed and Second streets.

Maurer & Miller, Freeport, Ill., has moved to 17 Stephenson street, where more room is afforded to handle the firm's line of Maxwell and Reo cars.

L. A. Dyson, conducting the Independent Auto Tire & Repair Shop at 106 East 17th street, Rock Island, Ill., has enlarged his establishment by the installation of a complete vulcanizing outfit.

The Fairmount Motors Company, Fairmount, Minn., is now occupying its new garage at Main and Second streets. The building is 110 by 52 feet, and will hold 65 cars.

The Chase Motor Truck Sales Company, Minneapolis, Minn., has opened a new salesroom at 1507 Hennepin avenue, in the automobile district.

The Queen City Garage, Cumberland, Md., is now in charge of W. S. Burger, who bought the interest of A. B. Cochrane. B. H. Bias is assisting Mr. Burger in conducting the business.

The Murray O'Neill Company, New Bedford, Mass., is now fully settled in its new garage at 497-501 County street. The building is well protected against fire, the boiler room being separated from the rest of the departments, while the gasoline room is divided from the brazing department by a concrete wall.

Robert Collins, formerly with the Motor Shop in Trenton, N. J., has opened an establishment at 210 West Hanover street, called the Hanover. A repair shop is conducted and supplies and accessories carried.

The Bruns Automobile Company, Brooklyn, N. Y., has opened a new garage at New York and Atlantic avenues. This is one of the most modern buildings in the city, being completely equipped for the work of a service department.

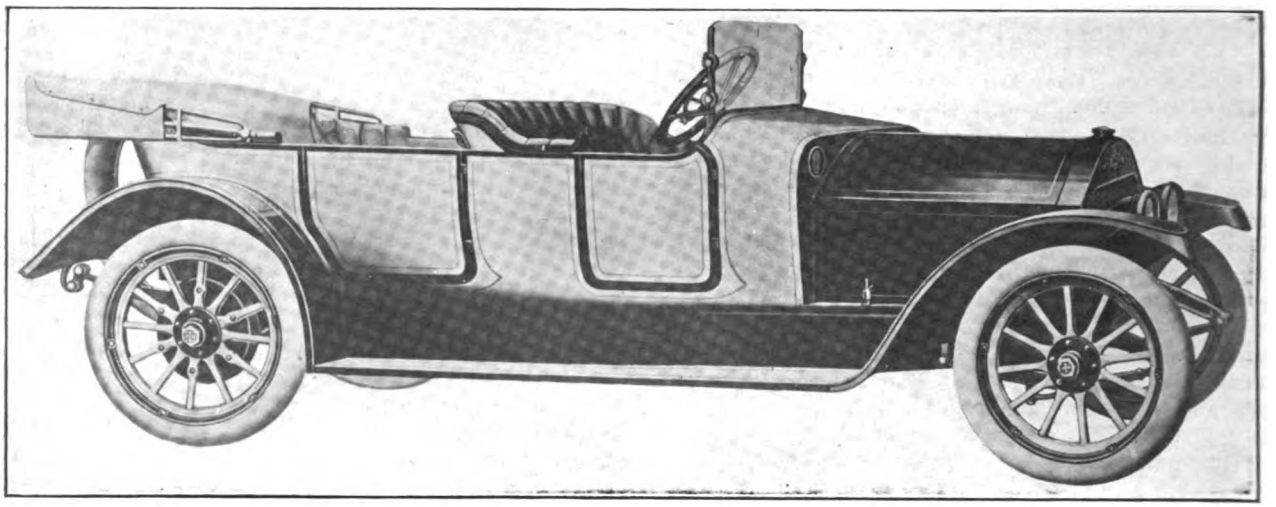
NEW HENDERSON CAR HAS NOVEL FEATURES.

THE advent of the Henderson car to the motor vehicle market of America has directed attention quite as much to the producer as to the product, a not unexpected result because of the association of practically all the members of the Henderson Motor Car Company with leading automobile manufacturers of the country. The organization is made up of men who have been prominent in producing and selling vehicles of known reputation, and have not only a knowledge of the demands of the people, but experience that well qualifies them for building cars that will be representative of the industry.

The Henderson Motor Car Company was created by men who carefully studied the market and the requirements of the motorists to determine what class of vehicle would meet a general demand. The investigation was to determine as a business proposition the conveyance that would in the largest measure satisfy the wants of those who now or may utilize motor cars. There were many factors to be considered in reaching a conclusion, chief of which was the design that would have every quality desirable and yet be within the limitations of the class whom it was decided would be the buyers of such machines.

The men composing the company were associated with other prosperous and busy enterprises, and to interest them it was necessary for the promoters to demonstrate as business men to business men that there was not only a need but a demand for a vehicle that would have every qualification for all-around service, and would be enduring and substantial when contrasted with machines of larger power and price. The personnel of the company was selected with a view of creating a progressive and efficient organization, that would be capable of demonstrating the worth of the cars and developing a market for them with reference to the entire country.

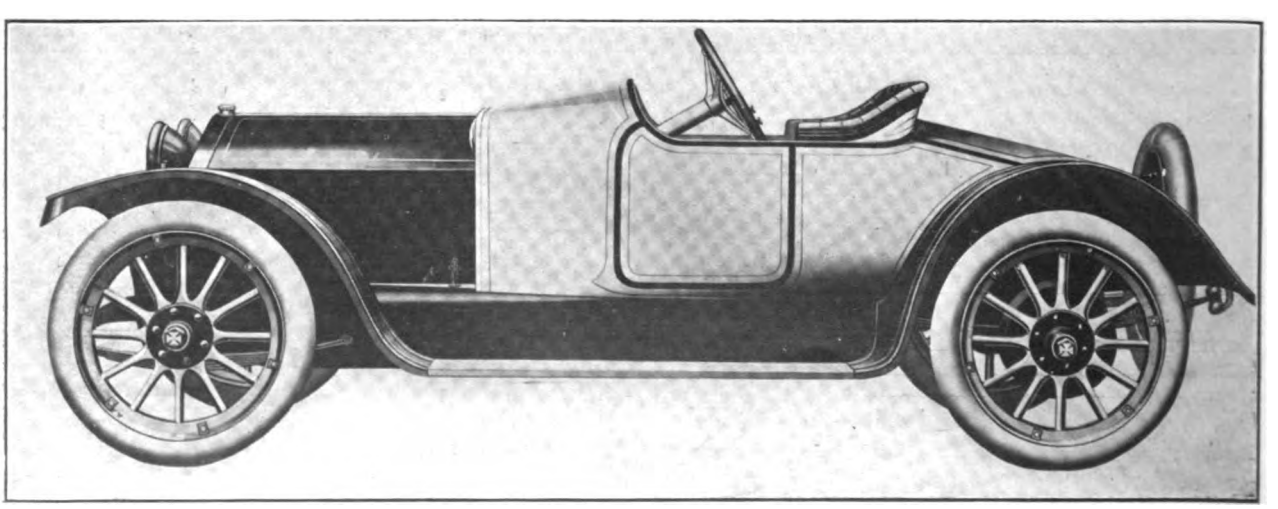


With a knowledge of the conditions for distribution and the necessity of a campaign that would effectively and successfully exploit the car, the company was developed with a view of directing the selling quite as carefully as it was proposed to construct the machines, and with the consummation of the project the Henderson Motor Car Company inaugurated its manufacturing and distributing with men of abundant experience at the head of each department and all in thorough harmony.

Mayor Shank Introducing and Christening the Henderson Car at Its Formal Public Appearance at Indianapolis.

The company is headed by L. Carter of Jessup, Ga., who has interest in many enterprises, and with him are associated R. P. Henderson, L. S. French, C. P. Henderson, C. K. Share, Chester S. Ricker and E. E. Rogers. The president is Mr. Carter, who was president of the Henderson Motor Sales Company. R. P. Henderson is vice president and general manager. He was associated with his brother in the Henderson Motor Sales Company and was for a considerable period of time sales manager of the Parry Manufacturing Company, one of the largest manufacturers of horse carriages in the Middle West. Mr. Henderson is one of the best known men in the automobile in-

Digitized by Google



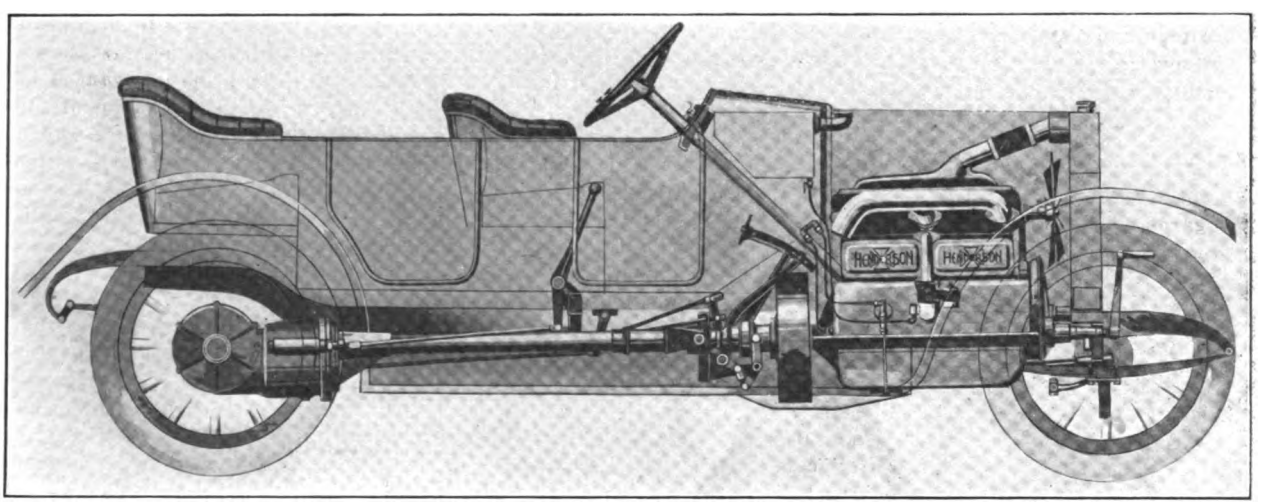
The Five-Passenger Touring Car Body Equipment, Known as Model 46, on Standard Henderson Chassis.

dustry, he having been for years in direct contact with those engaged in the distribution of carriages, and later with those selling motor vehicles. The secretary and director of advertising is Lucius S. French, whose experience in promotion and publicity work has been exceedingly broad, and who has a wide acquaintance throughout the country. He was advertising manager for the Henderson Motor Sales Company. The treasurer is C. K. Share, who was for a considerable length of time treasurer of the Willys-Overland Company and is regarded as one of the best of automobile factory accountants.

The directorate is Mr. Carter, R. P. Henderson, C. P. Henderson, director and sales manager of the Cole Motor Car Company; Chester S. Ricker and E. E. Rogers. The factory organization will be directed by R. P. Henderson, who will be assisted by Charles A. Trask as factory manager, by Chester S. Ricker as chief engineer, and by Fred E. Wilson as sales manager. Of these Mr. Trask was until recently director of one of the largest companies in the group constituting the General Motors Company, is chairman of the committee on papers of the Society of Automobile Engineers, and has by a recent visit to European automobile factories materially broadened his knowledge and become familiar with the most advanced of Continental practises. Mr. Ricker is a member of the Society of Automobile Engineers and a technical writer as well as an engine expert. Mr. Wilson was connected with the Marion Motor Car Company as sales manager and his knowledge of the trade throughout the country is exceedingly comprehensive.

The company has capital of $100,000 and it has leased the factory owned by the National Casket Company at North West and 14th streets, Indianapolis, Ind., for a term of years, this having been used for factory purposes by the company prior to this transaction. The property has an area of five acres and the buildings are three and four stories in height, with frontage of 212 feet in North West street and 106 feet

The Two-Passenger Roadster Body Equipment, Known as Model 44, on Standard Henderson Chassis.



Digitized by Google

in 14th street. They are adapted for manufacturing, being well lighted, ventilated and sanitary, and the transportation facilities for receiving and shipping are of the best. There are abundant possibilities for expansion and the capacity of the plant may be increased many times as the demands for cars shall necessitate greater facilities.

The initial Henderson car was formally seen in Indianapolis May 29, when it was presented to the public for the first time, the occasion being the day prior to the second annual international sweepstakes at the Speedway, which event had attracted to that city motorists from all over the country and abroad. So far as is known no automobile was ever introduced to the motoring world with similar formalities.

An automobile parade was inaugurated at University Park and this was made up of a police escort, a military band, and something more than 50 cars representing practically every automobile manufacturer in Indianapolis, as well as a number of representatives of other manufacturers. At the head of the line was the Henderson touring car that was receiving its official welcome, and in this was Mayor Shank and other dignitaries of the city. The cars were decorated with pennants bearing the name of the new car and badges were distributed to thousands, these representing a stork carrying the new Henderson car in its beak. The demonstration was formally concluded at Monument circle, where Mayor Shank made an address, in which he expressed his pleasure to welcome the first popular priced car to be made in Indianapolis, which, in the name of the municipality, he christened "Henderson." He then wrote the words "I Christen Thee Henderson" on the hood of the car with a mammoth pencil. The car, decorated with flowers, was then taken to the Claypool hotel and there displayed in the centre of the lobby until May 31, where it attracted no end of attention from the visitors.

The Henderson car is built as two models, 44 being the roadster and 46 the five-passenger touring car, the difference being in the body equipment, the same chassis serving for both types. The bodies differ broadly and yet they are so designed that the same qualities and the same characteristics appear in both. It should not be assumed that the chassis is in any way experimental. To the contrary it has been designed to principles well established and indorsed by sound engineering practise. That is to say, nothing has been accepted unless it is known that it will add to the endurance, service or appearance of the vehicle. The construction is in every way substantial, there being a large factor of safety in each detail, all of the wearing parts being of unusually large proportions and so designed that there may be ample compensation for wear. Extreme care has been taken to insure endurance of the machine and this has resulted in a design of harmony and balance throughout. The power is ample for all requirements and the vehicle has sufficient speed and accommodation to meet the approval of those who want a serviceable and practical car.

The "X-Ray" View of the Henderson Touring Body and Chassis, Showing Side Detail of the Power Plant and Driving System.

The chassis description will suffice for both models, but each body must be described separately.

The motor is a highly perfected construction of four cylinders, water-cooled, of the L head type, with the cylinders cast en bloc, this being a practise that has been very generally followed abroad and had found much favor with American designers. The motor block is cast of a high grade quality of gray iron and with the intake manifold integral, this simplifying the design and permitting an assembly that is claimed to have especial advantages. The block is formed with the head open so that there is full access to the water spaces, which are unusually large and free from obstructions. The water jackets may be thoroughly cleaned of the core and full insurance made against blow holes and similar imperfections.

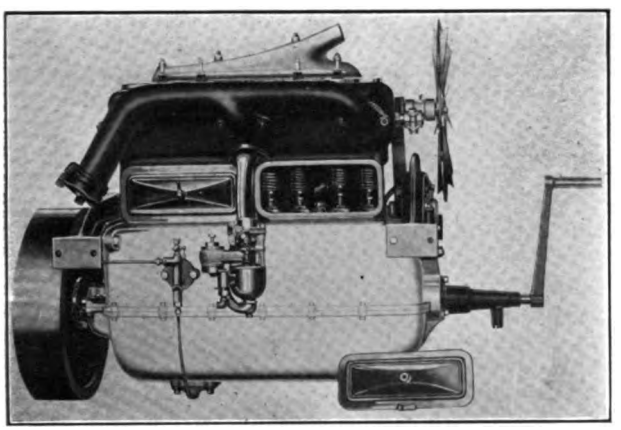
The engine block is bored, machined, then aged

Digitized by Google

and later reamed and ground to size, this process minimizing the possibilitity of damage from internal stresses. The cylinder bore is 4.125 inches and the stroke 5.250 inches, this giving a ratio of bore to stroke of one to 1.27, and by the standard formula of the Society of Automobile Engineers the rating is 27.2 horsepower. The engine will, however, develop 35 horsepower by conservative estimate. The pistons are of the same material as the cylinder block and after being turned to size are aged and carefully ground. These are channelled for four rings of the eccentric form, which are ground to exact fit on the edges and the outer periphery.

The crankcase is a two-piece casting of aluminum alloy, divided at the main engine bearings and the bottom of the lower section is formed by low webs into four compartments for the splash lubrication, while below this is the oil reservoir, a special pan or sump that is bolted to the bottom of the engine case and which may be readily removed should it be necessary to clean it. The forward end or web of the crankcase carries the end bearings, and the timing gears are covered by an aluminum housing or cover. In the division of the engine base the upper half carries the main engine bearings, which are three in number, both sections being strengthened by bridge work that insures against driving stresses.

The crankshaft is an alloy steel drop forging that is heat treated to show a tensile strength of 120,000 pounds to the square inch. It is formed with three main bearings, the rear being 2.125 inches diameter and four inches length, the centre being two inches diameter and 2.5 inches length, and the forward bearing 1.75 inches diameter and 3.125 inches length, this giving a total bearing surface length of 9.625 inches. The crankpins of the shaft have liberal diameter and unusual length. The entire construction is designed to endure much heavier service than it will ever be subjected to. The crankshaft is mounted in bearings of nickel bronze, for which great service and endurance is claimed. It is removable from the rear of the crankcase; not a difficult operation.



The Factory Buildings at North West and 14th Streets, Indianapolis, Ind., Leased for a Long Term by the Henderson Motor Car Company.

The connecting rods are of the same material as the crankshaft, a fine alloy steel, heat treated, and are drop forged I section. The bearings of big ends of the connecting rods are nickel bronze and are fitted with shims for adjustment, the caps being retained by bolts and nuts. The small ends are bushed with the same bearing metal, and the wristpins, of heavy tube, hardened and ground to size, are secured in the piston bosses by cap screws that project through them. There is no possibility of a wristpin becoming loose.

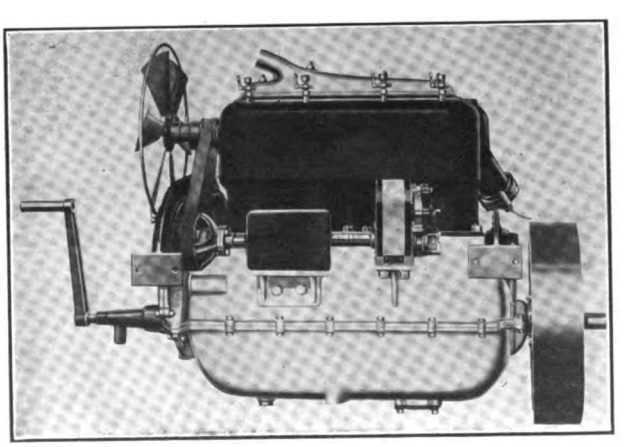
The camshaft is a drop forging of high quality al-

Digitized by Google

loy steel with the cams formed integral. This is heat treated and the cams and bearings are carefully cut and ground to size. This shaft is removable from the

Right Side of the Henderson Power Plant.

forward end of the engine case, and that it may endure under all side pressure leverage and that the bearings may not be subjected to abnormal service they are made unusually large. The front and centre bearings are two inches diameter and 1.25 and 1.5 inches length, respectively, and the rear bearing is one inch diameter and three inches length, there being a total bearing surface length of 5.75 inches. The camshaft bearings are of nickel bronze save the forward bearing, which has a bushing of phosphor bronze.



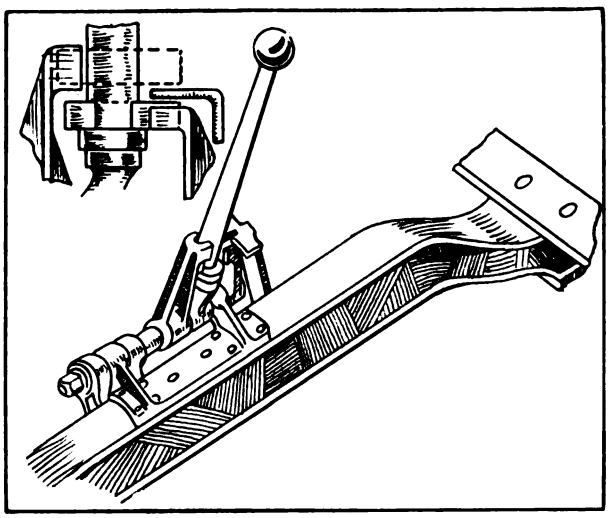
The valves are at the right side of the motor, with ports 2.125 inches diameter, the heads being cast iron with nickel steel stems, electrically welded. The valves have a clearance of .375 inch, this insuring a full charge of fuel being drawn into the cylinders and complete clearing of the products of combustion. The valve stems are operated in cast iron guides which may be replaced when worn. The valve tappets are of the mushroom pattern and are lifted by the hardened and accurately cut cams. The upper ends of the tappet rods are fitted with hardened adjusting screws and nuts to compensate for wear. The tappets operate in substantial guides bolted to the engine case. The valve stems, springs and tappets and the guides are enclosed in pockets formed by webs extending from the cylinder block and by plates that may be clamped into place instantly. This protects these moving parts from accumulations of abrasive substances and much prolongs the life of the mechanism.

The timing gears are of large diameter and wide face and are spiral cut to insure noiseless operation. The left gear drives the electric generator and magneto by an outside shaft, and the fan that supplements the radiation system.

The power plant is cooled by a thermo-syphon system of six gallons capacity, the water circulating through the large water spaces, entering the motor block at the base of the water chamber by a two-inch diameter inlet, and rising and passing out through a manifold with 2.5-inch diameter outlet to the upper portion of the radiator. The motor block head is covered with a large cast plate with which the outlet is integral, the plate being secured to the block by cap screws. The radiation is supplemented by a large fan carried on a bracket at the front of the motor block, the fan shaft being in a bearing that is adjustable by an eccentric to secure efficient belt tension.

The motor is lubricated by a supply of oil drawn from the reservoir beneath the engine case by a plunger pump operated by a bevel gear on the camshaft, and forced through a system of tubes and a sight feed on the toe board in the driver's compartment of the body to the three main bearings of the engine. The quantity of oil is automatically increased with engine speed and the motor bearings are always flooded, the overflow draining into the base of the crankcase and the casing that contains the timing gears. The timing gears are driven in a bath of oil, but the drainage of lubricant fills the pits beneath the big ends of the connecting rods, which sweep into them at every revolution. The splash lubricates the camshaft bearings, cams, tappets and tappet guides, the wristpin bearings, the cylinder and piston walls. As the oil accumulates in the pits it drains, after a constant level has been reached, to the reservoir, where it is filtered and again pumped through the system. The capacity of the oil reservoir is two gallons, a sufficient supply to drive for several hundred miles.

Carburetion is claimed to be a special quality with this engine, through a combination of conditions entering into the design. The inlet manifold is incorporated with the cylinder block and the form of this manifold, the fact that it is heated, and that there is but a very short "riser" attaching the carburetor to the motor, insures a uniformity of the carburetion. The carburetor is a float feed automatic type and it is fitted with a water jacket for heating in the event



Left Side of the Henderson Power Plant.

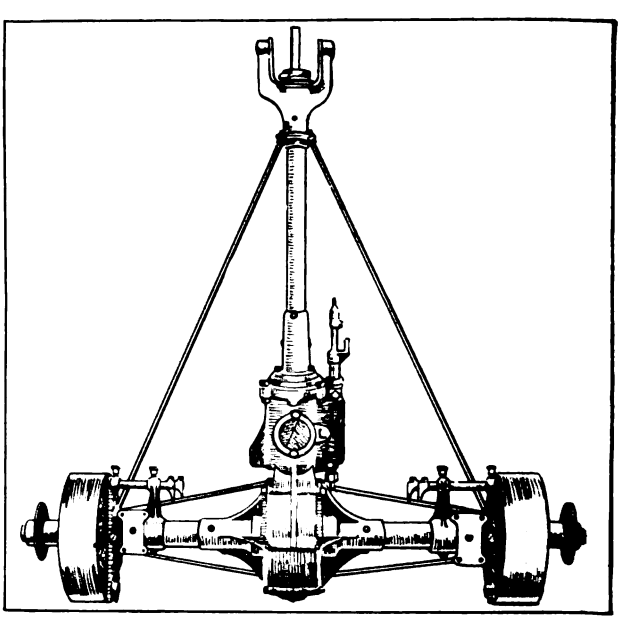
of cold temperatures, but this is seldom needed save at very low temperatures, because of the design of the manifold. The statement is made that the motor

Digitized by Google

is not only unusually productive in power, but is exceedingly flexible and dependable at all speeds, and that low gravity gasoline, now so frequently sold, can

Henderson Gear-Shifting System.

be used with excellent results.



The ignition is by a Remy low-tension magneto that is mounted on a bracket at the left side of the engine case and at the rear end of the outside camshaft, being connected with this shaft by a flexible coupling. The current created by this magneto is sent through a transformer coil mounted on the dash and thence returns to the distributor of the magneto, by which it is distributed to the spark plugs of the engine. This is the Remy system, familiar to many motorists. While this is the usual source of current supply it is supplemented by a storage battery that may be drawn upon for starting, or may be used as a spare.

It may be well, because of the relation of the ignition with the lighting of the car, to explain the method of lighting. This is by the Ward Leonard system, which is a standard equipment and is regarded as being in every way dependable. It consists of a small dynamo located on a bracket at the left side of the engine case that is driven from the outside camshaft. This current is carried to two storage batteries located under the seat of the driver, and from these the current is supplied to the lamps and to the magneto distributor in the event of starting or other need. That is, the generator supplies current for lighting and storage when the engine is running and battery supplies current for lighting when the engine is not running, there being automatic means for controlling the supply.

The battery is not charged until the engine is driven at a speed corresponding to 10 miles an hour, but after that it is charged so long as the motor is operated, an automatic electric switch interposing resistance in the dynamo field so that the battery cannot be overcharged or damaged. The variation of the charging current is practically between the speeds of 10 and 18 miles an hour of the car. The batteries need never be taken from the car and the only attention required is to add distilled water at monthly intervals to compensate for the evaporation of the electrolyte. One of the batteries is used exclusively for lighting and the other for ignition purposes. The lighting is controlled by a switch located on the dash and the driver may instantly light all of the lamps or any combination of them.

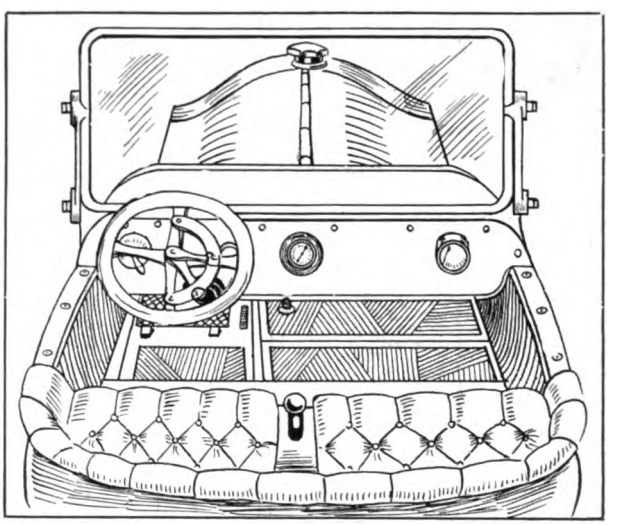
The engine need not be cranked as it is equipped with a Disco starter and it may be started as frequently as desired within the limitations of the Prest-O-Lite tank that supplies the gas for the initial explosions. The starter is operated from the seat of the driver.

The power plant is mounted in the chassis frame on heavy arms cast integral with the crankcase and it is suspended so low that there is practically no inclination of the driving shaft, this being a straight line when the car is under load. The clutch is of the cone design incorporated with the flywheel and the cone is 15.75 inches diameter, the face being 2.75 inches width and with an angle of 12.5 degrees. The cone is leather faced and it is actuated by a ball thrust collar that is moved by the conventional pedal. The clutch engages easily and it will not slip or "crab." The pressure is governed by a spring that may be adjusted to obtain any desired tension, merely by removing the universal joint at the rear of the clutch assembly. There is a toggle action interposed between the pedal and the thrust collar so that the foot of the operator is relieved of all clutch spring pressure after the pedal has been moved about two inches. This makes the operation of the clutch a very

Henderson Driving System, Transmission and Rear Axle.

easy process. Back of the clutch is a large universal joint that compensates for every possible distortion of the chassis frame from road stresses.

Digitized by Google



The coupling of the clutch shaft and the main driving shaft is ahead of the forward end of the heavy torsion tube. This tube carries at the forward end a large, wide yoke that is attached to a strong cross member of the chassis frame, and is secured by bolts so that the tube may move with the rise or fall of the rear axle without stresses upon the shaft. The torsion tube at the rear end is bolted to the transmission case, which is bolted to the strong steel shell of the rear axle housing, making a single assembly. This rear construction is the Stutz rear system and it is known as a three-quarter floating rear axle. The gearset is selective sliding type, giving three forward speeds and reverse, the gears and shafts being of selected metal, the gears having wide faces for endurance, and the shafts being mounted on annular ball bearings. The gears are of nickel steel and are so proportioned as to size and pitch that speed changing is easy and practically noiseless. The differential is of conventional design. The driving shaft and the axle shafts are carried on large roller bearings. The axle shafts are of nickel steel and are made with squared ends with conical collars just inside the squared ends that receive the wheel hubs. In the hubs are similarly tapered holes into which the shafts are fitted and are retained by nuts. The axle housing is heavy and the entire construction is very strong.

The chassis frame is a channel section with a width of four inches of pressed steeel, cambered at the front end to afford a wider wheel lock and raised 5.25 inches at the rear under the tonneau seat to permit the use of the springs. This is suspended on semi-elliptic springs 38 inches length and two inches width forward, and three-quarter elliptic springs 50 inches length and two inches width at the rear. The front axle is a drop forged steel I section 2.5 inches depth and 1.5 inches thickness. The steering knuckles are heavy and the wheel spindles are 1.5 inches diameter. The tiebar is behind the axle for protection against contact with road obstructions. The wheels are of wood, artillery type, and are fitted with demountable rims and 34 by four-inch tires. The wheelbase is 116 inches.

The control of the car is by a steering column of Gemmer make, fitted with a 17-inch wheel, the spark and throttle levers being mounted above the wheel on quadrants. The driver sits at the left side of the car and the left pedal actuates the clutch, the "pushing through" or continuation of movement of the pedal disengaging the clutch and applying the service brake. The right pedal, ratchet retained, operates the emergency brake.

The speeds are obtained by a single lever rising through the deck and operating in a slot between the cushions of the driver's seat. This lever terminates in a hard rubber globe. The movement is forward and back, and raising and lowering. Instead of the conventional H slot and the side-to-side movement through the gate, raising or lowering the lever performs this operation. The lift or drop is very small. The connection may be seen in the X-ray view. Lifting the ball an inch and moving it backward two inches meshes the low speed gears; pushing the lever forward, allowing it to drop and again pushing it forward gives the intermediate speed; then drawing it back gives direct drive; reverse is obtained by lifting the lever and then pushing it forward.

The brakes are both internal expanding, the shoes being within drums of 14 inches diameter bolted to the rear wheels. Both sets are operated through equalizers and they may be adjusted by raising the floorboards and turning turnbuckles that are locked with wing nuts. No tools are required for this adjustment. The fuel is carried in a tank of 14 gallons capacity located directly behind the dash and above the extension of the toeboard, being fed by gravity to the carburetor, the quantity being shown by a gauge. Especial care has been taken to insure proper lubrication of all wearing parts, grease cups being the usual means of protection.

Driver's Seat and Control of Henderson Cars.

The bodies are of the straight line torpedo type, with deep cowl and wide doors, the forward entrance being 18 inches width and the rear 20. They are of wood frames and sheet metal, with sightly lines and excellent finish. The upholstery is of high class leather with full spring seat and back cushions, these being comfortably tilted. The front seat is 41 inches wide with four inches between cushions, the rear 47 inches. The mudguards are wide and graceful, being stayed forward by the bar lamp bracket. The wide running board is shielded by an ample splash apron. The dash lamps are set into the dash, and the tail lamp and registration plate holder are arranged in combination with a tire carrier at the rear. The lamps are finished with nickel and black enamel, this being the finish of the hardware of the car.

The equipment of the car, besides what has been described, includes an extra demountable rim, jack, tire pump, tire tools and repair kit, the required tools and a bulb horn.

Digitized by Google

Is it consistent to worry for six months over what kind of a car to buy, and then settle the oil question in six seconds or less?

Good oil makes your engine give you your money's worth. Bad oil ruins it sooner or later.

PANHARD OIL

Panhard Oil, the perfect lubricant, is the result of 35 years of experience and experiment.

It is refined from the best oil in the world —Pennsylvania Crude. You get more mileage to the gallon from Panhard because of its heavy lubricating body. It is filtered just enough to draw off all free carbon. It will not carbonize, unless fed too freely.

Every dealer who knows the wisdom of handling the best, sells Panhard Oil—in gallon and half-gallon checkerboard cans or bulk. If yours doesn't, let us know. We'll see that you are supplied. Send for the Booklet "Motor Lubrication."

It tells fully about the proper lubrication and care of your engine. Sent in return for your dealer's name.

300 Cubic Inch

MERCER

Wins Third Place

IN

500-Mile Indianapolis Race

In Field of 24 Starters

Time—6 hours, 34 minutes, 56 seconds. Average speed —75.96 miles per hour. Bettered last year's winner's time by 7 minutes, 12 seconds.

Only One Mercer Car Was Entered. This Car Had Smallest Piston Displacement of Any Car in Race.

The car finishing first had 1 1-2 times the Mercer's piston displacement. The car finishing second had twice the Mercer's piston displacement.

Such facts speak volumes for Mercer efficiency, durability and economy of operation. The Mercer's victory over some of the greatest speed creations of the world is convincing evidence of its desirability for everyday use.

As a prospective buyer, does such wonderful performance appeal to you? Every Mercer car has the same "make good" qualities built into it that made possible the Indianapolis showing.

NEWTONE

The Mile Away Electric

MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS---A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

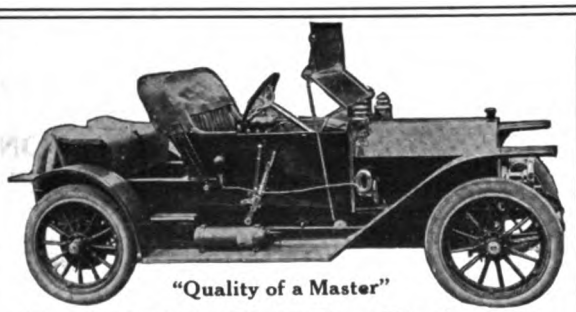
From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**



Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

MAC-KAE

UNIVERSAL TERMINAL

The Mac-Kae Universal Terminal fits *any* type of plug, either foreign or domestic.

Turn the threaded fibre sleeve and the jaws are firmly closed and simply *cannot work loose.*

By fully extending the jaws, this terminal will give secure contact on a plug through the top cap, if by accident the threaded post should be broken off.

You can remove the Mac-Kae Universal Terminal while the motor is running.

25c each at all dealers, or direct from us.

THE STURDY STUTZ

Not simply a good car, but as good as the best.

The Stutz car is built strong—where strength means additional value and service. The Stutz car is built simple—because simplicity means ease of operation and masterful construction. Complexity signifies superfluous weight and imperfect engineering ideas. The Stutz car is built of the best materials in every part—because each part must be an efficiency asset if you want real service from your car.

The Stutz car is known as "the car that made good in a day" because all of the above claims are true.

GASOLENE GALLON GAUGE

For Automobiles and Motor Boats.

For measuring the amount of gasolene in supply tanks.

The numbered markers are slideable and may be adjusted to show the number of gallons in any given tank whether it is square, round, oval or irregular in shape.

The depth of each gallon is the same in square sided tanks.

In round or oval tanks the depth of the gallons will be less towards the middle of the tank.

The outside level marker shown is to register the amount in the tank at any given time.

Handsomely finished in black stained wood, 15 inches long, with 20 brass markers.

If your tank holds more than 20 gallons, extra markers will be inserted as ordered.

Price 50 cents postpaid anywhere in the United States.

Send Express or Postoffice money order. Stamps accepted.

SPECIAL.

Extra long gauges made to order for very deep tanks; not more than 24 inches in length, with markers numbered from 1 to 30 as may be required.

Price 75 cents, postpaid anywhere in the United States.

"Always There"

SPLITDORF IGNITION vindicated its claim to SUPERIORITY once more in the fastest 500-mile race that has ever been run---the 500-mile Memorial Day grind at Indianapolis.

Joe Dawson's winning SPLITDORF EQUIPPED National at an average speed of 78.72 miles per hour, demonstrated the wonderful firing qualities of SPLITDORF IGNITION at their best as worlds of verbal argument could not do.

The BIGGEST and FASTEST race of its kind in the world fell as a fitting laurel into the all-conquering and convincing SPLITDORF sweep.

Merz' Stutz finishing fourth, Endicott's Schacht finishing fifth, Zengel's Stutz finishing sixth and Wilcox's National finishing ninth were also SPLITDORF EQUIPPED---rounding out 50 per cent PRIZE WINNERS for SPLITDORF IGNITION.

Can the qualities of SPLITDORF IGNITION be doubted in the face of such a commanding demonstration?

SPLITDORF IGNITION "delivers the goods." The headiest and most successful race drivers demand it---they know its constant, hot, fat firing qualities at any and every speed---they know it is reliable and that its use PRECLUDES IGNITION TROUBLES.

JUST INSIST UPON TRYING IT---we will gladly shoulder all responsibilities for changes and adjustment and GUARANTEE SATISFACTION.

Write for our "Racing Record."

Pittsburg **New York** **Newark**

Distributors in Boston, Hartford and Springfield

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

The Jeweled Auto-Meter Built With Even More Care Than a Watch

This is necessary, as more is expected of a Warner than a watch. It must actually *do* more than a watch. It must be more sensitive and yet be able to stand hour after hour and year after year of jolting vibration.

Every Warner is a *jeweled* instrument. Each is tested time and time again before it goes to grace the dash of your car—to be the most looked-at as well as the most *responsible* part of your car. Therefore, we can make the guarantee and feel safe in making it, for the Warner is trouble-proof.

Dial Illumination

Two tiny electric lights underneath bezel, which concentrate rays on clock face and upon speed and distance figures; no light escaping to blind the eyes.

Speed Indicating Scale

Circular aluminum dial mounted on standard ship-chronometer pivot. Hairspring returns disc to zero when speed stops. Total weight 106 grains. Figures can be plainly read by the average eye 10 feet away.

Bezel

Made of heavy seamless brass tubing, accurately machined. Spun around thick French plate glass, which cannot become loose and rattling. Absolutely dust-proof, water-proof and oil-proof. These are, of course, exclusive Warner features.

Total Distance Indicator

Odometer registers to 100,000 miles before it automatically resets. The season odometer runs independently of trip odometer.

Trip Indicator

Trip odometer registers to 1,000 miles and automatically resets to zero. Another reset turns up any desired mileage on trip odometer, thus you may pick up and follow a route book, beginning at any point and have trip mileage absolutely agree with route book.

Warner Unbreakable Flexible Shaft

Driving shaft troubles and annoyances entirely wiped out by this new, unbreakable casing. Made from high-carbon spring steel wire of great tensile strength. Heavy outer wire coiled over smaller inner wire into perfect oil-tight flexible casing; highest grade of vanadium steel used for inside driving chain. Heavily plated with either brass or nickel.

Warner Instrument Co., Beloit, Wis.

Main Offices and Factory: 1286 Wheeler Avenue

BRANCH HOUSES maintained at Atlanta, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Denver, Detroit, Indianapolis, Kansas City, Los Angeles, New York, Philadelpnia, Pittsburg, Portland, Ore.; San Francisco, Seattle, St. Louis. **Canadian Branch,** 559 Yonge Street, Toronto, Ontario.

The Warner can be secured through reputable automobile dealers in any city or town in the United States.

Model M2—$125

Other Models $50 to $145

WARNER AUTO-METER

(180)

NOTE TO DEALERS: When suggesting a speed indicator always recommend the Quality Warner *first*. Then if you finally have to sell something inferior because of price, your customer can't blame you for his dissatisfaction—he refused the Warner against your judgment.

NOTICE

Shock Absorber Patent Again Sustained
Foster Shock Absorber Enjoined

ON May 4, 1912, the District Court for the Southern District of New York again affirmed the validity of the Truffault Patent, and held that the FOSTER SHOCK ABSORBER was an infringement, and issued an injunction restraining its further manufacture, sale and use. Thus another infringer of our rights has been disposed of.

We take this opportunity of repeating our former warning that we shall prosecute vigorously all infringements now on the market or any which may spring up in the future.

VOL. XXXIII. No. 10

AUTOMOBILE JOURNAL

$1.00 the Year.
10 Cents the Copy.

PAWTUCKET. R. I.

June 25, 1912

The hills show how well your lubricant suits your car.

WITH the wrong oil your motor must overcome both the hill and the faulty lubrication.

You will find that the correct oil carries you much more easily over the hills at high speed. On heavy roads the correct oil will yield more power, and give freedom from pounding and overheated motors.

Different types of motor demand different grades of oil. By a thorough analysis of various cars, we have prepared a complete lubricating schedule. It gives the grade of oil that will yield the greatest power from your motor. It will be sent you on request.

In power-engineering circles these recommendations from us would be accepted as authoritative. You may feel assured that, in quality, the oils specified on the chart set a world standard.

They are put up in barrels, half-barrels, and in 5 and 1 gallon sealed, white cans.

The oils (refined and filtered to remove free carbon) are named:

Gargoyle Mobiloil "A."
Gargoyle Mobiloil "B."
Gargoyle Mobiloil "D."
Gargoyle Mobiloil "E."
Gargoyle Mobiloil "Arctic."

All are branded with the Gargoyle, which is our mark of manufacture.

Mobiloil

A grade for each type of motor.

If oil saves power, it follows that one oil saves more power than another.

VACUUM OIL COMPANY, Rochester, U. S. A.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

No Car Can Equal KisselKar Comfort Without Equaling the Wheel Base

"Thirty" H. P. $1500

EXTRA liberal wheel base permits the generously deep seats and unusually roomy tonneaus. These give an emphatically upper-class character and rare riding comfort to the KisselKar. With the liberal wheel base bridging the inequalities of the road, the big wheels, big tires, shock absorbers and deep seat upholstering absorbing road vibration, the KisselKar has an easy riding comfort which is approached by only a few American cars.

Light on its feet in picking the road, responsive of control, heavy enough to hold the road well, but light enough in proportion to its power to be lively and spirited, the KisselKar brings a special quality to the pleasure of automobiling.

And, as another special advantage that comes to the KisselKar owner, is KisselKar service. The KisselKar service organization, maintained by the manufacturer, with service centers at principal points in America, extends the completest service to every owner of a KisselKar, minimizing running cost, retarding depreciation, and adding to the fullest motoring enjoyment.

KISSELKAR

"Thirty" $1500 "Forty" $1850 "Fifty" $2350 60 h. p. "Six" $3000

TEXACO MOTOR OIL

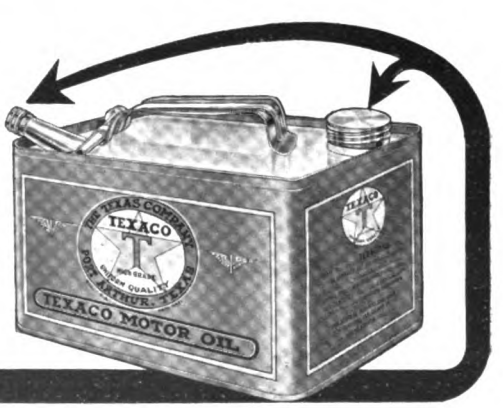
The Can with the Inner-seal

FOR your protection, and for ours, Texaco Motor Oil is sold in a can with an inner-seal. Just under the screw caps of the vent and the spout are stretched paper-thin pieces of white metal. Your knife will cut them as if they were cheese. But they mean much to you, the car owner, and to us, the refiners.

To you they mean that when you buy Texaco Motor Oil in cans you get exactly what you ask for and pay for—an oil that has proven its quality, that is free from carbon impurities, that shows a zero test, that lubricates perfectly and *increases* the efficiency of your motor.

To us they mean that the oil on which we have staked our reputation as refiners reaches your hands in the same condition in which it leaves ours. Under such conditions Texaco Motor oil speaks for itself with sufficient eloquence.

For sale in one and five gallon cans at most good garages and supply houses. Colors of the can—green with red star. Every can furnished with long, detachable spout that makes pouring easy.



We have published a booklet, "About Motor Lubrication," that every car owner should read. For your copy address, Dept. F. 7 West St., New York City.

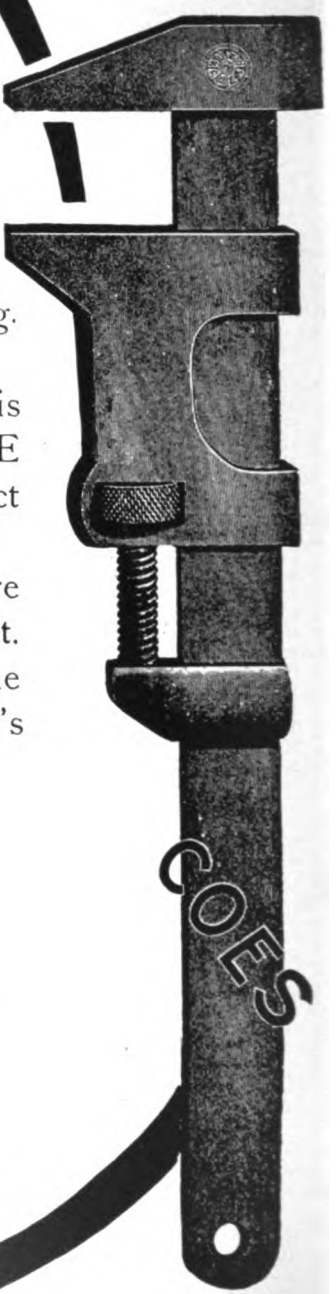
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

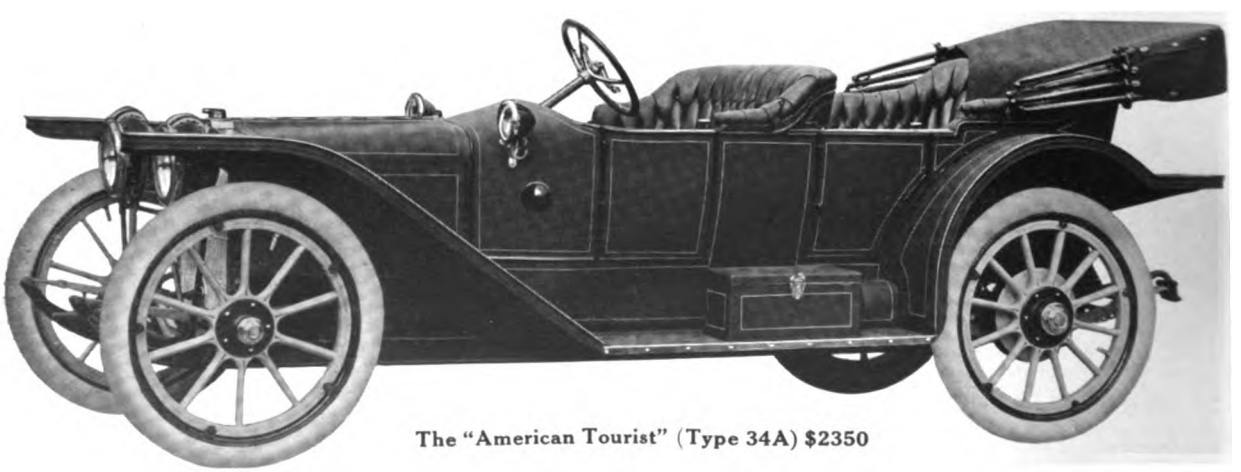
1913 AMERICAN UNDERSLUNG

NET SALES GAIN 211 PER CENT.
For Last Ten Months ***over corresponding period of previous years.***

This Most Modern Car

FOR the season of 1913 we announce our three famous standard models: the "American Traveler," at $4500; the "American Tourist," $2350; the "American Scout," $1475, *all fully equipped.*



No manufacturers of high grade motor cars in the country can boast the increased demands which have come in recent months to the makers of the "American Underslung." They are the accumulated sales of eight years of education on the part of the pioneer manufacturers of the most modern principle of all in automobiles. ***The increase in sales of the "American Underslung" during the last ten months was 211 per cent. greater than in the ten corresponding months of a year ago.***

The superiority of the last word in motor car design is now not only conceded, but demanded by the habit-freed public. It was once looked upon as an experiment which should make good; now a car without it appears old style---antiquated. It is the safe, practical, graceful and stylish car the veteran motorist demands.

The "American Underslung" differs in constructive principle. The frame---the very backbone of the car---is slung under the axles instead of being placed over the axles, and the result is that the very drawbacks of the conventional overhead car are completely eliminated.

The low center of gravity means *safety* and added comfort.

American Motors Company
INDIANAPOLIS, INDIANA

The "American Tourist" (Type 34A) $2350

Four passengers. Wheel base 118 inch, tires, 37x4 inch, front and rear on Q. D. demountable rims.
$2350 includes regular equipment as follows: electric light dynamo outfit complete with generator and storage battery supplying five lamps; $50 Warner speedometer; fine plate-glass wind shield; Disco self-starter; fine mohair top and curtains; high tension magneto and storage battery; one extra rim; shock absorber; robe rail; foot rest; horn; jack; tools and tire repair outfit.

Digitized by Google

NOT SILENT---but, "a noise so faint that one can scarce distinguish it from silence."

AMERICAN UNDERSLUNG 1913

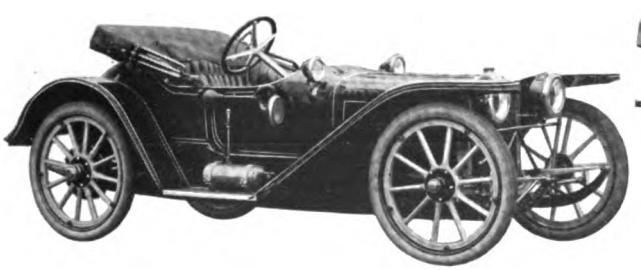
Establishes Sales Record

The straight line drive means *less wasted power.*

The larger wheels mean easier riding, tire economy and *maximum road clearance.*

The underslung frame permits the *direct* and *practical* introduction of all these distinct advantages.

And on top of these guaranteed practical advantages, you have the most superbly and gracefully designed, and most handsomely finished car made. These big, strong, powerful cars are beauties. They are just as fine as we can make them. The exquisite body work is magnificent. Every "American Underslung" is as carefully made as a special job.

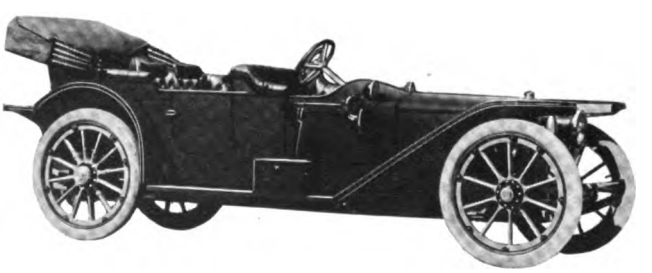


This year we have equipped the "American Underslung" with the finest accessories made. It is all in keeping with the elegance of the splendid new models. Nothing has been too good for us to secure and all is made regular equipment---not as extras. "American Underslungs" are known as fully equipped cars.

Our complete 1913 line can be seen in all of the principal cities. We began deliveries on Types 34A and 22A on June 17, and on Type 56A July 3.

Write us for a handsome 1913 catalogue and a simple treatise on the "Advantages of Underslung Construction."

American Motors Company



INDIANAPOLIS, INDIANA

The "American Scout" (Type 22A) $1475

Strictly a 2-passenger car. Wheel base 105-inch; tires 36x3 1-2 inch; front and rear on Q. D. demountable rims.

$1475 includes regular equipment as follows: $50 Warner speedometer; fine plate-glass wind shield; Disco self-starter; electric dash and tail light supplied by a large storage battery; gas head lights supplied by Prest-O-Lite gas tank; fine mohair top and curtains; high tension magneto and storage battery with coil; one extra rim; combination circular tire holder and luggage box; horn, jack, tools and tire repair outfit.

The "American Traveler" (Type 56A) $4500

Six passengers. Wheel base 140 inches; tires, 41x4 1-2 inch, front and rear on demountable rims. Springs—front, 40-inch; rear, 54-inch

$4500 includes regular equipment as follows: combination electric lighting dynamo and self-starter, all five lamps electric; $50 Warner clock combination 100 mile speedometer; fine plate-glass wind shield; fine mohair top and curtains; high tension magneto and storage battery; two extra rims; shock absorbers; foot rest; robe rail; horn, jack, tools and tire repair outfit.

4400 Miles With HARRIS

TRADE MARK REG. U.S. PAT. OFF.

OILS

Before it became necessary to clean the soot-deposits from the motor.

We print herewith an excerpt from a commendatory letter from a user of HARRIS OILS. This is the most forceful evidence we can produce regarding the unusual efficiency of HARRIS OILS.

OTTUMWA AUTO COMPANY

Ottumwa, Iowa,
Dec. 22, 1911.

A. W. Harris Oil Co.,
Providence, R. I.

Gentlemen:—

"We have averaged fully 3000 miles on Ford cars to one cleaning out of the carbon, this we believe you will readily agree with us, is so far **beyond any results obtained by any ordinary oil on the market** that there could not even be a comparison. We have had Fords go as high as 4400 miles before it was necessary to clean out the carbon and the condition of the motor at the time of cleaning the car was easily good for another 1000 miles and then would have been in even better shape than it would have been possible at 800 miles use with common oil."

Yours very truly,
OTTUMWA AUTO CO.
Per H. J. Lytle.

We are constantly receiving letters of this character. HARRIS OIL users seem more than pleased to tell us about the quality of our product. We have just published a handsome folio containing 42 fac-simile letters from users of HARRIS OILS. Why not send for it? Get the evidence of the men who buy and use HARRIS OILS—after all, that is the supreme test.

A. W. HARRIS OIL CO., 326 S. Water St., PROVIDENCE, R. I.

143 No. Wabash Ave., CHICAGO, ILL.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

	"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA" 2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
3½-in. Auto Clock.....	28 00	30.00	45.00	Only made in
3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—**Add $3.00 to above Price Lists.** (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

Stutz $2000 car defeated the highest priced cars made at home or abroad

"THE CAR THAT MADE GOOD IN A DAY"

At the Indianapolis Speedway Decoration Day the Stutz had three entries.

It was one of the smallest cars in the Five Hundred Mile race. Merz, who finished fourth, averaged more than seventy-six miles an hour for the full 500 miles. Len Zengel averaged seventy-three miles an hour and won sixth place in a Stutz. Gil Anderson averaged over 80.88 miles an hour for 200 miles, when he went off the track on account of a blown tire.

Considering the fact that the Stutz sells for $2000 and has defeated the highest priced cars made at home and abroad, the showing made at Indianapolis is one of the marvels of motordom.

Last year at Santa Monica the STUTZ won third place—at Fairmount second place—and in the Bakersfield road race the STUTZ won first place, one hour and twenty minutes ahead of its nearest competitor. In this year's races at Santa Monica the STUTZ cars finished fourth and fifth---ahead of all American cars.

Write today for the "Story of the Sturdy Stutz."

The STUTZ has no equal at the price---$2000. It is the mechanical equal of any car selling at any price.

Our booklet, "The Story of the Stutz," tells you all about the STUTZ advantages---the 120 inch wheel base, 4 3-4x5 1-2 motor with large valves that will develop fully 50 h. p., the Stutz rear system---and many other strong points that will appeal to you at once.

At least investigate---write today for free booklet.

A New Stewart Speedometer with Grade Indicator from the World's Greatest Speedometer Factories

No Finer Speedometer Ever Built

Model B $50
Model B-1 $85
(Clock Combination)

FACTS AND FEATURES

This instrument operates on the magnetic principle. A perfectly balanced dial cup is positioned in jewel bearings in the field of a *permanent* magnet and is acted on by the Foucault or eddy currents from a permanent magnet when the latter is rotated. As is well known, this torque or pull on the cup is directly proportional to the speed at which the magnet is rotated. The indicating figures are cut directly on the dial. (*We are owners of the early patent on speedometer with rotating dial.*)

This New Instrument Differs from Other Magnetic Speedometers

First, and of vital importance, is the improved magnet (*developed by Stewart engineers*)—the magnet in the form of a *closed ring*. Every engineer and electrician will appreciate this real improvement. A continuous metallic path for the flux is thus assured that insures *absolute permanence*. A *keeper*, as it were, is *constantly* provided. In fact, the keeper is an *integral part* of the magnet itself.

This ideal form of magnet permits of entirely dispensing with the field plate, or field ring, heretofore used, thus greatly simplifying the mechanism and permitting greatly increased space in the case, thus accommodating a liberally proportioned temperature compensator.

This temperature compensator is an exceedingly simple arrangement of a bi-metallic coil that, responsive to temperature changes, actuates a quadrant arm carrying the spring. The action is direct and positive; having virtually no resistance to overcome, no load to lift or sustain, the action is dependable.

Temperature Compensators and Grade Indicators Are Exclusive Features of Stewart Speedometers

The grade indicator is an integral part of the instrument. The dial, actuated by a unique mechanism, indicates exactly the grade that the car may be ascending or descending at any time. A valuable feature, and one greatly appreciated by automobile factory engineers, who see in it great possibilities for a more rational use of speed change levers on their cars.

A New Odometer of the Highest Grade

Large size number wheels driven by a train of large coarse-pitched, actuating gears, no springs. The simplest, highest cost and highest grade odometer ever used in this class of instrument.

The Equipment

Stewart Speedometers are fitted with the strongest flexible shaft. This we believe everybody concedes. We have been for more than 20 years the largest makers of flexible shafting in the world. The swivel joint, *first used on Stewart Speedometers*, and now widely copied, is another detail on which we spend more money than others.

Our swivel joint is made of hardened steel forgings (not castings), unbreakable, and will outlast the car to which it is attached.

***The forged swivel joint is an exclusive feature of Stewart Speedometers.* We have spent during the past year over $100,000 providing buildings and machinery for producing *this one item* of speedometer equipment, that we might be enabled to make a high grade, unbreakable drop forged steel joint at a cost that would not prohibit using them even on our lower priced instruments.**

The world's greatest authorities on magnets and magnetism have approved of this new system. We will furnish to those interested reports of tests made by technological experts showing the marvelous accuracy of these instruments.

Clock Combinations

We point to improvements and features that can be purchased only in combination with Stewart Speedometers. We use a Seth Thomas clock, rim wind and rim set. Stop for a minute and think what this means. To wind it, you merely turn the rim of the clock—no key to hunt for; no taking off the bezel each time you wish to wind or set it. To set the clock, you merely pull out and turn the same rim—no unsightly knobs to destroy the beauty of the clock or openings in the case—sure to permit the entrance of water and dust—liable to put the clock out of commission.

Our experience with other makes of clocks used on speedometers has proven that Seth Thomas clocks are the best for the purpose.

Factories

Stewart Speedometers are made in the largest speedometer factories in the world. The buildings were designed and built for the purpose; they are of the highest grade construction, completely protected from fire by automatic sprinklers and other devices. The factories cover an entire city block and have a total floor space of about four acres. Nearly 600 expert workmen, exclusive of a factory office force of 60, and a shipping room force of 50, are employed. We pay the highest wages and salaries. Machine equipment is the finest obtainable, the automatic screw machine department comprising over 60 machines. From the ponderous double acting presses, used for drawing up the case or shell, to the finest jewel lathes, every piece of machinery is the most suitable for the purpose that money will purchase.

Service Stations

The Stewart & Clark Manufacturing Company operate a chain of service stations extending from Boston to San Francisco, as well as in London, Paris, Australia, Africa and New Zealand. Stewart Speedometers are not put on the car and ignored. They are guaranteed for five years, and with service stations all over the world it is possible for car owners whose cars are equipped with Stewart Speedometers, to get unequaled service.

Product

It is the aim of the management to make Stewart Speedometers the finest that money will produce.

The Choice of Most Car Manufacturers

The factory engineers of 108 automobile factories have investigated Stewart Speedometers and approved of them as standard or special equipment on their 1912 cars. Equipment contracts for 1913 cars are being placed with us in such numbers as to indicate that most cars using speedometers will be Stewart equipped, contracts won in competition with all other makers—won on the merit of the instrument.

The most accurate speedometer ever produced

The Passing Of The Gas Lamp

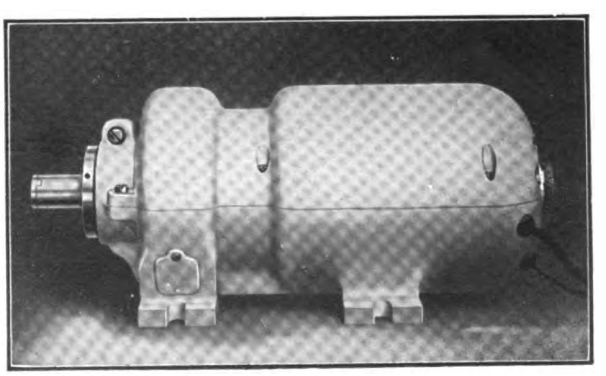
Even the very moderate-priced cars are now electrically equipped.

Gas lamps served their purpose admirably before the coming of the GRAY & DAVIS Dynamo.

All motor car lighting improvements have had their inception in the GRAY & DAVIS factories.

It was only natural that the big step forward in automobile illumination should also be a GRAY & DAVIS product.

GRAY & DAVIS



DYNAMO and ELECTRIC LAMPS

Stand today pre-eminent among automobile lighting systems. The fact that a car carries GRAY & DAVIS equipment is more than an indication of quality.

It proves beyond question that the manufacturer has honestly endeavored to build into his car the best the market affords—regardless of price.

GRAY & DAVIS products are sweeping the field. Manufacturers, dealers and owners now seek GRAY & DAVIS equipment.

Tell your dealer that "ordinary" lighting systems won't do. Insist upon GRAY & DAVIS Lighting Dynamo and Electric Lamps.

GRAY & DAVIS, Inc.

Manufacturers of Automobile Lamps

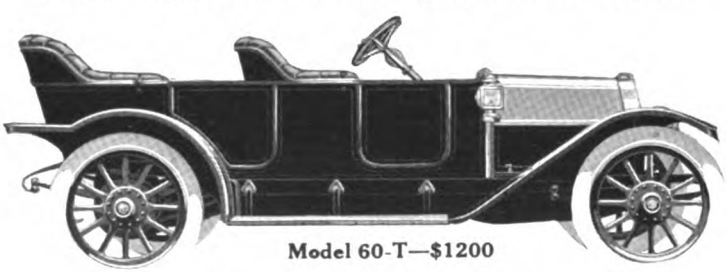
Overland

PRICE is the piovtal point in any automobile transaction. A man expects quality although his better sense may tell him he is taking a long chance at the price.

Our Model 60 Overland sells at $1200.



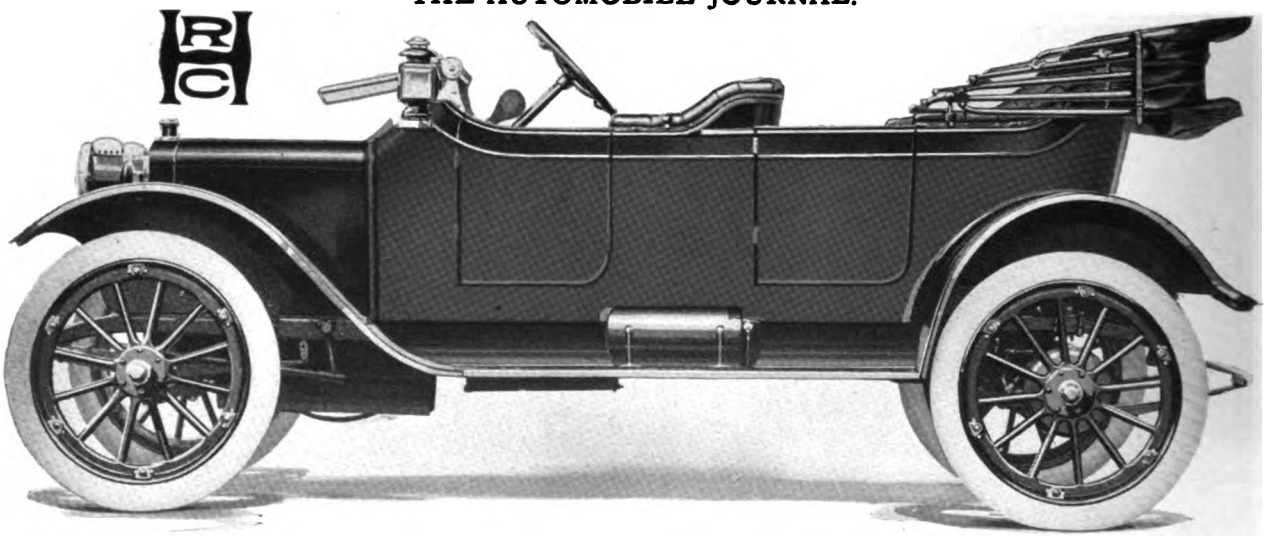
We want to thoroughly imbue you with the confidence that this Model 60 is sold at a lower figure than any other similar car, but not at a price which jeopardizes the value—a price which might make quality—a doubtful proposition.

Only a duplicate of the Overland factory could produce a car at $1200 of similar capacity, power, silence, speed and comfort. The Overland plants have no duplicate in size or efficiency.

Model 60 is the car you should investigate. It will prevent you paying $1500 for the same value.

Write for book K-46.

The Willys-Overland Company, Toledo, Ohio



Model 60-T—$1200

Wheel base, 111 inches; body, 5-passenger fore-door touring; motor, 4⅛ x 4½; horsepower, 35; Remy magneto; tires, 34 x 4 inch Q. D.; equipment, three oil lamps in black and brass finish, two gas lamps, horn and generator. Self-Starter, $20 extra.

Model EE—5 Passenger Touring Car—110 Inch Wheelbase

R-C-H

"Twenty-Five"

TOURING CAR—Model EE

$900 F. O. B. DETROIT

32 x 3½ tires, demountable rims, extra rim, Bosch magneto, gas tank, windshield, lamps, horn, tools and kit; and the famous Jiffy curtains, adjusted in an instant, making the car entirely weather proof. Long stroke motor, three speeds, enclosed valves.

STANDARD MODEL

$850 F. O. B. DETROIT

Top, windshield, generator, Jiffy curtains, 5 lamps, horn, tools and tire repair kit, long stroke motor, three speeds, enclosed valves, Bosch magneto.

ROADSTER—Model EE

$750 F. O. B. DETROIT

Specifications and equipment same as Model EE Touring Car except that wheelbase is 86 inches.

STANDARD MODEL

$700 F. O. B. DETROIT

Specifications and equipment same as Standard Model Touring Car, except that wheelbase is 86 inches. The Roadsters are roomy, comfortable and exceptionally easy to handle in narrow roads.

General R-C-H Specifications

Motor—4 cylinders, cast en bloc - 3 1-4 inch bore, 5-inch stroke. Two-bearing crank shaft. Timing gears and valves enclosed. Three-point suspension. **Drive—Left-side.** Irreversible worm gear, 16-inch wheel. **Control—Center lever** operated through H plate, integral with universal joint housing just below. **Springs**—Front, semi-elliptic; rear, full elliptic and mounted on swivel seats. **Frame**—Pressed steel channel. **Axles**—Front, I-Beam, drop-forged; rear, semi-floating type. **Body**—English type, extra wide seats. **Wheelbase**—110 inches. Full equipment quoted above.

IN a recent 3000-mile trip through the Middle West, the writer met and talked with a number of automobile dealers, selling all makes of cars.

One of them—handling a car priced at well over a thousand dollars—made an illuminating remark. Said he: "I'm tired of explaining to people why my car is as good as the R-C-H—let alone better. I don't wish your man here any hard luck; but if he moves away or has a fortune left him, you can bet that next year I'll be in a position where the other fellow will have to do the apologizing."

Our increased output for the coming season will enable us to make dealership arrangements with a number of additional dealers on "the greatest car for the greatest number."

And when you're handling the R-C-H, your sales work consists in showing the car, not in apologies or explanations. Suppose you write us and see if we can't get together.

THE AUTOMOBILE JOURNAL

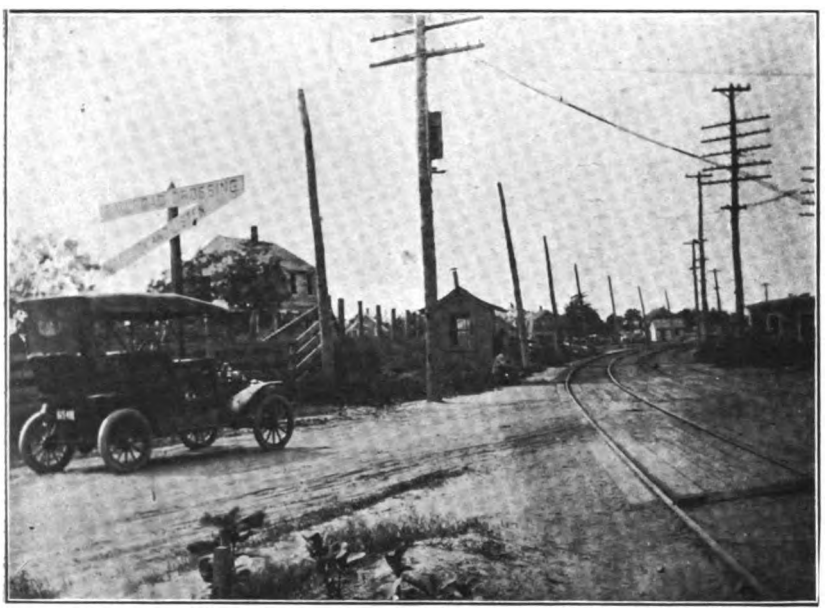
VOL. XXXIII, No. 10 JUNE 25, 1912 Price $1.00 the Year

DANGERS THAT MENACE ROAD TRAFFIC.

Unguarded Railroad Crossings, Fast Highway Trolleys, Obstructed Vision and Lack of Signals Threaten Public Travel---Need of Better Guide Boards.

HIGHWAY traffic today demands a control and regulation that does not now obtain. This supervision is necessary for proper protection of the people, as to property and life. But it is equally imperative to protect the traffic against dangers that constantly exist and which are quite beyond the jurisdiction of the authorities that can regulate the travel by street and road of vehicle and pedestrian. This is not meant to reflect upon any particular class and it is not specifically directed, but it is intended to bring to the attention of those who have real interest conditions demanding such change and remedy that so far as is practical there will be proper safeguards provided and a definite policy for the future adopted.

No. 1—Typical Electric Road Grade Crossing, the Approach of Cars from Left Obstructed by Bank, Shanty and Poles.



It may be maintained that there is sufficient law, and that the statutes are in a measure, at least, satisfactory. That may be so from one point of view, but the requirements of today are entirely different as contrasted from those of a decade ago, and with a knowledge based on experience the present is not too early to bring about what will, even were all agreed, require years of time and much patient and thankless endeavor by those who have the welfare of the public in mind.

Innumerable dangers constantly menace those who travel by highway vehicle, and these are increasing each day. No one can justly point to individual responsibility for this condition. That there is a lack of the protection that should obtain is due to the fact that the public has been willing to tolerate what all are aware is dangerous and must eventually result in loss of life and destruction of property, because it becomes accustomed to and accepts as a matter of course what

Digitized by Google

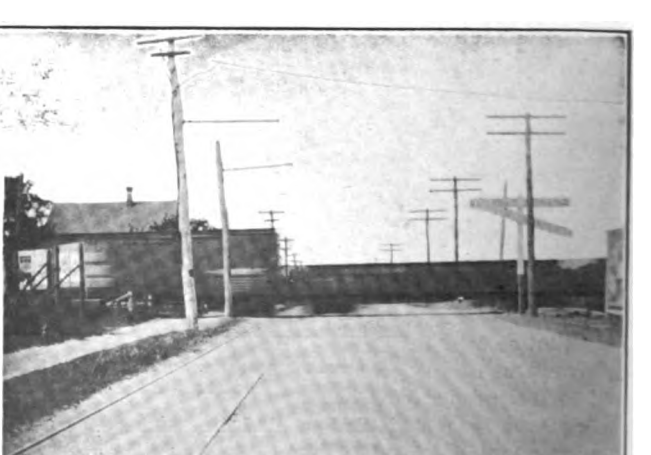
never should have been permitted to exist.

In one sense, and perhaps that is the better ground from which to present the case, the people are all

No. 2—Sharp Curve Approaching the Crossing, Showing the Danger Not Apparent to the Car Seen in No. 1.

negligent and have contributed to conditions that have become intolerable because of the probabilities of fatalities and financial loss. As those from whom reasonable protection is expected are public service corporations it can be pointed out that it is not reasonable to expect that proper safeguards can always be denied, and it is also well to believe that with the attitude of the people toward such associations the cost of litigation and damages that may be required would probably more than equal the initial cost and the maintenance of a satisfactory protection.

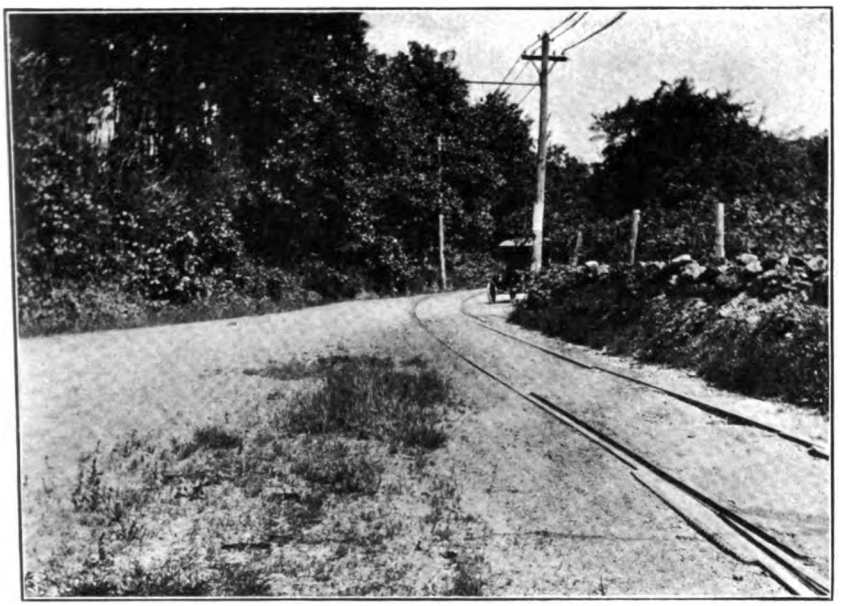
Without question the better form of control would be universal laws, so far as the different states of the nation are concerned. It is in every way practical to enact measures that would serve all states equally well. There need not be the complicated legislation that exists in some of the commonwealths, but what is wanted is a common sense law that would apply everywhere and would be understood by all. State statutes sound reasonable when applied by the politician, but it should be remembered that there are 48 different laws, and not even a legal expert can advise of them all. This being so it would be much better if there were one law for all the people and the politicians were to advocate such legislation because of the actual benefit to the public.



While it might not be possible to secure the enactment of a single regulation it is well within the range of possibilities to secure the passage of a law that would be uniform. The reasons why this should be are many. To illustrate:

Highway traffic has increased immeasurably during the past decade. The public is aware of the extremely large number of motor vehicles in use, but is not informed of the ratio of increase of service wagons during this period. There is another factor that is entirely lost sight of—that the mobility of the automobile and the mileage it can cover in a given time decidedly increases the traffic. That is to say, that the mileage of a specified number of motor cars would be perhaps five times that of a similar number of animal vehicles, and if measured by the miles travelled the number would be surprisingly large.

The really heavy traffic of pleasure vehicles is during the late spring, summer and autumn, but there is not the same variance in volume of service wagons,



No. 3—Grade Crossing with All Views of Approach from Either Side Shut Off by Buildings and Billboards.

No. 4—The Train Passing the Crossing Shows to What Extent a Vehicle Driver Can See Approaching Trains.

Digitized by Google

No. 5—Where a Bank and Trees Cut Off Sight of a Trolley Car That May Suddenly Appear on the Wrong Side of the Road and Then Cross It.

although there is decidedly more haulage during the months when the use of conveyances for recreation and pleasure is promoted largely by weather conditions. It is not possible to demonstrate the maximum and minimum of traffic in any single highway, but even casual observation will establish the facts to one's satisfaction.

The vehicular travel has been surprisingly increased in the principal or trunk roads. These highways have been the most improved and traffic has been diverted to them from roads not as well surfaced. But it is also patent that travel has also been turned to ways that were formerly used but little, these being the avenues to and from suburban and country residences, and summer colonies.

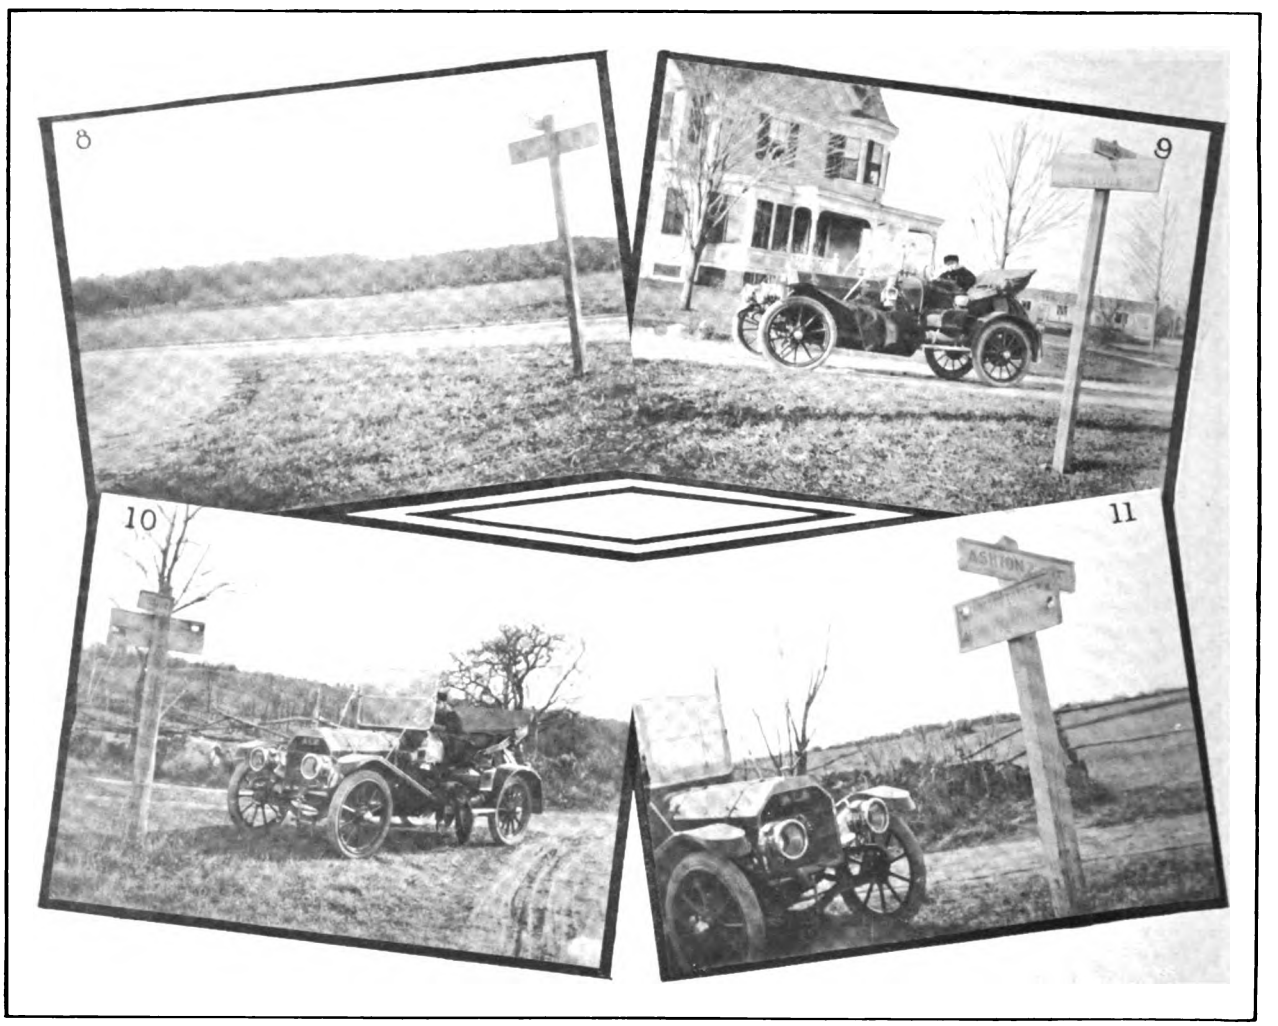
During the decade referred to there has been very large increase in steam and electric railroad traffic. Not only has there been much new trackage but cars and trains are operated more frequently. Suburban railroads have been wonderfully developed and with the main lines the trains are more frequent and are run faster. Where tracks cross highways at grade the speed of express and local trains, and their frequency with a larger road travel, has multiplied the dangers to an extent little realized. Most of the roads of this character are on private rights of way and that the cars and trains are operated at high speeds no one will deny.

The railroads afford some degree of protection where the public has made a demand that could not be denied, but it must be admitted that this is not always adequate, while it may be justly maintained that as a rule the means are both inefficient and insufficient. This view may not be taken by the railroad official, and yet no fair man will justify what is unquestionably dangerous. There is a burden of responsibility placed upon the owner and driver of road traffic that is shirked by those who manage and control the railroads.

There are state laws that require signs at railroad crossings that are assumed to be sufficient warning. Such signs are visible during the day, but not during the night. Taken the year through there is practically half the time when such signals cannot be seen. There are other crossings where gates are raised or lowered during the day by watchmen. At night these are not attended. Another class of crossings are prac-

No. 6—City Grade Crossing Where a Gate May Be Held Up to Allow Traffic to Pass After Warning Has Been Given.

No. 7—Motor Car Stalled on the Crossing Track and the Gates Down, Indicating That a Train Is Coming and the Car "Trapped."



Digitized by Google

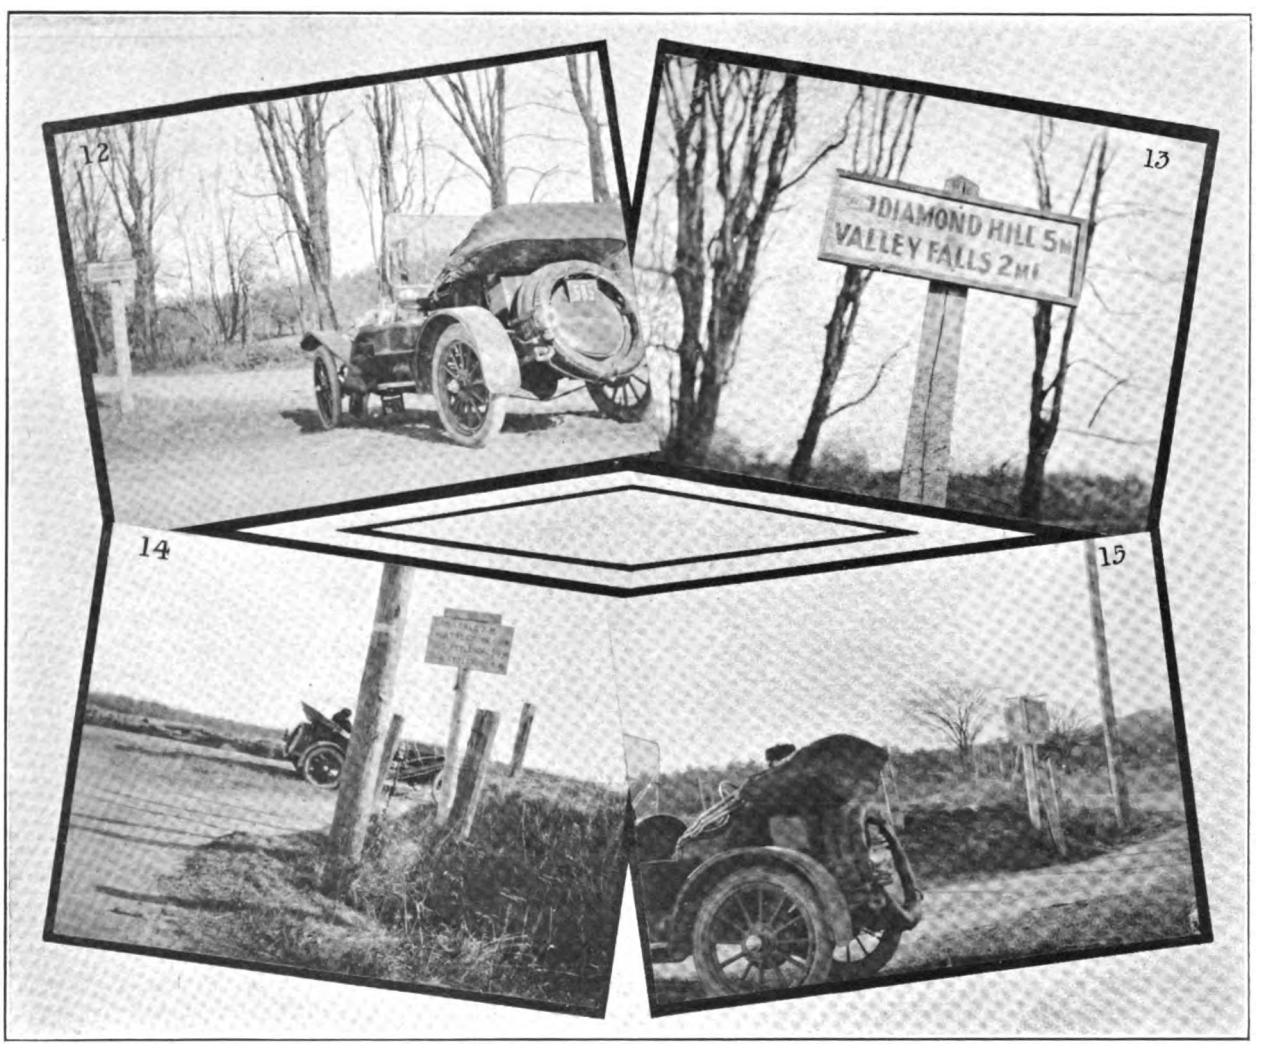
tically unattended. There are, to be sure, in the cities and towns, gates and watchmen on duty day and night, but these are a comparatively small proportion of the number.

The assumption is that on approaching a crossing with a railroad the driver of a road vehicle shall stop, look and listen. The theory is that the driver of the locomotive or the electric car shall make a warning signal that will be sufficient to allow those on the track or crossing to pass to safety. It is not possible to indicate when a train or car may be expected to reach a crossing, so that the highway traveller must always stop, look and listen, or suffer the consequences that follow.

But assuming that all of the instructions of the visible-by-day-and-invisible-by-night plan are followed, there are factors that would seem to place some of the burden upon the corporation. For instance, in the event that a stop is made and listening does not reveal the approach of a train or a car, the road traveller may be expected to go ahead. Should sight and hearing not indicate the proximity of danger the driver may proceed. In other words the sight and hearing of the public is expected to be its protection, and the sign is a notice to employ these senses.

This being so then the public ought to have the necessary means to protect itself, and this demands a change of conditions that will permit such safeguarding beyond a question of doubt. By this is meant that at these crossings, if nothing else is to be done, there should be such changes made that there will be both visual and aural signals. The reasons for two forms of warning is the possibility of one failing. There should be required of each train or car such whistle or bell sound that there could be no confusion, to be made such a distance from the crossing that it could be heard in ample time. There should be another form of signal that could be seen, such as a

Signs Meant for One-Way Traffic: No. 8, Inscription on Both Boards on But One Side; No. 9, How the Directions Can and Cannot Be Read; No. 10, Guide Board Can Only Serve When Traveller Alights; No. 11, Equally Inconvenient When Approached from the Second Direction.



Digitized by Google

semaphore arm falling and rising, or a lamp lighted and extinguished, in the absence of more certain warning.

Practically all railroads employ a block system wherever it is considered necessary. By this a signal is shown at either end of a block indicating to the trains approaching that there is a train or a car within the block, and prohibiting entrance to the block so long as the signal is displayed. These are generally electric installations that are automatic in their operation, can be maintained at comparatively little expense, and are dependable and reliable. There is apparently no good reason why such systems could not be adapted to guard the highway traffic and the railroad as well. In the event of this being impracticable it is possible to install automatic bell signals that can be sounded while a train is approaching for any desired distance, and operative at all times. It is also entirely practical to utilize a light such as is employed in the block system, which shall be lighted when the car or train is within a specified distance and extinguished when the crossing has been passed.

In any event automatic signals can be regarded as being sufficient to afford a reasonable protection, and while the initial cost of these might be objected to by the corporations, there is no argument that the maintenance expense would be large, and further than this with the increase of both highway and track traffic it is apparent that there would be no expectation of the installation of more costly methods, unless there were unusual and unexpected development. There is no desire to restrict the speed of the trains and the cars but with faster time and more frequent operation the demand would seemingly be for greater care and better supervision.

There is little disposition manifested by the cor-

Where Travellers' Conveniences Cause Inconveniences: No. 12, Single Sign, Admirably Placed, Refers to But One Way; No. 13, Only One Side of the Board Utilized, and Both Are Equally Valuable; No. 14, Elaborate Directions Given for a Cross Road and Main Highway Neglected; No. 15, Must Drive the Car Past Road to Read the Sign.

Digitized by Google

porations to protect the public unless the people unquestionably require it. This makes necessary that a provision be incorporated in the law authorizing the official of jurisdiction to determine what form of signal may be best adapted to the condition dealt with—not the installation of what is cheapest and will protect the railroad against damage suits. There should be no temporizing tolerated. The principal difficulty will be, as it always has been, to secure the action of officials vested with discretionary power in the proper enforcement of law, especially when decision means more or less initial expense for the railroad corporation. No public service enterprise is desperately striving to incur expenditure for protecting the people. It is seldom that such concerns will spend money unless compelled to do so. While antagonism is not openly manifested it can be affirmed as a matter of general principle that the policy that "a crossing unprotected helps pay dividends" is always approved by railroad officials.

No. 16—One of the Principal Thoroughfares of the State with a Direction Board Placed by a Car Manufacturer and an Insignificant Cross Road Splendidly Posted.

But while what has been stated may be applied to both steam and electric railroads it is obvious that there is quite as much danger from the cars of the electric roads that are operated on private rights of way, because they are operated with great speed and usually cross highways at grade. Such crossings are more frequent nearer the commercial centres and there is decidedly a larger volume of traffic. Not only this, the approaches are often obscured by trees, brush, buildings, bill boards, banks and other obstructions to vision, to say nothing of curves. Attention is directed to a specific condition in illustration No. 1. This shows a car stopped within 15 feet of a crossing of a high speed electric railroad where two roads converge, another way paralleling the track at the right. There is a slight grade on which the car approached the crossing. At the left the railroad makes a sharp curve and the view is shut off by the bank, the flagman's shanty and the telephone poles. At the right there is a view of the track for a short distance. Approaching from the other direction on the road at the right the curve is obscured by the house and embankment at the fork, and on the road at the left the shrubbery and the building prevent sight of the railroad. In illustration No. 2, which was made from beside the track, the curve and the character of the obstructions may be plainly seen. When the car was stopping the flagman waved his flag, which would be understood as a signal for the driver to proceed, and in a few seconds a ponderous electric car rushed around the turn at high speed.

It will be noted that there is a familiar railroad crossing warning, and a flagman, who can be seen seated on the steps of the shanty in illustration No. 2, but for all that it was in all probability the making of the picture that prevented an accident on this particular occasion, for the waving of a white flag could not be understood by the motorist as meaning anything else than safety for himself. Many have had narrow escapes from accident at this crossing.

Illustrations No. 3 and 4 direct attention to another crossing of a much travelled highway and a railroad with a private right of way. There are days when at least a thousand motor cars pass this crossing, to say nothing of considerable haulage by heavy vehicles and horse carts and wagons. Illustration No. 3 shows that the single track has the customary warning signs, between which the track extends across the street. Approaching from the opposite direction there is a curve by which car may turn to or from the track in the road, and there is nothing to indicate the turning of these cars, nor is there warning of the approach in the main track. The view of the track across the highway is shut off at the right by an enormous billboard, and at the left by a high growth of bushes and trees, and a billboard, so that a car cannot be seen until it is so close that it could be avoided only by a miracle. The approach from the opposite direction in the road gives no better view of the track because of the billboard at the left and the houses at the right. The real condition can be judged from illustration No. 4, which shows a freight train moving over the crossing and the actual distance the track can be seen beyond the street lines.

While these conditions are shown by day it should be understood that they are much more menacing at

Digitized by Google

night when there is neither lights nor flagmen, no signals of any kind that can be distinguished by the eye, and the cars are operated with very irregular headway, because they convey people to and from a large place of amusement and until late in the evening. The possibility of accident from a car turning from the highway into the private right of way track may be judged from the fact that suburban cars are always equipped with high power headlights, and every motorist knows the speed at which a light is approaching cannot be judged with accuracy. The possibilities of a large car swinging across the highway directly in the path of an automobile, with the headlight burning, might also be confusing.

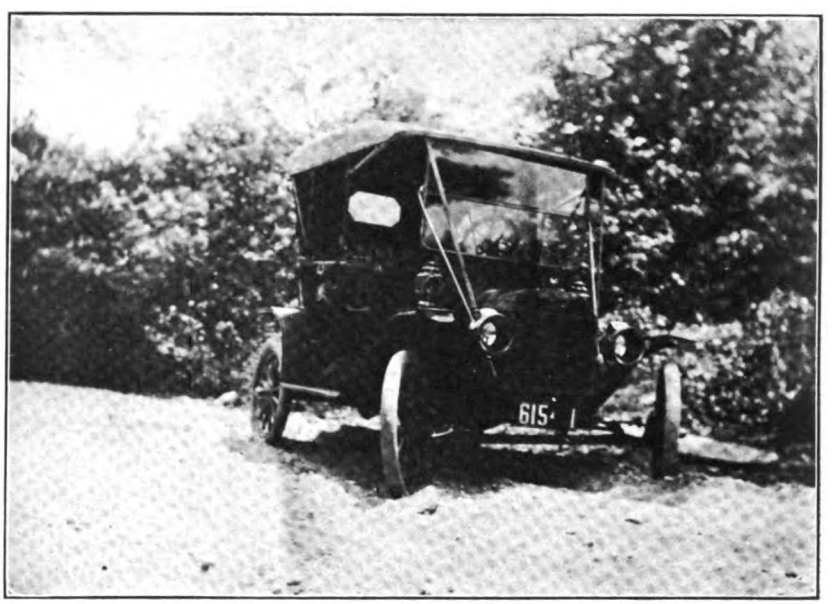


Illustration No. 5 shows where a high speed highway trolley track crosses a road after making a "short cut" at a turn, and nothing can be seen of the electric car until one is within a few feet of the track—so close in fact that there is unusual danger unless one is aware of the conditions and drives extremely carefully. Yet there is no protection whatever afforded the public at this place.

Illustration No. 6 shows a railroad crossing at grade in a city where no less than 125 trains pass in either direction daily, and this, it will be noted, is protected by gates that are lowered at an automatic signal given when the trains are at least a quarter-mile distant, and probably a minute in advance of the time of arrival, but these gates do not fall simultaneously and it is possible for a vehicle to be on the track with one gate down and the other partly lowered. This picture shows a car being driven over the crossing with the nearest gate lifted for it to pass, and illustration No. 7 shows the car stalled on the crossing with both gates down. While such an incident is unusual it is not impossible for a vehicle to be practically trapped and the machine and driver in great danger because of the gate keeper permitting the traffic at the crossing to pass after the signal for the gates to be lowered has been given.

The conditions illustrated cannot be controlled by city or town laws or ordinances. These must be dealt with by statutory provisions, which ought to be so specific that there can be no possibility of evasion.

State laws, as a rule, make provision as to the manner of locating and maintenance of direction boards, which are especially necessary for those who are driving through sections of the country that are unfamiliar. The towns are usually required to erect posts and reasonable signs at points where roads diverge and converge, at intersections and wherever a traveller might be uncertain of direction, these to indicate the distance to one or more villages, towns or cities, with a hand or arrow specifying the way to take to reach the places named. These signs are serviceable by day if well painted and lettered, but exposed to the weather they must be given every care to serve a useful purpose. Unless reasonably conspicuous they cannot be found at night unless one is familiar with the way—in which event they are seldom needed—and are utterly useless. Besides this they are seldom so placed that they can be read without alighting from a vehicle, especially if there be more than one sign on the same post.

These signboards are occasionally erected for advertising purposes, in which case they are not dependable and not often well located. Sometimes some of the automobile clubs have established directions along well travelled routes, and occasionally a cross road is well posted while a main highway is neglected. There is no objection to signs being placed as frequently as people desire, but whatever is intended for information for the public should be in every way dependable.

No. 17—An Example of Municipal Road Repairing—Loose Gravel Heaped 15 Inches Deep in a Road for Vehicles to Consolidate, Making the Way Almost Impassable.

The main reason why the roads are so poorly provided with signs is the lack of proper supervision. The matter is left to different towns and cities and to officials who are negligent or derelict in their duties, and so long as there is no actual revolt by the people conditions are not remedied. System ought to be applied first of all and each road should have whatever directions should appear to be required by the traffic. It is not to be expected that the traveller can depend upon casual or indifferent statements. There should be authority with every sign, and in addition to the

Digitized by Google

facts that direction signs should bear it is well within reason to expect that all curves, descents and places of possible danger shall be so plainly shown that there could be no mistake.

Illustration No. 8 shows a sign where a cross highway and a main thoroughfare meet. There is a triangular plot where the travellers have turned at either side of the sign into the principal road. This post carries two signs, the larger indicating the main way, and the smaller the cross road. The cross road sign can only be read by passing at the left of the post toward the main highway, and the larger board cannot be read until one is in this highway. Approaching the cross road from the other side of the sign one must drive past it to read it, and turning from the cross road toward the right neither sign can be read. Besides this there is but one distance given. Were the direction board mounted on the top of the post, and if it were triangular, it would meet most of the requirements. As it is, a traveller must stop and alight, or drive around it, which is a condition shown by illustration No. 9.

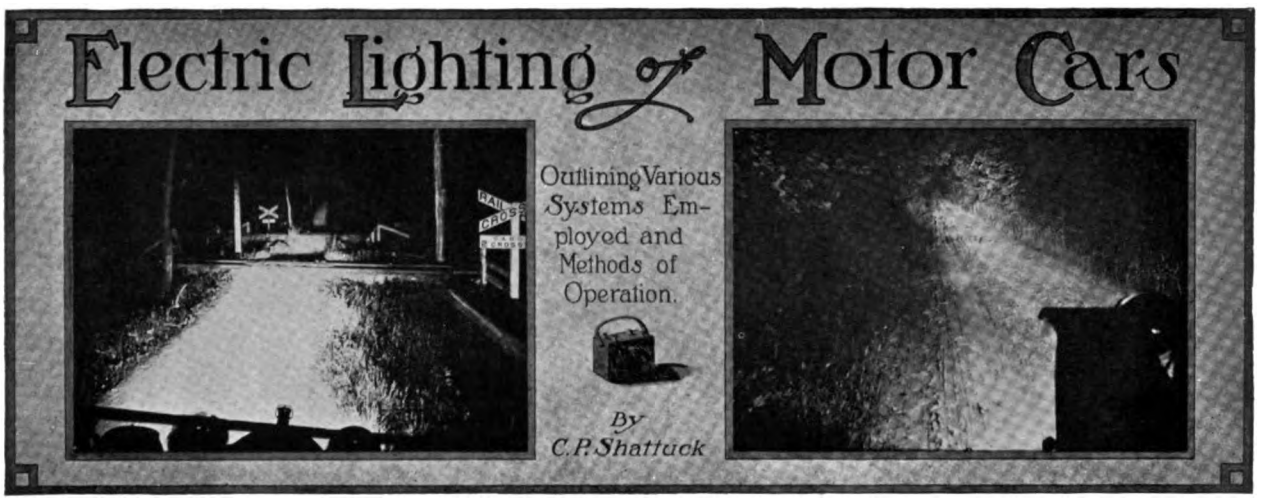
A similar instance of how a sign should not be located is shown by illustration No. 10, where a motorist in a cross road encounters a guide post that cannot be read unless the driver alights, or guesses and takes the chance of driving into the wrong direction, and being compelled to turn, a somewhat difficult undertaken in most country roads. Not only this, the sign is badly weather beaten and hardly legible, and a couple of charges of shot blown through the larger board does not add to its legibility. Were this sign of trianglar shape and on top of the post practically every purpose would be served. Illustration No. 11 shows how obscure a sign of dilapidated condition would be at night.

Illustration No. 12 shows a signboard at a fork in a main highway where the next point and the distance is given for one road at the fork, but no information whatever is given about the other. A traveller driving into the main road from the unmarked way would of necessity be compelled to alight to read the sign. If the sign were properly inscribed this would not be necessary, and it is reasonable to assume that the inscription might have added but a few cents to the original cost. Illustration No. 13 shows the sign itself, which is sufficiently specific, but serves for but one road.

Illustration No. 14 shows a sign that contains no less than four directions on one board, relative to one of two intersecting roads, and practically no information about the other, which, by the way, is by far the most important, being traversed by 50 vehicles to one being driven over the other. The location of the sign is at a corner and is not to be criticised, but the condition of the paint is such that it is hardly legible unless one is close to it.

Illustration No. 15 shows how difficult it is to read the directions for the cross road unless the sign is passed. Illustration No. 16 demonstrates how a cross road is admirably defined and the distances well given, while the main highway, which in this instance is one of those most travelled between New York and Boston, is designated by a sign put up by a motor car manufacturer to advertise his machines. That such conditions exist is surprising, but unfortunate.

Illustration No. 17 is that of a road in one of the most prosperous of Massachusetts towns, directly connecting with one of the main trunk highways, which has been "improved" by dumping loose gravel to a depth of about 15 inches upon it. The soil is a red clay and the road is cut into the ground perhaps a foot. Into this path was heaped the gravel, it being the evident intention of the "road builder" that the traffic should cause consolidation. Because of the hard soil the gravel did not settle and it now is about as poor a section of road as one could conceive. It will be a matter of time before the gravel will be spread over the cut in the soil and when the clay shall become softened with water it is probable the gravel will disappear and the path will be quite as bad as before work was done on it. It is a condition decidedly unexpected in a state that has been regarded as a leader among the commonwealths constructing highways, and it illustrates the ignorance and folly quite characteristic of municipal road construction. It has no special place in the argument for highway traffic protection, but it demonstrates one of the reasons why the main roads are used and the vehicular travel multiplied upon them, and emphasizes a statement made earlier in the article.



BERRY ROCKWELL MADE MANAGER.

Berry Rockwell, one of the veteran advertising men in the automobile field, has been appointed general advertising manager of the United States Motor Company, with headquarters in New York City, succeeding Gridley Adams, resigned. Mr. Rockwell held a similar position with the Maxwell-Briscoe Motor Company of Tarrytown, N. Y., previous to the formation of the United States Motor Company.

WILLYS-OVERLAND BAND ON VACATION.

Leaving Toledo, O., June 12, the entire band of the Willys-Overland Company of that city, comprised of boys and men from the various departments of the immense plant, started on what is to be a month's vacation, which will take them through several western states and to 24 of the principal cities of the territory. The outing is complimentary by the company and among the cities where visits will be made and concerts given are St. Louis, Memphis, New Orleans, Galvestoh, Houston, Dallas, El Paso, Tucson, Los Angeles, Sacramento, San Francisco, Portland, Salt Lake City, Cheyenne, Rawlins, Kansas City, Des Moines, Colorado Springs, Denver, Minneapolis, Milwaukee and Chicago. The band is under the direction of Herr Gustav Koehler, one of the most capable musicians of the Middle West.

Part X—K-W Lighting System.

HAVING in mind the desire of a large number of owners to understand thoroughly every working detail of their cars, including the fitting of auxiliary equipment, the K-W Ignition Company, Cleveland, O., has produced an electric lighting system which is particularly noticeable for its simplicity and adaptability. Special attention also has been paid to the matter of easy installation, the design being such that the current producer may be located at any convenient place, operated from any moving part of the power plant, and actuated either by belt, friction wheel or chain.

The K-W lighting system is the result of extended experimentation, covering a period of years, in which every effort was made to secure a thoroughly dependable source of electric energy, which could be supplied to the motoring public at a moderate cost. In bringing about this desirable feature, two other important factors have been considered at the same time.

Simplicity and Adaptability.

As is more or less well known, many motorists hesitate to install a mechanical generator of this type, on account of the alterations that may be necessary to the power plant, quite as much as because of the expense involved. This applies particularly to those who do not own the modern car, in which provision usually is made for such installation. The K-W system entirely eliminates this objection, due to the fact that it may be installed in any convenient place, as previously indicated.

The other prime requisite is simplicity, and the absence of complicated parts is a very distinct feature with the K-W lighting magnetos which generate a low-tension alternating current. They may be operated in either a clockwise or anti-clockwise direction, and without regard to polarity; that is, the wires may be attached to either terminal of the device. Such construction permits of installation without a knowledge of electricity, as the wiring of the car is very simple, the company's diagrams being followed easily.

All magnetos are constructed alike with the exception that the exterior of the six models is designed somewhat differently, this being merely for the convenience of installation and driving. Models A L, F L, M L and E L are equipped with pulleys for a flat belt drive, while models U L and D L are friction driven. The model U L magneto depicted at Fig. 65 is a type that is most universally used because of its ease of installation, it being provided with a special hinged bracket base.

Its vertical thickness including base is 4.5 inches

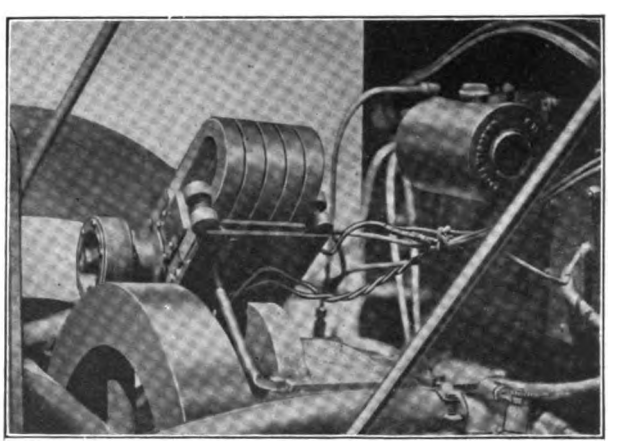

Fig. 64—Depicting the Adaptability of the K-W Lighting Magneto Which May Be Operated at Any Angle.

and its horizontal length is 10. Its width, including shaft and friction wheel, is 8.75 inches and weight 23 pounds. It will be noted that the device is fitted with a flexible spring which maintains the proper contact of the friction wheel with the flywheel or other part driving the member.

Construction of Magneto.

Throughout, the construction of the K-W magneto is commendable for its simplicity. Its principle is patented and differs from other instruments in that the armature shaft, instead of revolving around wires

Digitized by Google

wound longitudinally, has a stationary spiral winding of copper ribbon as illustrated at Fig. 66.

The rotor changes the direction of magnetic flux through the winding, four times a revolution, and produces four powerful waves of alternating current each revolution of the magneto. The company claims that this inductor type of generator will produce from two to three times as much current for given weight and size as any other magneto. No commutator or brushes are utilized to collect the electricity generated, the current flowing through the terminals of the

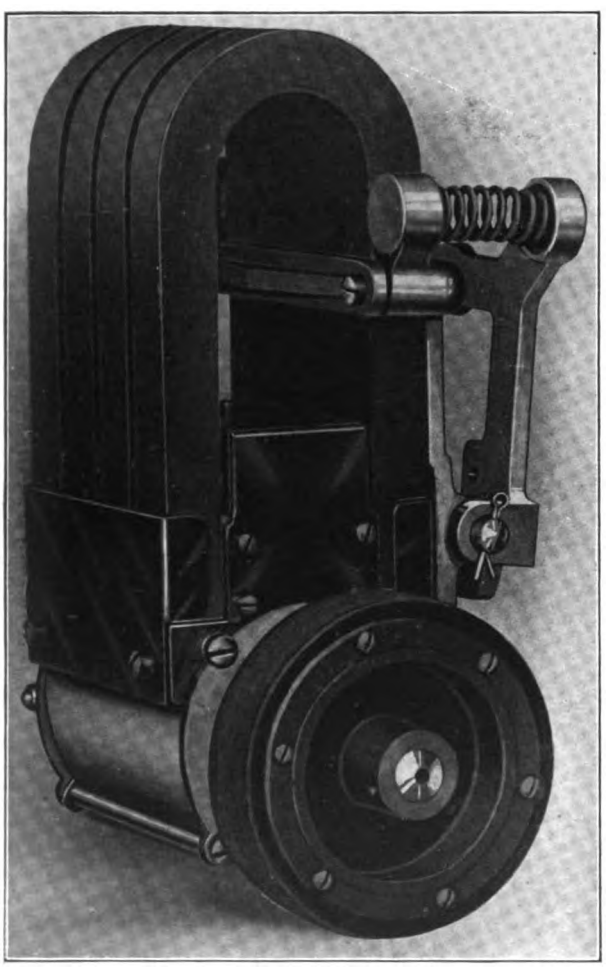

Fig. 65—Model U L K-W Magneto, Driven by Friction, Its Wheel Being Automatically Held to Proper Contact.

winding, which extends through the top of the pole pieces in which the rotor revolves, and the posts are securely connected to binding posts located at the end of the magneto.

The rotor revolves in two sets of high grade ball bearings and does not come in contact with any other part on the magneto as all other components are stationary. The magnets are of a high grade steel and are guaranteed not to demagnetize or lose their strength unless disassembled by an inexperienced person or because battery current is passed through the winding. The generating components are housed in a brass casing, fully protecting the parts from foreign elements, and it is pointed out by the maker that any amount of spray or rain will not interfere with its operation. Throughout, the highest grade of material and workmanship is incorporated and all magnetos are covered by an unusually broad guarantee.

Control of Current.

Unlike some lighting devices the current developed by the K-W magneto is not controlled by governors, cut-outs, springs, etc. It is electrically regulated and the method is one of the many features of the generator. A magneto is like a dynamo in principle, only up to a certain point when a considerable difference exists. With the K-W inductor type the current output does not depend wholly upon speed of magneto, because it is amperes instead of volts that really heat the lamp filament and create the light. The principle of the K-W is that of operating at a speed sufficient to secure that voltage necessary to overcome the resistance of the lamps and force all amperage that the magneto is capable of developing through the tungsten metal. Regulation is assisted by employing lamps of proper amperage.

As the K-W magneto has permanent magnets, its magnetic field is fixed and invariable and it is stated that when the current output is reached it does not increase with the speed above that point, because of the fact that the field cannot increase. The winding is specially adapted for lighting purposes and an air gap between the rotor and the pole pieces is so adjusted as to make them self-regulating to a very close degree, this arrangement caring for the variable speeds of the automobile.

The company points out that its success with road lighting outfits is due to the careful consideration of the lamp problem. The bulbs must be of the right size or capacity to develop full candlepower when they are absorbing the entire electrical output of the magneto. This condition is usually attained when the automobile is operating at approximately 12 miles an hour on the high gear. Below this speed the lamps burn slightly less brightly but will furnish an ample light at all speeds above eight miles an hour, which rate is maintained in traffic and usually on lighted city streets where the utilization of the headlights is not essential.

Lamp Loads.

The K-W lighting magneto will maintain a group of lamps to the extent of 40 candlepower and will light brightly two six-volt, three-ampere, 20 candlepower bulbs. It is stated that these when fitted to the headlights manufactured by the company will give a 2000 candlepower beam. This increase of light is due to the reflecting material utilized in the construction of the parabola reflectors which are of hand burnished silver.

Developing an alternating current, the magneto cannot be employed to charge storage batteries, and

Digitized by Google

the company recommends that the generator be utilized for supplying current to the headlights and that the side and tail lights be supplied with a storage

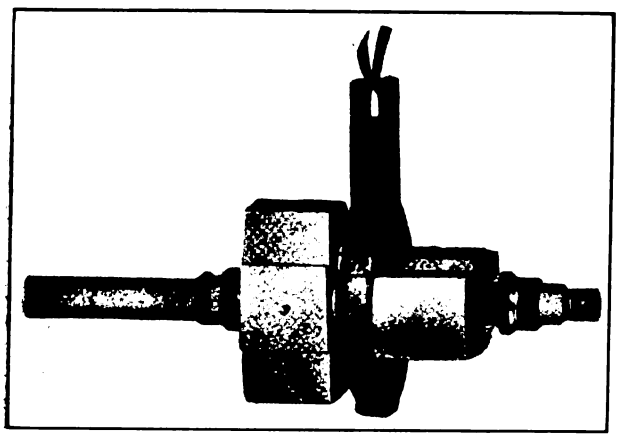

Fig. 66—Outlining the Simplicity of the Construction of K-W Magneto, Which Is Electrically Regulated and Has a Fixed Magnetic Field.

battery, inasmuch as a 60 ampere-hour member would furnish current for a considerable period at a slight expense, and that the battery could also be utilized for ignition purposes if desired. This system provides lighting when the automobile is inoperative or when driving through the city where the use of the powerful headlights is not needed.

As it is desirable to economize battery current and to utilize that produced by the generator to light the tail lamp when the motor car is in motion, the company makes use of an ingenious arrangement of the tail lamp, this consisting of double bulbs. One is connected in the battery circuit while the other is included in the magneto circuit, the method of wiring being outlined at Fig. 67. The advantage of this system is obvious. Should the magneto bulb become broken, the battery lamp may be switched on, or vice versa.

Lighting and Ignition.

While the lighting magneto may be employed for ignition purposes, it must be utilized in connection with a coil and timer, and the K-W Ignition Company suggests that when the device is being used for lights at night, batteries be employed for ignition during these few hours. The magneto will develop ample current to take care of both systems at the same time, but on account of the difficulty of properly balancing the ignition system so that neither the lights nor ignition will draw more than its share of current, the maker does not recommend their use together.

In explanation it is stated that the current developed by the magneto is much stronger than that of the battery, but if the resistance of the lamps becomes less than that of the combined coil and timer, the current, like water, will flow along the path of least resistance, or through the lamps, and the ignition is liable to be affected. Such a condition would not be through any weakness of the current generator, but through a high resistance of the timer or coil circuit. A method of wiring is suggested at Fig. 68 C, but as the company states, it is not likely to be as satisfactory as the separate ignition system.

Wide Range in Installation.

One of the commendable features of the K-W lighting magnetos, in addition to their compactness and light weight, is their ease of installation. They may be operated at any angle, an arrangement that appeals to the motorist who attends to the upkeep of his automobile. Model U L is provided with a special hinged bracket base and is operated by friction. This design lends itself readily to attachment to the majority of power plants. When this magneto is fitted it is rigidly attached, as the spring device insures proper contact of the friction wheel at all times, requiring no attention whatsoever. The hinged base may be taken off and replaced on another side of the magneto, bringing the friction wheel in another position.

Sometimes there is room between the radiator and the motor to attach an eight-inch pulley on the crankshaft and a smaller pulley on the magneto and drive by belt. Models A L, F L, M L, and E L are designed to be operated by a flat belt and these members are fitted with a special coil spring device which automatically maintains the tension of the belt. Model E L has the pulley at the top and may be equipped with a friction wheel if desired. Model M L is fitted with a slotted base, this permitting of an easy adjustment of the position of the magneto which is designed to be driven by belt.

Model F L is the same as A L except that it is inverted, has a rounded base and its magnets are an inch shorter. It is designed for installation where there is not room for mounting above the flywheel of the power plant. It is equipped with a special bracket

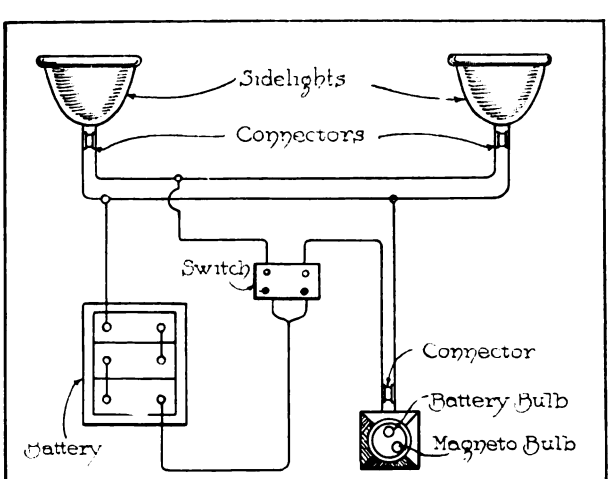

Fig. 67—Wiring Diagram for Side Lamps and Tail Light. Note the Double Bulb Arrangement of Rear Signal.

for bolting to the frame of the car or to a brace, according to requirements. The friction wheel tension spring may be so fitted that it will push the wheel

Digitized by Google

away from the base of the magneto, instead of toward it as with the standard equipment.

On some cars the flywheel is so enclosed or so inaccessible that it is practically impossible to mount a magneto in any other way than to take the drive from the fan shaft. This method is recommended in preference to the utilization of a belt operating over several pulleys. When the thermo-syphon cooling system is employed and the power plant does not permit of the friction wheel magneto, the generator may be mounted upon the frame and a flat belt fitted to the flywheel of the motor.

Although sprockets and chains may be employed the company points out that its Aqua belting is stretch and water proof and is silent in its operation. As all of the belt models are fitted with a special tensioning device, the magneto will be driven properly at low or high ratios. The wide variety in design makes the K-W lighting magneto adaptable to any make of motor car and the installation may be performed by the operator without altering the power plant or the fitting of expensive attachments.

finish is brass, although nickel or black may be had, these being extra.

The double bulb tail lamp is made of heavy polished brass and is four inches high and 4.5 wide. The ruby lens is 2.25 inches in diameter and the clear lens three inches. It is equipped with screw base candelabra sockets for two bulbs as previously explained. In addition to these the company markets a wide variety of lamps, including dome, bracket, inspection, speedometer, etc., as well as electrical attachments for oil lamps.

The wiring plans are very simple and a lighting equipment may be installed easily by those not familiar with electricity. At Fig 68 B, is depicted the method of wiring the generator when headlights and a speedometer light are employed.

In addition to manufacturing lighting magnetos the K-W Ignition Company produces a lighting outfit especially adapted for the model T Ford. The outfit is inexpensive and consists of a pair of eight-inch headlights with parabola reflectors, two tungsten bulbs, 12 feet of wire, all soldered to the lamps, a

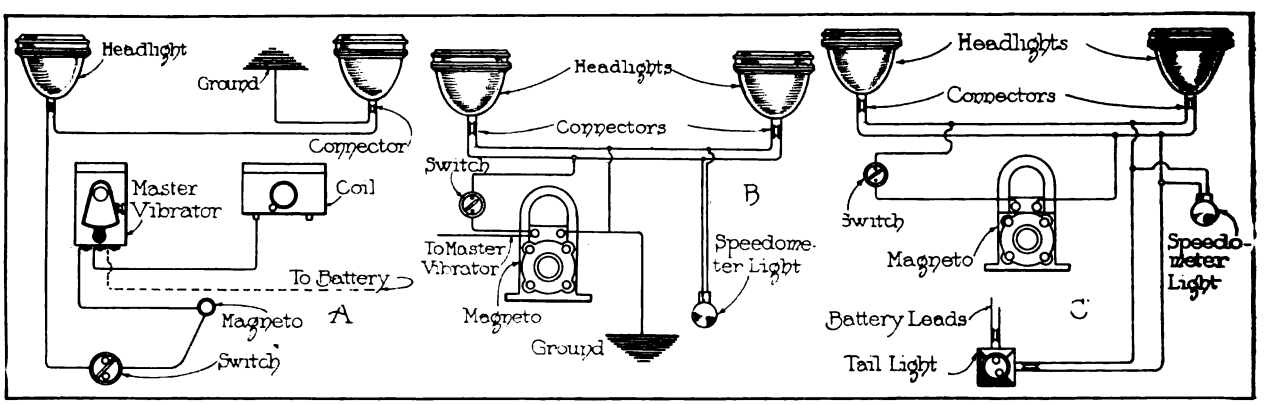

Fig. 68—Wiring Plans of the K-W Lighting Systems: A, Outfit Designed for Ford Cars; B, Method of Lighting Headlights and Speedometer Lamp by Magneto; C, Combined Lighting and Ignition.

The company supplies a complete lighting outfit, this consisting of the magneto, one pair of high grade headlights with hand burnished silver parabola reflectors, two Mazda six-volt, three-ampere bulbs of 20 candlepower each, 10 feet of duplex lighting wire, lighting switch and complete instructions for installation. If desired the magneto may be purchased separately. The K-W Ignition Company has made a considerable study of bulbs and recommends the use of what is known as the National Electric Lamp Association's style G 16.5 lamp, which is 2.0625 inches in diameter.

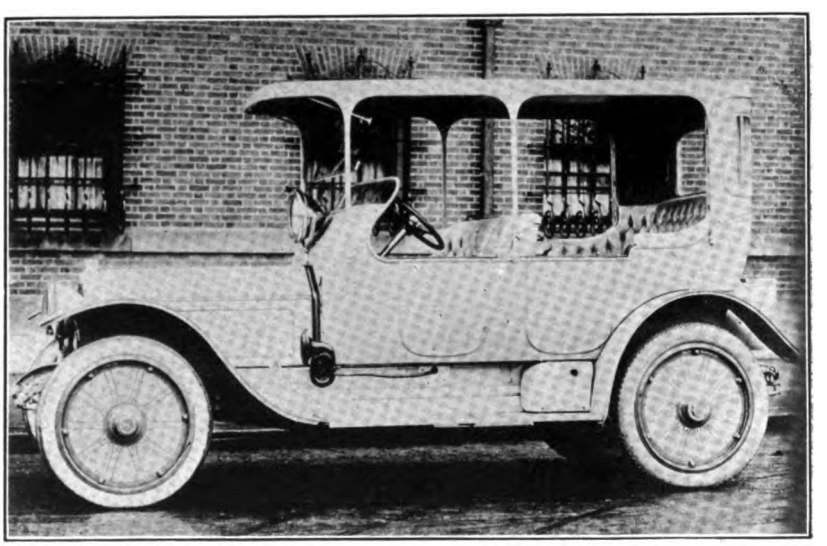
The K-W headlights are made either straight body or bullet shape, constructed entirely from one piece drawn from steel dies, and are free from soldered joints. The reflectors are set in the door against a felt ring, making the lamp moisture and dust proof. The focus, which is adjustable, is 1.125 inches and all lamps are provided with Ediswan sockets which prevent the bulb from becoming disconnected with the socket and throwing the load on one lamp. The Diamond switch and an instruction sheet for installation. The wiring diagram is outlined at Fig. 68 A and it will be noted that provision is also made for the installation of the K-W master vibrator.

(To Be Continued.)

QUICK TIRE CHANGE.

An interesting feature in connection with the recent 500-mile race at Indianapolis was the speed with which tires were changed on the various cars. The winning National made a record of 30 seconds, while men in the press stand timed a change on De Palma's Mercedes in 23 seconds. All the machines to finish with the exception of the Fiat, were equipped with Michelin tires, made by the Michelin Tire Company of Milltown, N. J. The concern has followed racing so closely and with such success that it realizes the importance of detail in handling tires in the pits, and employees of the company have worked this out to an exact science.

Digitized by Google



SPECIALLY CONSTRUCTED PEERLESS.

Having adopted a policy of installing in its service branches throughout the country equipment capable of practically building a car, the Peerless Motor Car Company, Cleveland, O., is able to undertake the construction of any special vehicle that a purchaser may desire. An accompanying illustration presents a Peerless 38-Six chassis on which the Boston branch recently fitted a body and other special equipment quite unlike any other car. In this respect, at least, the machine went to the purchaser as a thoroughly custom made product.

It will be noted, for instance, that the wheels have an individuality all their own. The spokes are entirely covered with metal discs, concave from hub to rim and painted to represent concealed spokes. There are openings in the covering to allow access to the tire valves, etc. The dash is exceptionally high, and is made of aluminum, being integral with the front of the car. It is topped by a celluloid panel six inches high. A slight concavity in the centre of the dash permits of mounting an extra headlight so arranged that every time the steering wheel is turned the light is turned correspondingly. In this manner, the beam always points in the direction the car is about to take.

The top is stationary. It resembles a limousine without sides or windows. The supports are hollow and serve as water pipes carrying off all rain and preventing it from dripping onto the occupants or the other parts of body. When not in use, the windshield folds up under the front of the top.

The entire construction was designed by the purchaser and carried out under his direction in the Peerless Boston branch. Besides being a splendid example of the coach maker's art, the completed vehicle ably demonstrates what may be expected when work of this nature is submitted to the branches maintained by this company.

Neat and Attractive Special Body Design Fitted to 38 Horsepower Six-Cylinder Peerless Chassis.

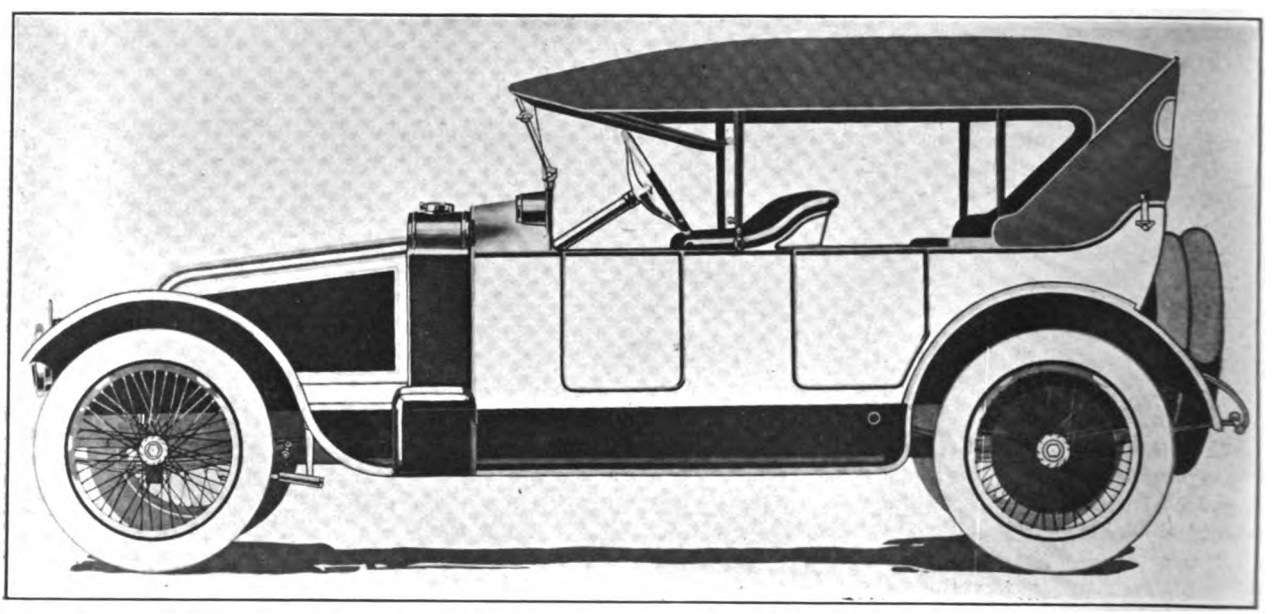
WIRE WHEELS MEAN LONGER LIFE.

The subject of wire wheels is interesting manufacturers of automobiles and tire makers throughout the country. Many of the manufacturers, it is claimed, are considering seriously the fitting of their product with such wheels. According to J. C. Matlack of the Ajax-Grieb Rubber Company, Trenton, N. J., wire wheels mean longer life to the tires and greater comfort to the rider, as the more elastic combination of wire and rubber would eliminate the stiffness that is noticeable in a wooden wheel with a hard inflated tire.

NEED FOR TIRE CHAINS.

After investigating the matter of automobile accidents, several highway commissioners have come to the conclusion that many of these could have been avoided by the use of tire chains. One commissioner finds that 90 per cent. of the accidents reported to him were caused by cars, not equipped with chains, skidding into collision with other vehicles or stationary objects. The following extract from his report is of particular interest to motorists:

"It is surely self-evident that no one may properly be called an efficient and safe driver of a motor car unless he has at all times complete control over the machine which he is driving. No person driving over a slippery road has complete control of a motor car, with wheels equipped with nothing but the ordinary rubber tires. In an emergency, he cannot apply his brakes with full force without starting his car spinning about a slippery road, likely to land in the ditch or against the nearest tree.



"Any man who will take the trouble to study the reports of automobile accidents, will see by a mere glance over the figures that at least 90 per cent. of all accidents to motor cars are caused primarily by skidding. It is often difficult to tell after an automobile accident exactly what was the cause. When a car skids into a ditch and is found with a broken axle, there is often doubt as to whether the breaking of the axles sent the car into the ditch.

"There is just one way in which a motor car can be adequately controlled on a slippery road, and that is by tire chains properly adjusted to the four wheels of the car. Equipped with tire chains, not the slightest difficulty will be experienced in gaining complete control, and such a thing as skidding will be impossible."

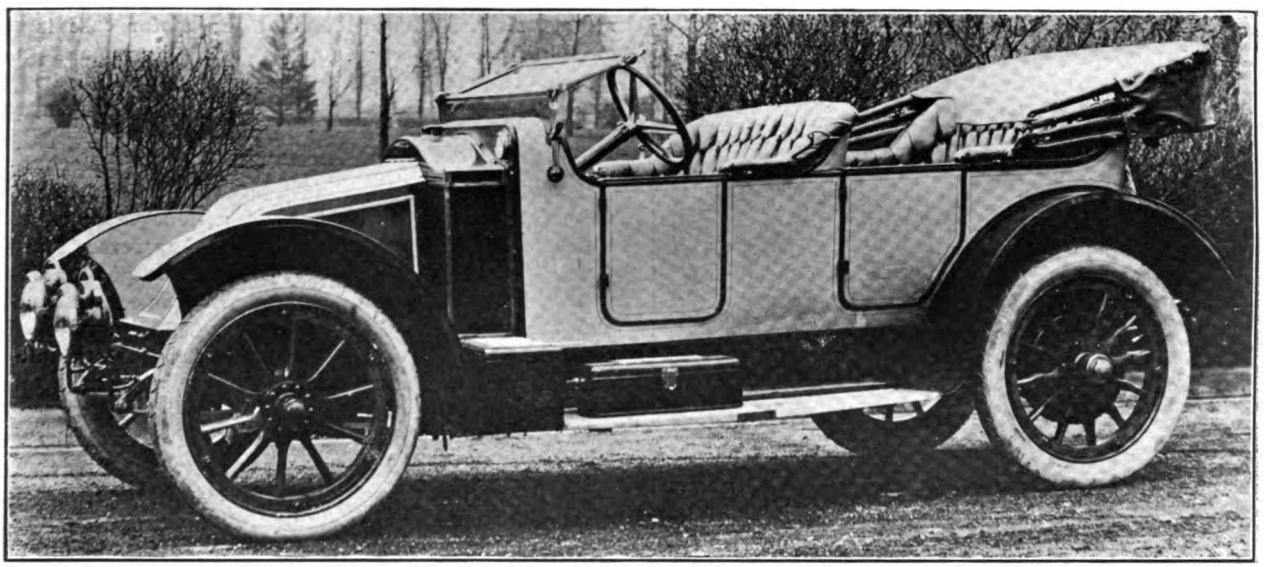
KEETON CARS HAVE TWO CHASSIS TYPES.

THE Keeton Motor Company, recently organized at Detroit, Mich., to manufacture the Keeton four and six-cylinder cars, has increased its capital stock from $10,000 to $300,000, and has practically completed negotiations for a brick and concrete factory building and arranged for factory equipment that will make possible the production of a very large number of machines. The statement is made that the company expects to manufacture 15,000 cars for the 1913 season, of which it is proposed that 90 per cent. shall be of the six-cylinder type. The officers of the company are: President, F. M. Keeton; vice president, W. G. Houck; treasurer, W. V. H. Moore; secretary, N. T. Brotherton; directors, F. M. Keeton; W. G. Houck, C. B. Shaffer, W. Brotherton and W. W. Wuchter. The Keeton Motor Company is distinct from and has no connection with the Croxton-Keeton Company, the latter organization being formerly licensed by F. M. Keeton to build French types of cars. Jene J. Lablanc is the Paris engineer and representative of the company, and Ralph H. Brown is the factory engineer.



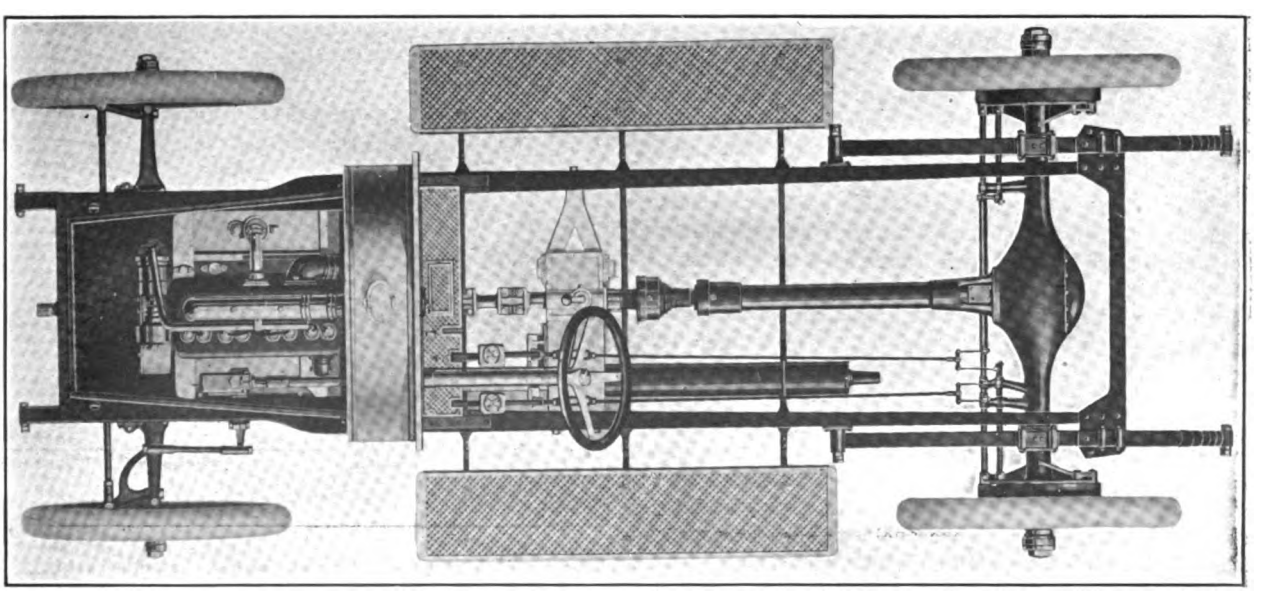
The Keeton Six-Cylinder 42-48 Horsepower Touring Car, Having Option of Wire Wheel Equipment, Showing the Features of Body, Hood and Top Design.

The purpose of the company is to produce cars that will be distinctive in appearance, constructed of high grade material to designs that have been developed to secure protection of all wearing parts, adequate adjustment for wear, and accessibility for examination and work. It is said to be the only French type of car built in America and it has exclusive features in the construction of the motor, which is of the small bore, long stroke type, a patented thermo-syphon system of cooling the engine, a brake construction that is held to be unusually efficient, as well as left side drive, centre control, self-starting equipment, electric lighting, option of wood or wire wheels, and other qualities that are characteristic of the most advanced designs and constructions.

The company is building two types of chassis, the four-cylinder and the six-cylinder, and these have motors that are of the same bore and stroke, the four being rated by the S. A. E. standard at 22.5 horsepower, and the six at 33.75 horsepower. The bore to stroke ratio is one to 1.40 and this affords a considerable increase of power production above the standard, so that the 32-38 horsepower and the 42-48 horsepower, respectively, claimed for the two engines is conservative. The same construction is used in each chassis save that the four-cylinder has a wheelbase of 120 inches and the six-cylinder 131 inches, and consequently an increased length of chassis frame and engine, as well as larger body equipment, there being heavier forward springs for the larger machines. The six-cylinder chassis will be fitted with Riverside touring bodies, with Meadowbrook roadster bodies, and with a Tuxedo coupe body, as regular equipment.

Because of the principal differences between the two chassis being only in length of motor and of chassis frame, the description that follows specifically refers to the four-cylinder construction. The motor is of the L head type with the cylinders cast en bloc of a fine quality of gray iron, the design being unusually symmetrical and sightly, with the water jacket and the carburetion and exhaust manifolds integral. The bore is 3.75 inches and the stroke 5.25 inches, and the

Digitized by Google

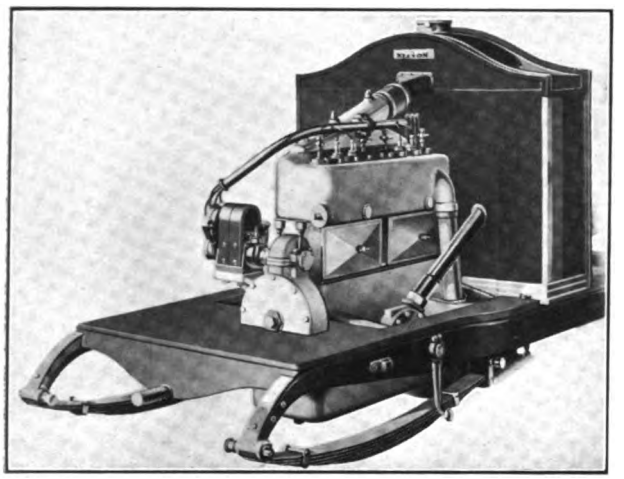


The Keeton Four-Cylinder 32-38 Horsepower Touring Car, with the Regular Equipment, Illustrating the Features of the Construction.

cylinders are offset .5 inch. The valves are at the left side and the valve stems and guides are within recesses formed by webs at the centre and each end of the block, these recesses being covered with plates retained by winged nuts.

The water spaces are extremely liberal and there is a large opening directly over the cylinder heads which is closed by the ample outlet manifold. Through this opening the jacket may be effectually cleaned of sand and scale. The exhaust and carburetor manifolds may be similarly cleaned. The block is long and the deep crankcase makes the motor seem to have unusual height. The crankcase is of aluminum, cast in two sections, with a reservoir bolted to the bottom and a housing that covers the timing gears. The cylinders are bored, reamed, aged and ground to size, and specially treated to neutralize stresses from casting or machining. The pistons are turned, aged and ground to an accurate fit and are similarly treated.

The fuel inlet is through a long, straight lead from the carburetor to the cylinder block, at the centre of the right side of the casting, and the exhaust is at the rear of the block at the left side. The water inlet to the block is at the rear at the right side of the water jacket base. The water outlet manifold is a large casting that covers the cylinder heads and it is retained to the block by three heavy bolts.



The crankshaft is drop forged from nickel steel,

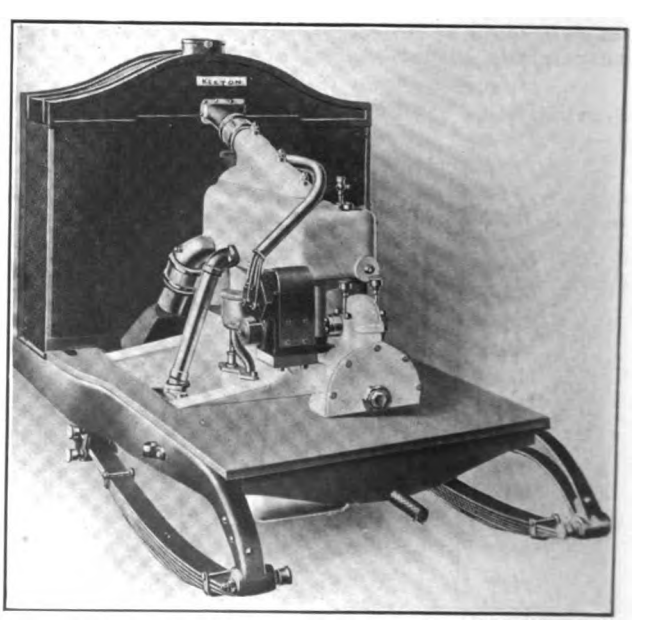
Digitized by Google

2.25 inches diameter, and it is mounted in three bearings, the forward bearing being 2.75 inches length; the centre bearing 2.5 inches length, and the rear

The Left Side of the Keeton Power Plant, Enclosed by the Wood Deck, Showing the Magneto Cable Leads, the Exhaust Pipe and the Accessibility of the Valve Mechanism.

bearing four inches length, this giving a total bearing surface of 9.25 inches for the four-cylinder motor. The bearings are of a special alloy metal. The camshaft is a special steel drop forging one inch diameter and it is carried on three bearings, the forward being 2.1875 inches length, the centre 2.5 inches length, and the rear bearing is a New Departure journal that takes the thrust of the shaft in either direction. The other camshaft bearings are of a special alloy metal.



The connecting rods are drop forged from a special alloy steel and are unusually long, this, with the length of stroke and offset cylinders, minimizing the side thrust on the cylinders. The crankpins are the full diameter of the crankshaft and the bearings are a generous length, the connecting rods being retained by bolted caps that are adjustable for wear with shims. The wristpins are large, of special steel, hardened and ground, and have large bearings of special metal in the piston bosses.

The valves are with ports 1.625 inches diameter and the valves are a special quality of gray cast iron, treated to yield unusual endurance, and with stems of carbon steel electrically welded to the heads. The valve stems are operated in cast iron guides that may be replaced when wear is manifest. The springs are sufficiently strong and the motor is so efficiently cooled that these are not affected by the heat. The cams are accurately cut, hardened and ground, and the tappet rods are of special steel, similarly fitted, that are operated in cast iron guides. The tappets are fitted with hardened adjusting screws and nuts to compensate for wear. While these parts are enclosed they are easily accessible for the removal of the plates covering them.

The timing gears are of hardened steel, of wide face and are cut spiral to minimize the noise of operation. At the forward end of the motor case is a circular case or cover housing these gears, and on this housing is a bracket for the magneto, the drive being from the gears directly above the crankshaft centre.

The engine is lubricated by a combination mechanical force feed and splash system. Bolted beneath the motor case is a reservoir of 3.5 gallons capacity, in which is a sump or well surrounded by screen, into which inlet of the pump is fixed. The base of the engine case is divided by a web, carrying the centre main and the centre crankshaft bearings. The bottom of the lower section of the casting is cast to form pits beneath the crankpins of each cylinder with ducts for drainage from the one to the other.

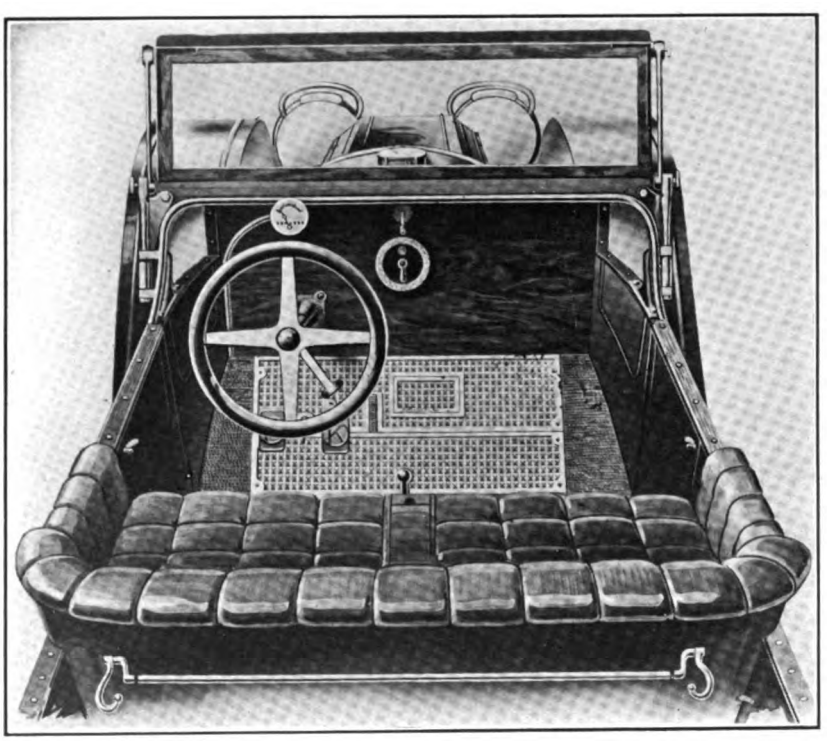
The lubricant is drawn from the reservoir by a plunger pump that may be adjusted to any predetermined capacity and it is then forced through a tube within the engine case. This tube is perforated at intervals and at each cycle of the pump the oil is forced in streams over the main and the crankpin bearings. These streams are sufficient to flood these bearings and the excess drains into the pits in the bottom of the crankcase. As the connecting rods sweep into these pools the oil is distributed by splash to the camshaft bearings, cams, tappets, tappet guides, wristpins, wristpin bearings, the cylinder and piston walls, and the drainage from the forward bearing maintains a constant level in the pocket formed in the base of the timing gear housing. The oil contained in the reservoir will suffice for 1000 miles driving, but in addition to this is a reserve tank of five gallons capacity that is connected with the engine case, and oil can be forced from the tank to the oil reservoir of

The Right Side of the Keeton Motor, Demonstrating the Enclosed Timing Gear, the Transverse Magneto Drive, the Magneto, Carburetor, Intake and the Water Manifolds.

Digitized by Google

the motor by a hand pump that is conveniently located on the heel board. The total oil capacity of the engine and the reserve is 8.5 gallons.

The motor is cooled by a patented system that is said to be unusually effective. It is stated that after the most severe tests the water has never been found to be heated to more than 170 degrees. The radiator is located, as is the dash, behind the motor. It is a cellular type of large size. The water is circulated through the motor and the radiator by large connections that afford an unobstructed flow. The flywheel constitutes a fan blower of considerable capacity. As may be noted the engine is surrounded by a deck that completely covers that part of the chassis usually left open. This deck prevents any draft of air downward and the flywheel forces a strong current of air from the rear below and through the radiator and out at the sides. This is in reverse of the Renault system by which the air is drawn from the sides through the radiator under the hood and downward under the car. The Keeton motor cooling is said to effectually prevent the heating of the floorboards of the forward compartment, and it eliminates the usual need of ventilation of this division of the body.



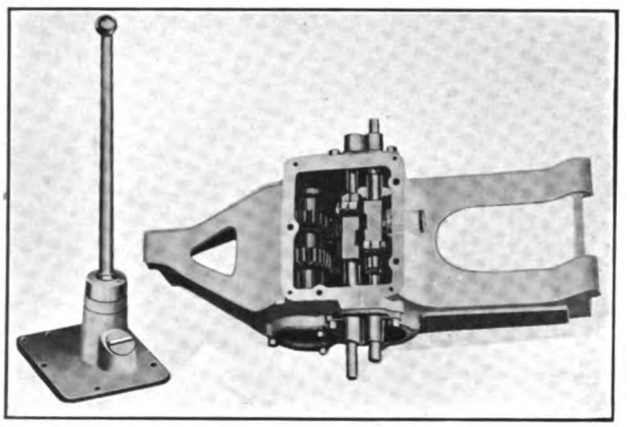
The fuel is atomized by a carburetor of the float feed automatic type that is said to afford a uniform mixture at all speeds and to be in every way efficient. The carburetor is located below the deck surrounding the motor and it is supplied by gravity flow. It is fitted with a hot air intake and a jacketed intake pipe, so there is no difficulty with carburetion at temperatures at which the car may be driven.

The ignition is a dual system, employing either the Bosch or Eisemann magneto with a fixed spark, and with a six-volt, 80 ampere-hour storage battery for starting or for reserve. The fixed spark has been adopted because it is the belief of the designer that this has proven in every way satisfactory and does not leave the car at the mercy of the inexperienced man. The spark is adjusted to the point of maximum efficiency before the machine is sent from the factory. The fixed spark is very general practise abroad.

The lower section of the engine case is extended back of the motor itself, this extension forming a housing for the lower half of the flywheel, and this housing is also united with the dust pan so that the engine is thoroughly protected against water, mud, dust and road accumulations.

The flywheel is formed so that it serves as a blower and it is also incorporated with the multiple disc clutch, composed of 48 saw steel discs that are driven in oil. The clutch engages easily and is free from "grabbing" and other objectionable conditions. It is said that this clutch has been examined after 125,000 miles driving and found to be practically unworn.

The clutch shaft is coupled to the transmission shaft by a large universal joint that compensates for all chassis distortion and fully protects the motor. The transmission has a selective sliding gearset, known as the Mercedes type, giving three forward speeds and reverse, and the shafts are chrome vanadium steel of large diameter and mounted on imported annular ball bearings, that take all end thrust. The gears are of the same metal, of such size and width that they will endure under the hardest service. Both gears and shafts are heat treated. The controlling mechanism of the gearset is a single lever mounted on the top of the case. The case is bolted to the chassis frame by three arms and is easily accessible through lifting the floorboards.



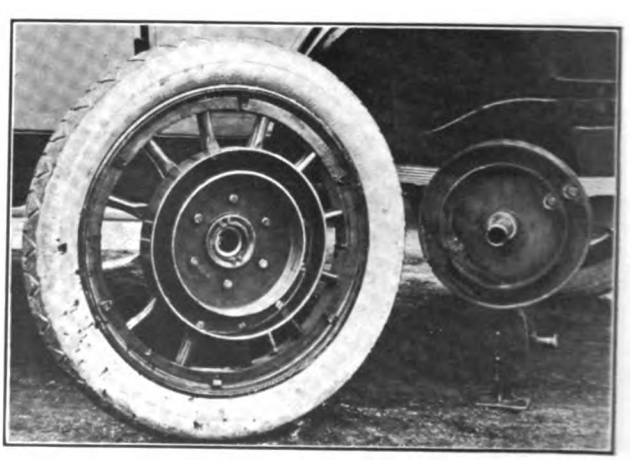
View of the Front Seat of the Keeton Four-Cylinder, Illustrating the Control Members and the Dash Installations.

The transmission case supports the driving system, the main transmission shaft being coupled to the driving shaft by a large universal joint. The squared forward end of the driving shaft is fitted into the universal joint. The universal joint is just ahead of the forward end of the torsion tube, which is with a seamless wall .15625 inch thick, and 2.5 inches outer diameter. Into this tube is fixed an imported annular ball bearing that carries the driving shaft, and there is a similar bearing at the rear end. The driving shaft

Digitized by Google

is 1.375 inches chrome vanadium steel. The driving pinion is taper fitted to the shaft and is secured to it by a Woodruff key, castellated nut and cotter.

The Keeton Transmission Gearset, Showing the Supporting Arms, with the Cover Carrying the Control Lever Removed.

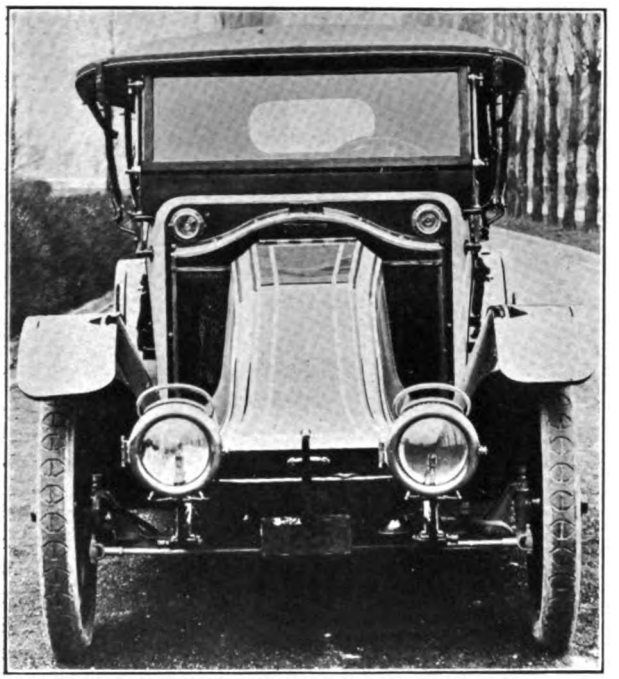


The torsion tube is bolted to the forward side of the rear axle housing, this shell being of pressed steel with a larger cover plate at the rear. The differential is a Brown-Lipe production, with nickel steel gears and it is mounted on imported annular ball bearings. The rear axle is a full floating type with a case of pressed steel, with axle shafts 1.375 inches diameter of chrome vanadium steel. The front axle is a chrome nickel steel drop forged I section, heat treated for endurance, with large yokes and steering knuckles, and heavy wheel spindles, the tiebar and steering linkage being of unusual strength.

The wheels are 34 inches diameter, artillery type, of selected hickory, with large hub flanges, 1.75-inch spokes, the rear spokes being bossed where the brake drums are bolted to them. The wheels are shod with 34 by four-inch tires forward, and 35 by 4.5-inch rear. The purchaser has the option of wire wheels with the six-cylinder cars, it being maintained that the wire construction affords greater resiliency, longer life to the tires, are lighter in weight and can be repaired or trued if damaged. Outside of the motor all bearings are the annular ball type, this insuring against material loss of power through friction.

The chassis frame is a pressed steel channel section of liberal width and depth, being cambered from a point about midway of the motor length to the forward spring horns, and raised five inches at the rear to permit the use of a special type of spring and to secure low centre of gravity. The frame is strongly braced by the web of the engine and the supporting arms on which it is mounted, the radiator frame, three cross members and the end members, besides the deck about the engine and the heavy aluminum toe board. The rear cross frame member is extended beyond the side members and to these ends are attached the springs, affording an offset, so that the frame is suspended between the rear springs instead of above them. The rear springs are three-quarter elliptic 50 inches length and two inches width, and the forward springs are 36 inches length and two inches width, of a special quality of alloy steel designed for automobile spring construction. The cars are claimed to have unusual riding qualities because of the wheelbase length, the quality of the springs and the manner of suspension, while there is a road clearance of 12.25 inches, despite the low centre of gravity. The weight is so distributed that skidding is minimized and the cars are extremely steady when driven at high speeds.

The cars are driven from the left side, this following foreign practise, as well as a design that is finding much favor with automobile engineers and with the motorists. The steering column is of unusual length and rake and it is carried through the radiator, the lower support being firmly anchored in the heavy web of the motor case. The steering gear is of the worm and gear type, with large thrust bearings either side of the worm, all of the moving parts being enclosed in the housing. The gear is adjustable for wear and is operated with an 18-inch hand wheel, there being a throttle lever with a handle that is fitted to one's fingers just below the wheel.



The control of the car is by two pedals and a single hand lever. The left pedal operates the clutch, and its connection is so designed that while the foot pressure to a certain point will disengage the clutch, "pushing through" the pedal will apply the service brake. The right pedal actuates the emergency brake. By a ratchet device this brake may at any time be set. The brake construction is unusual and is said to have high efficiency. The brakes are of the internal expanding type, with floating shoes, and are operated on concentric drums, this design having every desired quality, it is claimed. The construction differs from the usual forms because of the entire

The Concentric Brake Drum of the Keeton Cars and the Floating Brake Shoes, the Outer Being the Service and the Inner the Emergency Brake.

mechanism being carried on the rear axle. The brake shafts extend completely across between the brake drums and the linkage system is such that the brak-

Digitized by Google

Front View of the Keeton Four-Cylinder Car, Showing the Symmetrical Appearance of the Hood, Radiator and the Dash with Its Inset Lamps.

ing leverage is applied equally upon each drum. There is a single rod between each pedal and the linkage, so that the pull is always direct and positive. The service brake is within a drum 16 inches diameter and two inches face, and the emergency brake is within a 12 inches diameter drum with two inches face. The brake shoes are faced with thermoid and cannot be burned by service. All of the brake adjustments can be made by lifting the floorboards of the car.

The control lever, by which the speed ratios are obtained, is located in the centre of the car at the right of the driver, being in every way convenient. The head of the lever is moved not more than three inches in changing speeds. The foot accelerator is connected with the hand lever throttle control on the steering wheel. The gear reduction is 3.5 to one with the touring cars and three to one with the roadsters, if this is desired. This gives from three to 60 miles an hour on high speed.

Great care has been taken to lubricate all moving parts, grease cups being provided for bearings not otherwise reached by lubricants. The wide web of the engine and the deck, and the extension of the engine case and the dust pan protect the driving system from water, mud, dust and the like.

The cars are now designed for acetylene gas head lamps, electric combination and oil dash and tail lamps with storage battery for these, all lamps being furnished in brass and black enamel. A combination motor starter, ignition and lighting system from a dynamo is now being tested.

The bodies are of sheet steel with wood frames and are of the fore door type, roomy and commodious. The touring cars have five passengers capacity; the roadster two, with tire deck and space for carrying two coat cases, and the coupe three passengers. All boards are cast aluminum. The hood is the Renault type and is decidedly graceful, and the bodies, the long sweeping fenders, the unobstructed running boards and the ample splash aprons thoroughly harmonize. The steps are cast aluminum.

In finish three combinations are given: The one is with body and hood of royal blue with white striping and black molding, with chassis of French silver gray with blue stripe; the second is with body and hood of brewster green, white striping and black molding, with chassis of brewster green with white stripe, and wheels of natural wood; the third is with body and hood of royal maroon, with ivory white striping and black molding, with chassis of Mercedes red and black striping. The upholstery is of first grade leather, long grain, black glossy finish, with ample seat and back cushions of the highest quality of hair, making for comfort in riding.

The standard equipment, besides that already specified, includes a special design mohair top, dust cover, special rain vision windshield, speedometer, electric lamp lighter, electric horn, extra demountable rim, tire irons to carry two extra tires, auxiliary oil and gasoline tanks, full set of tools, pump, jack, tire repair kit, robe and foot rails. The fuel capacity of the touring car is 19 gallons of gasoline with four gallons reserve, and five gallons of lubricating oil; of the roadster, 30 gallons of gasoline, with five gallons reserve, and five gallons of lubricating oil. The weight of the touring car, completely equipped, is 2850 pounds, and of the roadster, similarly equipped, 2650 pounds.

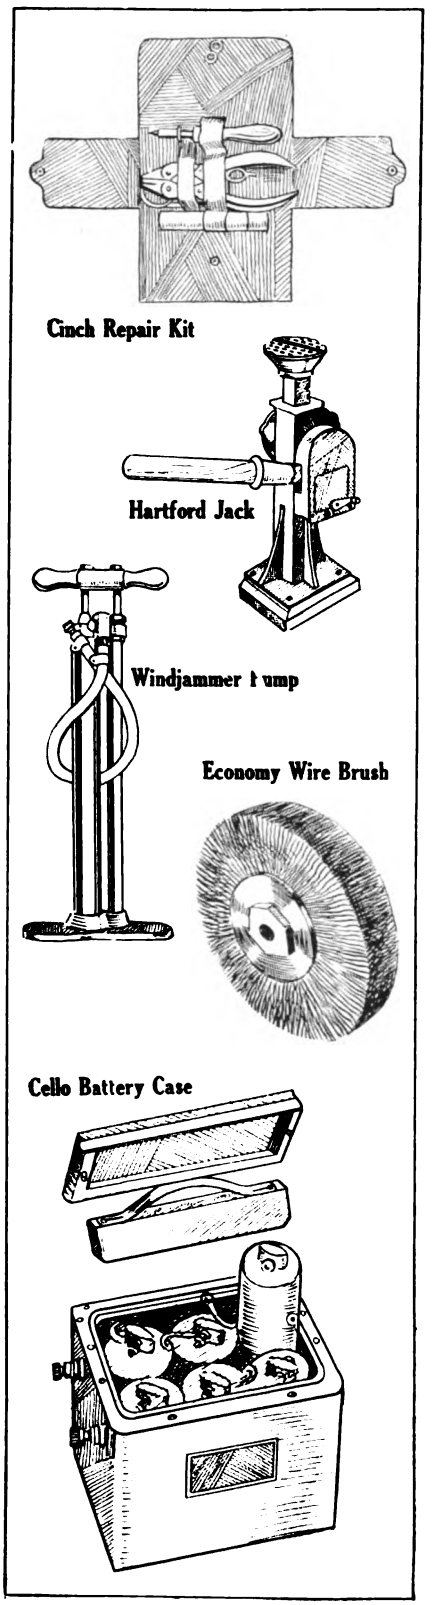
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.



The Cinch Tire Repair Kit, marketed by the Hailstone & Winmore Company, Northampton, Mass., is a device with which it is claimed an inner tube may be repaired when punctured in a very short time without removing the member from the wheel. The outfit comprises a number of rubber plugs, a cutting tool, a wire spreader and a pair of patented pliers. The patching plug is made in two parts, having a space between the sections, and so devised that these may be compressed, thus sealing the aperture in the inner tube. The wire spreaders are utilized for temporarily enlarging the puncture and for making easy the insertion of the plug which is of rubber and metal. It is stated that an inner tube may be repaired in less than a minute, that it will not leak and that the repair is permanent.

★

The Hartford Auto Jack, manufactured by the Hartford Suspension Company, Jersey City, N. J., maker of the Truffault-Hartford shock absorbers, will appeal to motorists who desire a jack which will lift a heavy car without undue effort. The working parts are constructed of solid chrome nickel steel fitted in a casing of tough malleable iron and it is pointed out that the tool will survive the roughest treatment. It operates up or down, these movements being possible by the moving of a small lever, and as the positions are indicated there is no guesswork when utilizing the device.

★

The Windjammer Automobile Tire Pump, manufactured by the Bridgeport Brass Company, Bridgeport, Conn., is said to differ from those of usual construction as to disassemble the device it is only necessary to unscrew one nut. The cylinders are constructed of heavy gauge seamless brass tubing and these are fastened into the foot base in such manner as to be absolutely air tight. This operation is performed by a special process. The top is made of malleable iron and is said to be practically unbreakable. The Bridgeport product is provided with a heavy coil spring on the piston rod, this preventing any violent upward movement from damaging the top.

★

The Economy Wire Brush, produced and marketed by the Williams Foundry & Machine Company, Akron, O., maker of automobile tire repair equipment, is designed to be utilized with a buffing stand, but it may be operated on an ordinary emery grinder. Where there is much work to be done, it is claimed that the brush will save considerable time in preparing casings and tubes for cement and new material. The device is constructed of steel wires in suitable lengths and it is claimed that the material will not break. It is made with different diameters as well as width of faces.

★

The Cello Battery Case is produced and marketed by the A. S. Campbell Company, 284 Commercial street, Boston, and is specially designed for automobile or marine service, as the hermetic case protects the dry cells from all moisture. The walls of the holder are .5 inch thick and the interior of the container is sealed with a water proof compound. The lower section is fitted with a bronze rim equipped with a substantial rubber gasket, which is compressed when the cover is fitted, inasmuch as this also has a gasket which presses against the rubber. The cells are held securely by a block on which is mounted a spring. Two binding posts or terminals are fitted to the exterior of the holder. The case is adaptable to any make of dry cells and is constructed to hold six batteries. It is neat and compact and the exterior well finished.

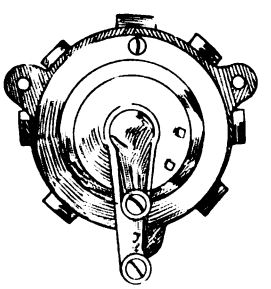
The Victor Grease Gun, marketed by the Judd & Leland Manufacturing Company, Clifton Springs, N. Y., will appeal to motorists as the device holds two pounds of lubricant which is not injected into the differential or other part by the usual method, but by the utilization of a tire pump. The spout end of the gun is removable, and having a three-inch aperture is filled easily. The pump is then attached and a few strokes produces sufficient compressed air to force the lubricant out of the gun when the stop cock, with which the instrument is fitted, is turned to an open point. The gun is equipped with a reducer adaptable to the spout for service when lubricating universal joints, etc.

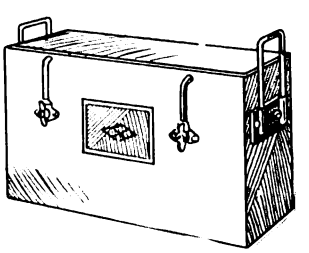
★

The Sword Piston Ring Remover, made by the Sword Manufacturing Company, Inc., New London, Conn., is designed to make easy the removal and replacement of piston rings, it being claimed that these members may be handled without danger of breaking. It will appeal to the owner who repairs his own car as the rings may be held securely when replacing a cylinder without danger of pinching the fingers. The device resembles a pair of pliers and its ends are so constructed that they will fit any type of ring. In practise the ends of the tool are fitted to the ring and when the jaws are expanded the ring may be removed easily. The replacement is also a simple matter.

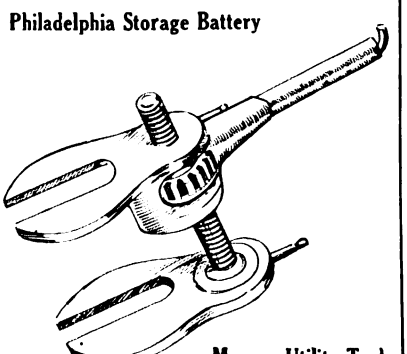
★



The Crary Self-Starter, made by the T. C. F. Manufacturing Company, Detroit, differs from those of ordinary form, inasmuch as the acetylene may be admitted to both the cylinders and the intake manifold. The flow of the gas and the proportions thereof are controlled by a special distributor and the needle valve member is included in the dash device. The latter is equipped with two levers, these serving to operate the needle valve and distributor. The smaller member is removable, locking the device. It is pointed out that the gas may be shut off from the dash as well as the amount regulated to secure a proper mixture.



Victor Grease Gun



Sword Piston Ring Holder

Crary Self-Starter

Philadelphia Storage Battery

Morgan Utility Tool

★

The Philadelphia Storage Battery is a new product of the Philadelphia Storage Battery Company, Ontario and C streets, Philadelphia, Penn., and was designed especially for motor car service and for utilization both for ignition and lighting. A feature of the battery is the use of thin plates, an arrangement decreasing the weight of the cells, and it is claimed by the maker that the amperage capacity is augmented. They are made in three types, the ampere-hour capacity being 54, 72 and 90, respectively, and the voltage six, which is standard. These batteries are very compact for a given capacity, the smallest member being approximately eight inches high, six wide and eight long. The largest battery is of the same dimensions except length which is 13 inches. They are fitted with neat handles, facilitating the replacement and removal of the member and the terminals are easy of access and non-corrosive.

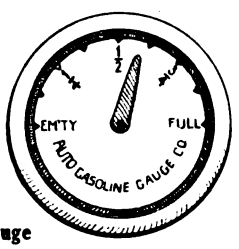
★

The Morgan Utility Tool is manufactured by B. Morgan, Newport, R. I., who has placed upon the market a number of practical accessories. It is a useful device inasmuch as it may be utilized for a number of purposes in the repair shop and garage, or upon the automobile. It comprises two slotted jaws, one of which is securely fastened to a threaded bolt while the other member is actuated by a ratchet. This arrangement permits of contracting or compressing the jaws when removing or replacing valve springs or stretching these members. Another use to which the tool may be put is that of holding patches on an inner tube, and it may also be attached to the running board and employed as a vise. In the repair shop it serves as a drill, jig and many other useful purposes.

Digitized by Google

The Auto Wash Brush, marketed by the I. J. Smith Manufacturing Company, 4241 Park avenue, New York City, is designed more especially for owners who take care of their own cars, although it is constructed for garage service as well. The brush is made of a high grade soft hair through which the water passes, keeping it clean, as well as insuring a constant flow of fluid upon the part being washed. It is fitted with a special coupling to which the hose is attached and the connection also forms the handle. Extra brushes may be purchased.

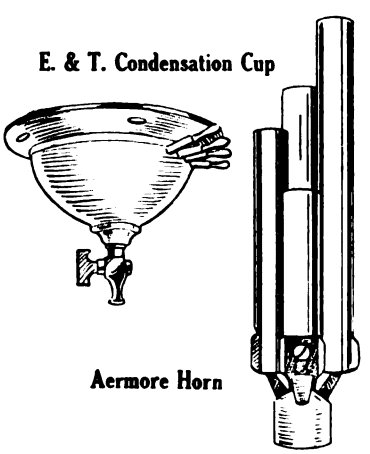
★



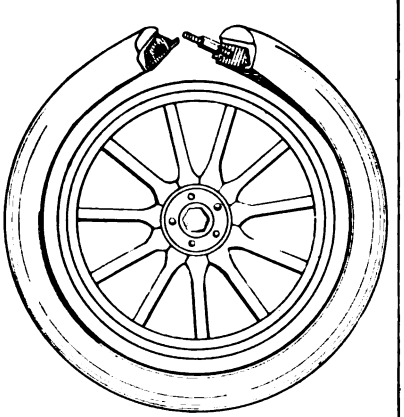
The E. & J. Condensation Cup is a device produced by the Edmund & Jones Manufacturing Company, Detroit, for attachment with the generator or gas tank, and by it all moisture is collected before it has an opportunity of reaching the acetylene burners. It is compact and easily installed, and is provided with two intake connections and a like number of outlets. It is placed below the generator or tank and any fluid that may collect is drained easily by the opening of a petcock with which the cup is provided. It is constructed of high grade material and is inexpensive.

★

The Auto Gasoline Gauge is being placed upon the market by the Specialty Sales Company, Racine, Wis., and is designed for attaching to the fuel tank to denote the amount of gasoline in the container. It is very compact and it is claimed that it may be installed in 15 minutes by the utilization of the special tool which accompanies each device. It comprises a metal tube which extends from the top to the bottom of the fuel tank, a float and a gauge. The casing has a spiral slot extending from top to bottom, half way around its circumference. This slot engages with arms on the float which slide freely on a straight staff. The latter is pivoted at either end of the casing, and at the upper end is an indicating hand which records the movement of the float below. The casing also serves to prevent the slopping of the fluid and disturbing the operation of the float. When the gauge is installed in the tank the dial lies in a horizontal position close to the surface and it is said that a perfectly steady reading is given by the indicator. The dial is calibrated, denoting empty, full and intermediate positions.



Smith Auto Wash Brush



Auto Fuel Gauge

E. & T. Condensation Cup

Aermore Horn

American Emergency Tire

★

The Aermore Exhaust Horn is manufactured by the Aermore Manufacturing Company, Chicago, and it is claimed that its construction is such that it will not become clogged with soot and that it will clean itself automatically. It comprises four brass tubes having apertures and constructed on the principle of an organ. It is operated by the exhaust of the motor and may be attached to any convenient point of the exhaust pipe. A special tail-end valve is supplied if desired. The signal is operated by pedal and it is claimed that the horn produces the four major notes of the scale simultaneously and that the volume of sound is controlled easily.

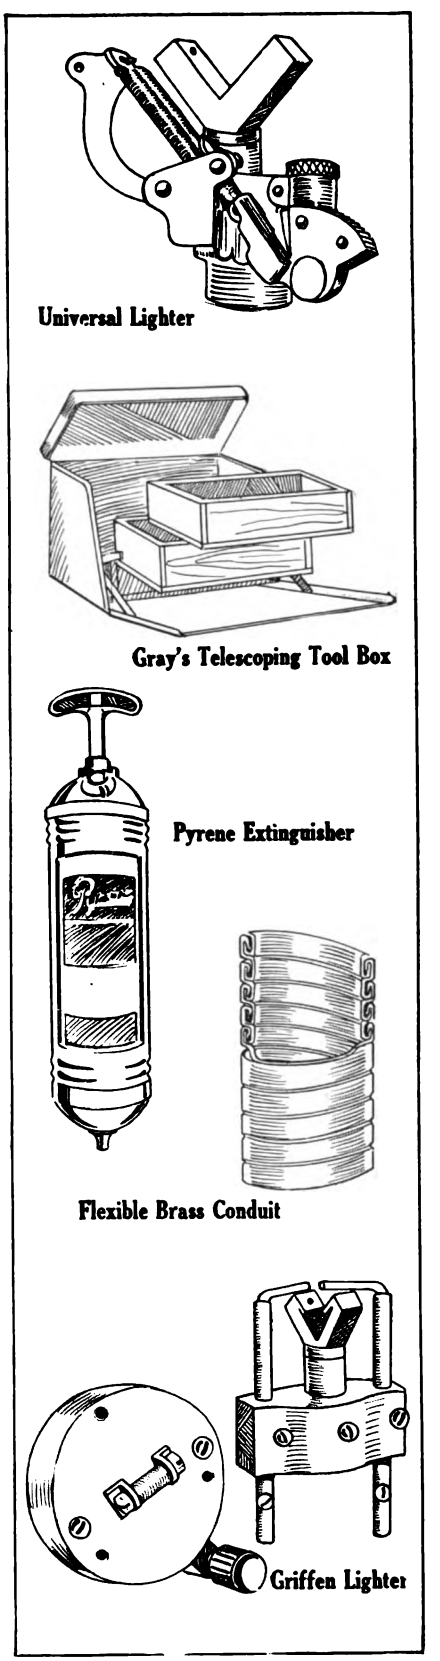
★

The American Emergency Tire, marketed by the American Automobile Specialty Company, 510 Ashland boulevard, Chicago, is as its name implies, an emergency shoe for replacing a blown-out or badly damaged pneumatic tire while on the road. It consists of a length or strip of solid rubber tire material perfectly conformed to the shape and size of the channel of any given wheel. It is reinforced internally, with high carbon steel wires and these are welded at their ends to two steel plates which form parts of a turnbuckle. The tire is made tight and secure in the channel, between the rims of the wheel, through the action of the right and left hand threads of a double screw engaging in each end plate The lateral strain is on the rims of the wheel. The turnbuckle is hidden from view and its arrangement permits of the two ends of

Digitized by Google

the tire being joined closely and without a projection.

★



The Universal Lighter differs from those of usual construction, as by it the acetylene headlights may be lighted by a simple movement of the finger. It does not require any wiring or batteries, the spark being generated by a friction file passing over a sparking alloy, the movement throwing a shower of sparks directly into the path of the flame. It is claimed that the sparking alloy will endure over six months and it is enclosed in a small thumb nut with spring tension to keep it automatically in proper adjustment until worn out. The sparking attachment is sold separately, and costs but a few cents by the dozen. The lighter is clamped around the base of the burner and is so constructed that it will fit any type of burner. It is marketed by the Waite Auto Supply Company, Providence, R. I.

★

The Gray Telescoping Tool Box, manufactured and marketed by the Gray Specialty Company, 148 Avon avenue, Newark, N. J., is a practical device for the automobile as its construction is such that any tool may be secured easily without disarranging the other members. This is of value on the road as considerable time is saved, and another advantage is that the tools are always in sight. The front and top of the box are hinged and the drawers swing outward, permitting easy access to the contents. The container is constructed of heavy gauge steel, and is 16 inches long, 10.5 high and eight wide. The compartments are of wood, preventing rattling of the tools. The device is equipped with a substantial brass trunk lock and the exterior is highly finished.

★

The Pyrene Fire Extinguisher is a compact device designed for attachment to the automobile, being 14 inches long and but three in diameter, and weighing only five pounds. The contents are impervious to heat or cold and it is claimed will not freeze at 60 degrees below zero, Fahrenheit. The liquid is not maintained under pressure, is proof against explosion, and will not deteriorate with age. Containing neither acids, alkalis or salts it will not injure any material with which it is brought in contact. The Pyrene Manufacturing Company, New York City, has designed a holder for attachment to the dash. The device itself is finished in enamel, brass or nickel.

Universal Lighter

Gray's Telescoping Tool Box

Pyrene Extinguisher

Flexible Brass Conduit

Griffen Lighter

★

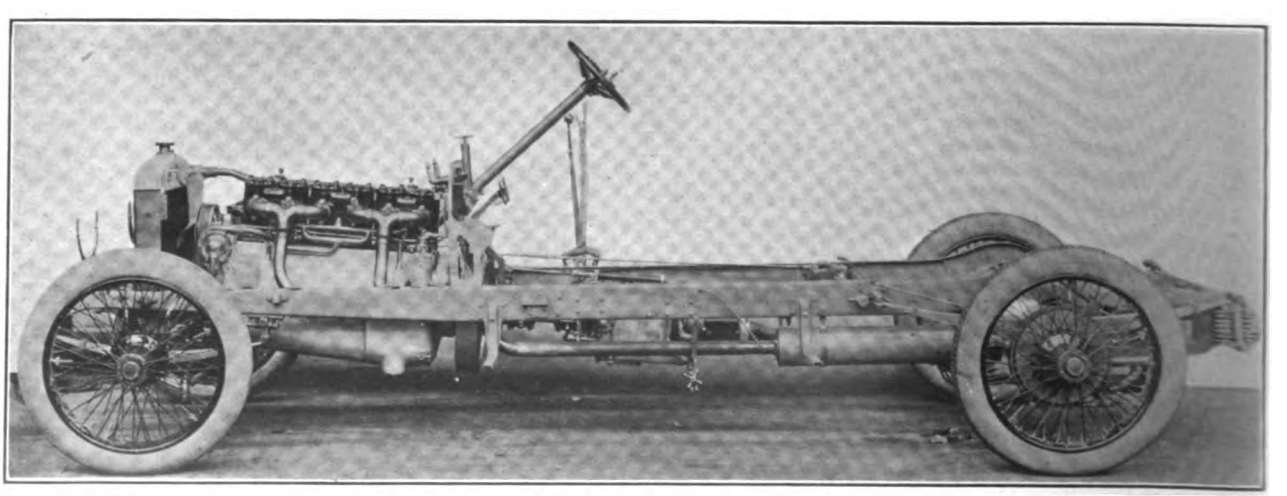
A Flexible Brass Conduit for covering the exposed wiring on motor cars or protecting gas tubing, etc., is manufactured by the American Metal Hose Company, Waterbury, Conn. It is made either of brass or steel and the metal strips are interlocked by a special process. The tubing may be bent to a considerable angle without affecting the joints. It is made plain or lined with asbestos, in different finishes, and is produced in various sizes to meet the requirements of the purchaser.

★

The Griffen Lighter is the invention of Stephen J. Griffen, 306 Linwood avenue, Bridgeport, Conn., who devised it for application to his single-cylinder car. It comprises a switch having a spark gap and a bracket for attachment to the acetylene burner. The burner device has two points in proximity to the path of the flame. When the switch lever is moved, the direction of the secondary current is changed so that it makes the circuit of the spark gaps at the burners, returning to the spark gap on the switch, and thence to the plugs as usual. The current to the plugs is interrupted but for the fraction of a second and the maker claims it does not interfere with the operation of the motor, also that the lighter is adaptable to any type of internal combustion engine.

Digitized by Google

A British car which holds much of interest for American motorists is the Daimler, made by the Daimler Motor Company, Ltd., Coventry, England. This is due in a measure to the fact that this concern was one of the first foreign makers which gave encouragement to Charles Y. Knight, inventor of the Knight sliding sleeve engine. All Daimler models are now fitted with this motor, and the company states that it has found it necessary to increase production facilities in order to take care of the rapidly growing demand.



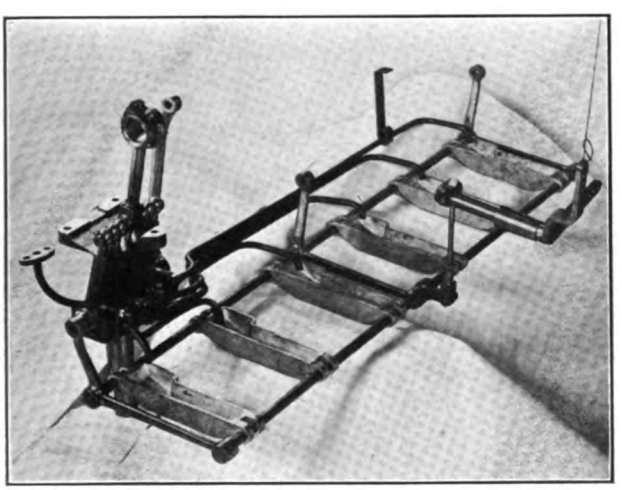
Two models are presented for the current season, these being identical in their main details, with the exception that the one shown herewith is fitted with a six-cylinder motor, while the other employs a four-cylinder unit. The design of the chassis and bodies is held to be sound in every respect, and it is stated that a judicious employment of special materials has resulted in fairly light weight, yet with sufficient strength and rigidity for all ordinary purposes.

The engine has the cylinders cast in pairs, the bore being 3.14 inches and the stroke 4.02 inches, giving a rating of 30 horsepower, according to the maker. Detachable heads are fitted, the water jackets in these being supplied from the cylinder jackets by an internal connection which dispenses with the necessity for external piping. With this new arrangement, it is claimed that all possibility of water leaking into the cylinders has been eliminated.

A water pump of the centrifugal type is provided to keep the water in circulation. This pump and the dual magneto are driven from a cross shaft placed transversely at the front of the engine, and actuated by spiral gears from the eccentric shaft. A silent chain is used to transmit the motion from the end of the crankshaft to the eccentric shaft. No change has been made in the design of the sleeves and actuating gear, this portion of the Daimler-Knight engine having proved itself to be quite satisfactory and free from trouble.

Each pair of cylinders is connected by an inlet pipe branch to the carburetor, which is of an improved type, designed especially with a view to economy of operation. On the opposite side of the engine a separate exhaust port for each cylinder communicates with the large muffler which lies along the rear portions of the frame. At all speeds the operation of the exhaust is held to be quite inaudible.

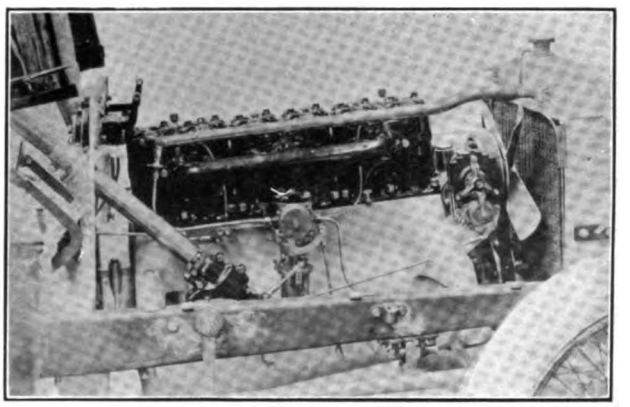
In the matter of lubrication, the design of the engine has been modified so that the pump, troughs and all parts of the system are connected to the top por-



Six-Cylinder English Daimler Chassis, Fitted with Knight Sliding Sleeve Motor, Worm Drive and Several Exclusive Features.

Digitized by Google

tion of the crankcase, the bottom half acting only as an oil reservoir. It will be remembered that the Daimler oiling system employs a large plunger pump to draw the lubricant, which has been filtered previously, out of the base and force it along separate leads to a series of troughs placed beneath each connecting rod. As the crankshaft revolves, the scoops on the bottom of these rods splash the oil to every bearing. An additional refinement is provided by hinging the troughs and connecting the actuating lever to the throttle control, so that the level of the oil is raised whenever the throttle is opened. In this manner the supply of oil to the motor is varied automatically with the work it is expected to perform. In practise, this system is said to have worked out decidedly satisfactorily, it being found necessary to renew the supply by pouring in a gallon of oil only every 600 to 800 miles, according to the size of the motor. The customary sight gauge is located on the dash.

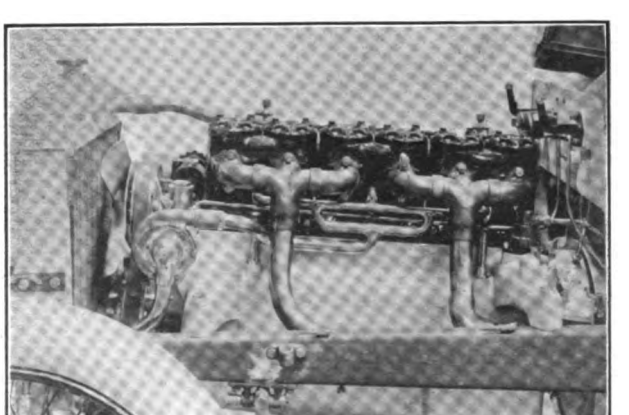


On these new engines the patented Daimler "vibration damper" is fitted to prevent the occurrence of the periodic tremor to which all fast running crankshafts are liable. This device is said to have demonstrated its value in this work, and the Daimler engines are claimed to be vibrationless at all speeds. Another special device is an air pump of improved design and with vertically placed valve, by means of which fuel is forced from the rear tank to the carburetor.

Special Oiling System Employed on Daimler Cars.

The clutch is a leather faced cone member, fitted with a new form of balanced flexible coupling to the gearbox. Four forward speeds and reverse are provided. A special sliding universal joint is placed behind the gearbox so that the rear flexible joint has no sliding motion. This rearrangement is held to give much smoother running on rough roads.

Final drive is by worm gears of special construction, the worm being placed below the axle. To reduce the amount of work imposed upon the universal joints, the engine and gearbox are slightly inclined, so that the drive from the crankshaft to the worm shaft is in a straight line under normal load.



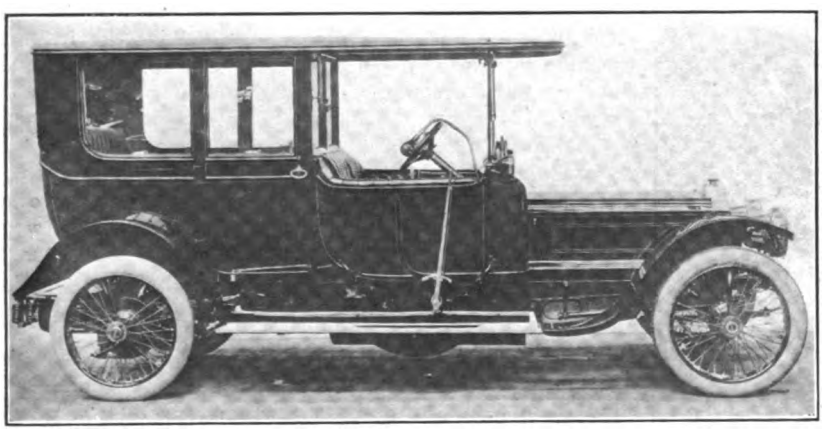
Right Side of Daimler-Knight Six-Cylinder Motor.

Two sets of brakes are fitted, both being of the external band type. The foot actuated member is located on the rear wheels and the hand brake on a drum at the rear of the gearbox. Semi-elliptic springs are employed, both front and rear. Swivel shackles at the back ends of the front springs relieve the frame of side stresses, and auxiliary spiral springs are fitted at the rear. Detachable wire wheels are supplied as standard.

A complete range of open and closed bodies is provided for each type of chassis, the open bodies comprising two-seaters, flush sided and torpedo styles, while the enclosed cars include the coupe and two special forms of low built landaulet and limousine. The landaulet is shown herewith, and it will be noted that the seating arrangement provides for four persons in the interior, with one beside the driver. The upholstery, the various fittings and the workmanship and finish are of the highest quality.

Another detail of importance is the method employed for attaching the Daimler bodies to the chassis. It is the usual coach building practise to affix the body rigidly to the chassis frame, with the result, according to the Daimler company, that when the frame becomes distorted by continual use over rough roads, the body becomes strained and creaks and rattles are set up.

Left Side of Daimler-Knight Six-Cylinder Motor.



Digitized by Google

With the Daimler, the body is hinged at the rear and at the front it is bolted down on rubber buffers.

The dashboard is a part of the chassis. The front of the body fits into place over the dash, but without having any fixed connection with it. Felt lining is, as a matter of fact, packed in between the adjacent parts, but this does not prevent relative motion. Therefore, it is claimed, that if the frame becomes deflected by the passage of the road wheels over obstacles, the body is not affected at all, and as a result all troubles in the way of rattling or of doors becoming tight are obviated.

———★———

A campaign for good roads, which is producing results, is being conducted in Ireland. The Roads Improvement Section of the Automobile Association and Motor Union in the country controls 21 committees in various counties, the 21st being inaugurated recently at Mallow. At a recent meeting in the latter place the subject of good and bad roads was discussed, the Irish manager of the association delivered

Earlham Type Landaulet Body on Six-Cylinder Daimler-Knight Chassis.

an address and there was a ready response to the appeal for voluntary support of the movement to effect an improvement in Irish road conditions.

——— ★ ———

While wire wheels are more generally employed on foreign cars it would appear that the relative merit of these when compared with American wheels of best second growth hickory is still a matter of some doubt. Recent tests were conducted by Rudge-Whitworth, Ltd., Coventry, England, in which the wire wheels made by that concern were pitted against two of the American product, two of French manufacture and two made of steel plate to represent wooden members.

The method of conducting this test was by means of a massive pendulum, 11 feet long, the "bob" of which weighed 480 pounds. This pendulum was allowed to swing over measured arcs against the rim of the wheel mounted on a dummy spindle, which in turn was part of a massive steel bar secured to a concrete monolith. Five blows were struck and the result of each blow and total result are shown by the following tabulation:

Permanent Deflection in Inches.

Blows——1	2	3	4	5	Total
American A..... .21	.32	.84	1.41	2.20	4.98
American B..... .28	.46	.67	.89	1.17	3.47
French A..... .25	.41	.64	1.07	4.60	6.97
French B..... .27	.45	.84	4.88	...	...
Steel Plate A..... .53	1.05	1.60	2.17	2.79	8.14
Steel Plate B..... .59	1.06	1.60	2.14	2.80	8.19
Rudge-Whitworth A..... .31	.55	.82	1.18	2.56	5.42
Rudge-Whitworth B..... .36	.60	.90	1.16	1.49	4.51

It would appear that the American wood wheels were quite the equal of the wire members in this respect. However, the damage done on each blow must be taken into consideration, as follows:

American A—First, none; second, one spoke cracked; third, rim moved; fourth, rim moved, quarter of felloe split, three spokes broken; fifth, felloe smashed.

American B—First, none; second, two spokes cracked; third; flange cracked; fourth, four spokes cracked; fifth, two bolt heads cracked, rim held.

French A—First, four spokes cracked; second, none; third, five spokes cracked; fourth, seven spokes broken; fifth, smashed.

French B—First, three spokes split; second, six spokes broken; third, one spoke broken; fourth, smashed.

Steel plate A—First, none; second, none; third, none; fourth, none; fifth, hub buckles.

Steel plate B—First, none; second, buckled at hub; third, no welding defects; fourth, none; fifth, hub badly buckled.

Rudge-Whitworth A—First, none; second, none; third, none; fourth, five spokes broken, two nipples pulled through; fifth, two spokes broken, two nipples pulled through.

Rudge-Whitworth B—No damage throughout.

The international tour from Budapest to Constantinople, which has been arranged by the Royal Hungarian and Roumanian clubs, has been supported by the Bulgarian and Turkish governments. The contest, originally planned for June 14, has been postponed to June 27, owing to the Austrian Alpine tour. The trip will finish at Xalewo, a very popular seashore resort, where the competitors will be guests of the Kur management and of Prince Rechid Benaid, to whose initiative this interesting competition is due. The programme follows: June 26, weighing in at Budapest; 27, Budapest to Kolozsvar, 450 kilometers; 28, Kolozsvar to Tusnad, 325; 29, Tusnad to Bucharest, 200; 30, rest day; July 1, Bucharest to Tirnovo, 165; 2, Tirnovo to Adrianople, 330; 3, Adrianople to Constantinople, 230.

The trade in motor cars in Java is increasing steadily. Moderate priced cars are most in demand, but practically every class, with the exception of the high priced, is saleable. The importation of motor vehicles for commercial purposes is small and does not seem to increase materially.

★

An accompanying illustration presents two Waverley electric cars, made by the Waverley Company, Indianapolis, Ind., which met recently in the Philippine Islands, under somewhat unusual circumstances. Having occasion to visit these insular possessions of the United States, an American woman shipped her Waverley phaeton to Montalban, Province of Luzon, where she anticipated enjoying two weeks of touring among the mountains of that district.

Soon after her arrival, she took a friend for a short drive and was more than surprised to meet another Waverley on one of the beautiful mountain roads near the town. Investigation revealed the fact that it was a model 60 surrey, selected by its owner because of its solid construction and its large seating capacity. This man is interested in a land and development company and uses his car for conveying prospective investors from the railroad to his various estates.

Two Waverley Electric Cars Meet under Unusual Conditions in Philippines.

The Brooklands Whitsun meeting in England was one of the most successful, in a long series, ever held. The weather was of the best, and a large gathering of enthusiasts watched the races, in a number of which the finishes were close and exciting. The results follow:

Whitsun private competitors' handicap, 5.75 miles—First, O. D. Pollak, S. C. A. R.; second, E. Horniman, Gregoire; third, F. W. H. Farquharson, Sunbeam; speed, 65.75 miles an hour.

Fifth 100 mph short handicap, 5.75 miles—First, H. A. Arkwright, Benz; second, Alan Mander, Mercedes; third, R. B. Whitehead, Berliet; speed, 95.75.

Fourth 70 mhp long handicap, 8.5 miles—First, H. M. Bowden, Vivinus; second, E. Horniman, Gregoire; third, G. W. Hand, Calthorpe; speed, 59.25 mph.

Fifth 100 mph long handicap, 8.5 miles—First, Gordon Watney, Mercedes; second, Farquharson, Sunbeam; third, Lambert, Austin; speed, 77.25.

The Ford car race, two miles—First, J. Coulthard-Bate; second, W. H. Reid; third, W. Mermod; speed, 54.75.

Fifth 70 mph short handicap, three miles—First, E. Horniman, Gregoire; second, J. E. Lambie, Bedford; third, O. D. Pollak, S. C. A. R.; speed, 64.5.

Whitsun handicap sprint race, two miles—First, Alan Mander, Mercedes; second, A. H. Arkwright, Benz; third, Gordon Watney, Mercedes; speed, 84.5.

The Bedford car, winner of second place in the Fifth 70 mph short handicap is the English product of the Buick Motor Company of Flint, Mich.

★

The 93rd entry in the Austrian Alpine tour, in which more than 100 cars were to contest, was a Ford, made by the Ford Motor Car Company, Detroit, Mich. The machine was to be driven by V. Stuart.

★

The first motor car trip entirely across the continent of Australia has been accomplished by Francis Birtles, who drove his 10 horsepower Brush, made by the Brush Runabout Company of Detroit, Mich., a constituent of the United States Motor Car Company, from Perth to Sidney. The distance is 2600 miles and was covered in 28 days and two hours. Efforts to cross Australia by motor car have been as numerous and as vigorous as some of the ocean-to-ocean trips in America. No less than a dozen attempts were unsuccessful and until Birtles succeeded, the journey was regarded as impossible.

TIMKEN MEN MEET.

The sales and advertising forces of the Timken Roller Bearing Company and the Timken-Detroit Axle Company met at the Detroit offices recently for their third quarterly conference. An all day business session was followed by luncheon and an evening at one of Detroit's leading theatres. Among those present were E. W. Lewis, Heman Ely, H. W. Alden, F. C. Gilbert, A. R. Demorey, C. E. Gordon, P. W. Hood, E. B. Lausier, P. W. Doyle, Harry J. Porter, R. B. Weaver, C. W. Dickerson, E. A. Walton, John Hanlon, George Beadell, F. G. McClurg, W. A. Sharon and Myron Townsend.

INSTALLING A PIT IN GARAGE.

There is a growing tendency among the class of motorists residing in the suburbs to erect a small garage on the premises, an arrangement that makes for convenience and economy. Many residents of the city also have their garages and it is surprising to note the large number of owners who care for their own machines, many of these being quite proficient in maintaining the automobile in proper running condition.

While there is considerable repair work that may

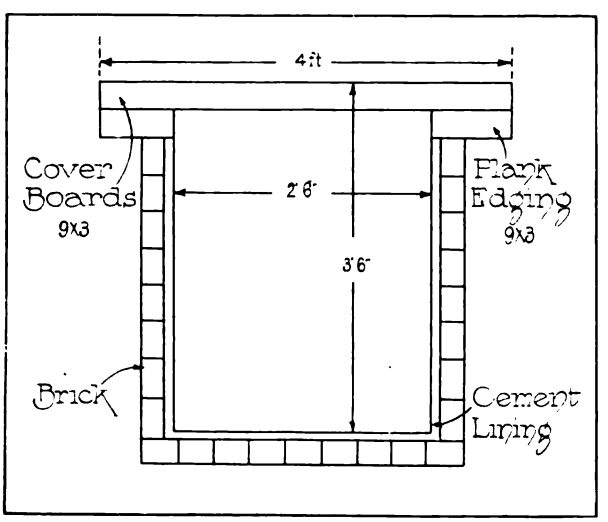

Fig. 1—Outlining Working Plan of a Brick and Cement Pit for the Private Garage.

be accomplished successfully without a pit, one of these is a valuable addition to the equipment, as by it many adjustments may be made easily without lying upon the floor. In taking up connecting rods and main bearings, the pit will be appreciated, for when properly designed the work may be performed comfortably. In disassembling the steering mechanism, and when the post must be removed, it is difficult to handle this member on some cars without a pit.

At Fig. 1 is presented a working plan for a pit, the dimensions and material being outlined, and while at first glance it may appear to be expensive, it could be constructed at a reasonable figure. The design outlined, however, has the advantage of being very durable and easily cleaned.

Although the depth may be altered to suit the height of the workman, that given in the drawing is three feet six inches, which is an average of the standard pits. A width of two feet six inches will be sufficient to permit of moving about without undue cramping while the length may be about four feet.

The retaining wall is made of ordinary brick, laid flat, and it is erected to within six inches of the floor level. The bottom of the pit is also of brick. After the mortar has set, the pit is lined with any durable cement. Planks, nine by three inches, are utilized to form the support for the cover boards which are also of the same dimensions. These boards are secured together and a ring fitted to enable the cover to be removed and replaced. The cover should be flush with the garage floor.

Another method is to make a box of heavy planking of the above dimensions and paint the outside with a creosote preparation to preserve the wood against the attack of moisture. A design of this type could be constructed easily and without expense and the interior cemented.

FITTING AN AUXILIARY LUBRICATOR.

To obtain maximum efficiency from the internal combustion motor the working parts must be lubricated properly. Too little oil results in seized bearings, burnt connecting rod bearings, scored cylinders, etc. On the other hand too much lubricant causes heavy deposits of carbon, and this material breeds trouble in the shape of poor compression, heating and knocking.

This is especially true of motors in which means are not provided for maintaining the level of the lubricant in the crankcase. If the operator of the car would observe the instructions of the maker, such systems are efficient and give no trouble, but unfortunately many motorists are careless in replenishing the supply of lubricant, and acting upon the belief that if a little oil is good for the engine a large quantity will improve it, flood the crankcase.

Digitized by Google

For example: The model T Ford oiling system is provided with two petcocks, one of which is fitted for denoting the proper height of the oil. If upon filling the crankcase the operator observes the instructions of the maker, the motor will be properly lubricated and there will not be an excess of lubricant. Very few owners, however, observe the rule and guess at the amount of lubricant poured into the crankcase.

It is obvious that under such conditions the fitting of an auxiliary oiler will be of service, inasmuch as the device may be so regulated as to feed lubricant so that the proper level will always be maintained. Such an equipment was noted by the writer recently and the owner who attached the device has operated his machine several thousand miles without having to give the motor any other attention than that of occasionally cleaning out the crankcase and refilling to the proper height.

The device and manner of installation are outlined at Fig. 2, and the complete outfit is very inexpensive and may be fitted without any alterations to car whatsoever. As will be noted the equipment is simple, comprising an ordinary gravity feed oiler and a piece of copper tubing. The lubricator is of the type commonly employed on machinery and marine engines and consists of a large glass shell with a metal top and bottom, these parts screwing together and locking the glass securely. The lower section of the oiler has a sight feed glass through which the dripping of the oil may be noted, while the upper portion has a small handle, the moving of which actuates a needle valve, opening or closing an aperture through which the lubricant drops.

From the lower part of the oiler is fitted a reducing union to which is attached a copper tubing, this being led through the dash to the breather. It is an easy matter to secure the device to the dash and in the design noted by the writer, the lubricator was fastened by a small metal strap which was screwed to the dash.

How It Is Operated.

The oiler is equipped with a knurled nut by means of which the drip of the lubricant may be so adjusted that the liquid will flow in a stream or a few drops a minute. As the device operates by gravity, it is essential that the handle be straightened when its service is required and the supply shut off when the motor is not running. Being on the dash and in view of the driver at all times, it will be noted readily whether or not oil is being fed to the crankcase. In regulating the oiler it should be so set that enough will be fed to keep the level denoted by the maker of the machine and the amount is determined easily by a little experimentation.

The device may be procured in sizes sufficiently large to operate the car a considerable distance, and it is an easy matter to replenish the supply. Being in plain view at all times there is no guess work as to whether the member is working or if there be a supply of oil.

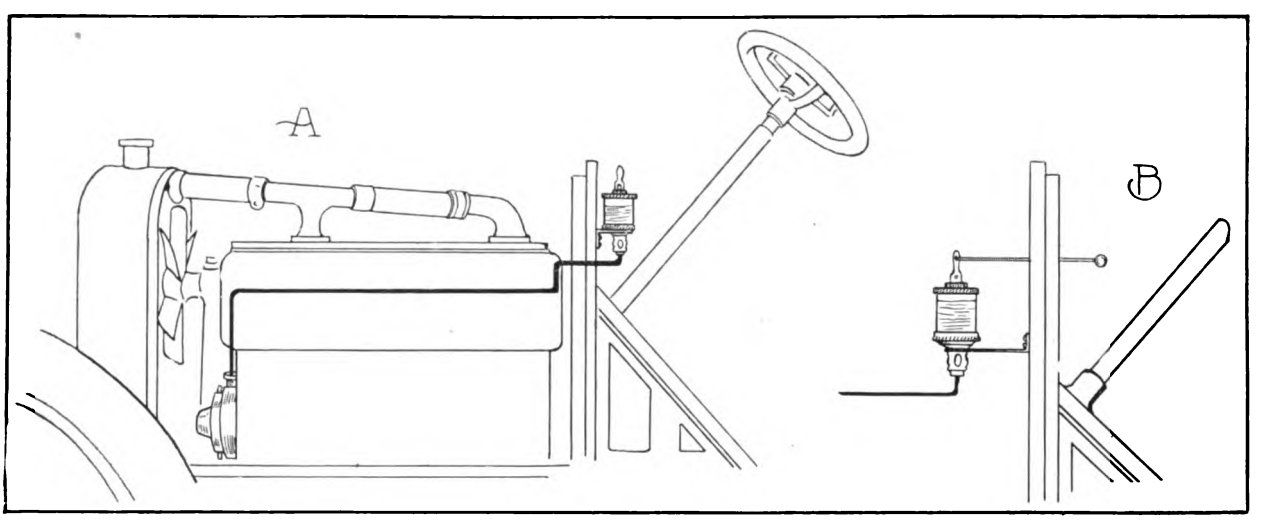

Fig. 2—Method of Feeding Lubricant to Crankcase by Gravity: A, Denoting Location of Device on Dash and Connections to Breather; B, Suggestion for Mounting Inside of Hood.

At B is suggested a method of mounting the device inside the dash and fitting a small lever having a ringed handle. The rod should be secured to the handle of the oiler by a ball and socket joint or pivotally mounted to allow its operation. The method of supporting the lubricator is also outlined. It could be mounted in proximity to the breather and a short pipe employed to convey the oil, this depending upon convenience. The latter method would require lifting the hood or the fitting of the lever attachment, a design which would require a long rod.

The oiler could also be utilized to convey lubricant to a bearing where provision is not made for oil; in fact, it could be applied to any part where friction develops.

MAINTAINING FLOW OF FUEL.

One of the essential factors for proper carburetion is a steady flow of the fuel to the vaporizer. When this member is starved of gasoline the efficiency of the motor is impaired, a condition that is apt to lead the operator to suspect that the ignition is faulty in its operation. With pressure feed, grades may be surmounted easily if the system be air tight and the pump operating properly, but when the fuel is led to the carburetor by gravity, it is important that the tank be at a sufficient height to supply the vaporizer with fuel at all times.

The popularity of the roadster has led many owners to convert touring cars into this type, and in cutting down the height of the seat to obtain a racy appearance, the location of the fuel container is changed to the rear of the machine. Round or oval tanks are generally fitted and if the wheelbase of the motor car

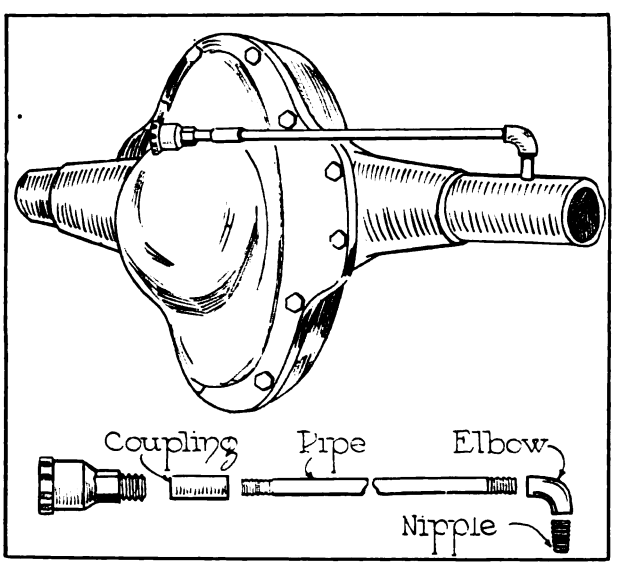

Fig. 3—A Grease Cup Kink for Making Easy the Lubrication of Inaccessible Parts, Showing How the Device Is Installed, the Material Utilized and How Assembled.

be long, it necessitates mounting the tank at an unsightly height to obtain a proper flow of fuel when ascending hills.

An installation which permits of the fuel container being mounted at a reasonable elevation above the vaporizer is made easily and is depicted at Fig. 4. It will be noted that when the car is on the level, as shown at A, the gasoline will keep the carburetor well furnished with fuel. But in climbing a steep grade the supply will be cut off because the vaporizer will be higher than the tank, as illustrated at B.

Fitting Auxiliary Tank.

A simple method of overcoming this difficulty is presented by a reader of The Autocar and the plan of fitting is shown at A. It consists of attaching an auxiliary tank, about nine inches long and four in diameter, under the bonnet in a convenient position near the carburetor. It is important that the bottom of this vessel be at least on the level with the top of the float chamber.

The connections are made easily and without any extensive alterations. Instead of main line being connected to the carburetor it is attached to the top of the additional tank and from the bottom of the latter is led another pipe which is fitted to the carburetor, the second tubing replacing the regular connection. The shut-off valve should be located in the line connecting the auxiliary tank and the carburetor, or in any other accessible place, this depending upon the design of the car.

As will be seen by the sketch, if the large tank be a few inches above that of the smaller member when the automobile is on the level, the auxiliary member will be filled while operating on level roads or down hill. Therefore, on a rising gradient and under conditions when the carburetor would be starved of a supply from the large vessel, the small tank will furnish the vaporizer with enough fuel to climb a grade several miles long. When level ground is reached again, the auxiliary member will be filled automatically.

It is advisable to provide a petcock in the small tank to prevent an air-lock when it is first filled, also to have an air vent in the regular tank. This system could be adopted with advantage on many cars having a gravity tank under the front seat, but the top of the extra tank should be at least level with the bottom of the larger member, while the former must be above the float chamber when the machine is standing on the level.

A TIRE REPLACEMENT SUGGESTION.

The experienced motorist does not relish the task of fitting a new shoe, especially if the tire be one of large dimensions. The rubber is stiff and it sometimes requires considerable exertion to fit the cover to the rim. Forcing it on with tire irons is poor practise especially in cold weather. A simple method is to warm the rubber which will make it flexible and easy to handle.

This is an easy matter if the new shoe is to be utilized in the garage as the bead and the cover walls may be sponged with hot water, taking care that none of the fluid comes in contact with the fabric. If a new tire has to be fitted on the road, remove it from the cover or wrapping and place it in the sun for a while. It will be found that it will become soft and pliable and the work of fitting will be made considerably more easy.

EVILS OF OVERLOADING TIRES.

Despite the fact that the manufacturers of tires have and are conducting a campaign of publicity to teach the motorist to care for his shoes properly, it is a question if over 10 per cent. of the owners

Digitized by Google

have any idea of the weight the tires were designed to carry.

Experiments conducted by the United States Tire Company, New York City, have proved conclusively that the life of overburdened tires is considerably shorter than it is where the designated carrying capacity is not exceeded. It is obvious, therefore, that the direct effect of overloading is to increase tire expense. The pertinent fact about overloading is that it breaks down the side walls of the casing, laying the foundation for a blow-out which is bound eventually to occur. By this time the casing is so badly damaged that it is beyond repair.

In order that motorists may know exactly how much of a load they have a right to expect their tires to carry, the company recommends the following table of weights in relation to tire sizes:

	Rear Weight a wheel	Front Weight a wheel
28 x 2.5	225 lbs.	275 lbs.
28 x 3	350 "	425 "
30 x 3	375 "	450 "
32 x 3	375 "	450 "
28 x 3.5	425 "	500 "
30 x 3.5	450 "	550 "
31 x 3.5	475 "	575 "
32 x 3.5	500 "	600 "
33 x 3.5	525 "	625 "
34 x 3.5	550 "	650 "
36 x 3.5	600 "	700 "
30 x 4	625 "	750 "
31 x 4	635 "	775 "
32 x 4	650 "	800 "
33 x 4	675 "	850 "
34 x 4	700 "	875 "
35 x 4	735 "	885 "
36 x 4	750 "	900 "
40 x 4	850 "	1000 "
42 x 4	900 "	1050 "
32 x 4.5	750 "	950 "
34 x 4.5	900 "	1125 "
35 x 4.5	935 "	1175 "
36 x 4.5	975 "	1225 "
37 x 4.5	1010 "	1260 "
38 x 4.5	1050 "	1300 "
42 x 4.5	1200 "	1450 "
34 x 5	950 "	1200 "
35 x 5	1000 "	1250 "
36 x 5	1050 "	1300 "
37 x 5	1100 "	1350 "
39 x 5	1200 "	1450 "
43 x 5	1400 "	1550 "
37 x 5.5	1150 "	1400 "
38 x 5.5	1200 "	1450 "

WHY TIMER SHOULD BE CLEANED.

Where the car is fitted with a timer and coil and these comprise the ignition system with a battery or mechanical generator supplying the current, the commutator should be given attention in order to obtain efficiency from the motor. On some cars the device is not very accessible and some owners are apt to neglect the part.

Where it is not an easy matter to remove the cover of the timer, it may be cleaned by filling an oil can with gasoline and squirting the fluid into the member. It should be thoroughly flushed out to remove particles of dirt or metal that may have accumulated. After this operation the timer should be well lubricated with a light oil.

A GREASE CUP KINK.

Grease cups are now being fitted to parts which formerly were neglected in the way of lubrication except for an occasional oiling with the ordinary can. Some types of cars have grease cups in places difficult of access and when these members require screwing down the operator is obliged to reach under the chassis and assume uncomfortable positions, to say nothing of the danger of soiling the wearing apparel. At Fig. 3 is illustrated an easily made device, which is inexpensive, the material consisting of a piece of ordinary pipe, an elbow, coupling and a nipple in addition to the grease cup. The method of installation is shown in upper view of drawing.

To install the device the cup is removed and the distance measured from the part to be lubricated to

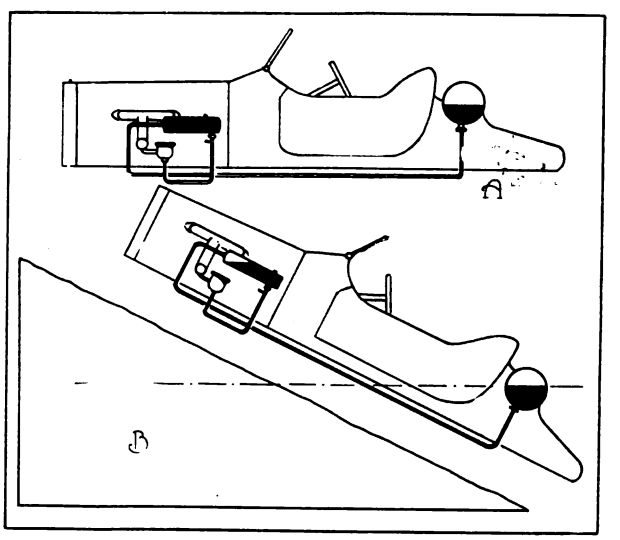

Fig. 4—Depicting Installation of Auxiliary Fuel Tank: A, Showing How Extra Container Is Filled by Gravity When Car Is on Level Ground; B, Illustrating Its Utility When Ascending Grades.

a convenient point of operation. A nipple is then screwed into the opening and the elbow attached. The stationary part of the grease cup is next fitted to the union and the latter screwed on the pipe. The material may be procured of any plumber or at a supply house. The pieces should be put together and the grease cup should be attached to make sure it will fit.

PITTSBURG GETS MOTOR APPARATUS.

Pittsburg recently awarded contracts for six motor fire trucks at $5250 each, three of the machines to be furnished by the Knox Automobile Company, Springfield, Mass., and six by the American-LaFrance Fire Engine Company, Elmira, N. Y. These firms are not the lowest bidders, but the other bids were disregarded by the city because the makers were not considered responsible in the sense in which the officials held the word.

SUCCESSFUL REMY SALESMAN.

The accompanying illustration is that of A. J. Rogers, who was recently placed in charge of the Remy magneto branch at 170 Golden Gate avenue, San Francisco. His territory will include the entire Pacific Coast, and his success with the sale of Remy products in other capacities, is sufficient guarantee that the business of the concern in that district will show a marked increase at once.

Mr. Rogers is well known through the Middle West and South, having been connected with the sales department of the Remy Electric Company, Anderson, Ind., for some time. Inasmuch as the home office is continually seeking men for the large number of factory branches and service stations it is establishing throughout the country, it follows that his work has been watched with interest by his superiors.

A. J. Rogers, Branch Manager, Remy Electric Company.

The San-Francisco branch is one of the most important in the country. The sale of Remy magne- and other ignition and lighting equipment in this district has been increasing very rapidly of late and it was deemed best to select a man for branch manager, who had given ample demonstration of his ability. That Mr. Rogers measured fully up to this standard is a source of much gratification to his many friends, both in and out of the industry.

AUTOMOBILES AT DALLAS CONVENTION.

The convention of the Associated Advertising Clubs of America, which was held at Dallas, Tex., recently, had as delegates many automobile advertising men, and as a matter of course, motor cars were used extensively. One of the remarkable events of the meeting, and one which attracted considerable attention, was the parade of the nearly 20,000 advertising men who were present. Instead of walking as the members of an ordinary convention would, they were carried in automobiles, and 3000 of them were used, headed by an official Cole press car and five other cars of the same make bearing the officers.

TESTS OF "ESSEN KAY."

The S. & K. Tire System Company, 2021 Michigan avenue, Chicago, maker of a new tire filler or air substitute which is called "Essen Kay," has reported some interesting tests of the subtance. It is an organic compound, the chief constituent being an oil and is vulcanized into a substance closely resembling rubber. In the tests, it was subjected to acids, of which only aqua regia had any effect. Alkali did not change it, nor did heat or cold. A portion was placed in an oven containing a crucible of lead, and heat applied until the lead melted, at a temperature of 625 degrees, Fahrenheit, without the compound being affected. It was frozen in a cake of ice, and boiled for several hours, coming through all these trials without losing any of its qualities.

THE INDUSTRY ABROAD.

During his recent visit abroad, Charles A. Trask, factory manager of the newly organized Henderson Motor Car Company, Indianapolis, Ind, maker of the Henderson car, studied the methods employed by the manufacturers of the Daimler, Wolesley, Napier, Renault, Clement-Bayard, Pipe, Metallurgique, Benz, Opel, and other foreign cars of note. Concerning the industry abroad, Mr. Trask says:

"Wire and other forms of metal wheels are becoming more generally used on the European products every day. This is partly due to the difference in atmospheric conditions, but from an engineering standpoint, the metal, and particularly the wire wheel, is being looked upon as a decided improvement. It is true that the quality of hickory obtainable in this country is better than the oak employed for building wood wheels in Europe. Still, I believe that the popularity of the metal wheel will increase swiftly in America also.

"Tense interest and attention is given to careful assembly by European manufacturers. The Renault people are building about 150 cars a week. Clement-Bayard, Daimler and Wolesley are releasing 50 cars each week, to accomplish which the two last named firms are employing 3500 men each.

"I found no European factory that made a practise of fitting bodies to all of its chassis. Many of them shipped as much as two-thirds of their product minus body and equipment, the coachwork being done in most cases entirely independent of the motor car factory.

"After perceiving the extremely high tensile strength of the materials they put into the makeup of high class European cars, in almost every case of more strength than our American products, I have concluded that we are slightly lax along these lines. I intend to make it my purpose in buying materials henceforth, to hammer home the idea that we must aim towards a higher grade of excellence and lasting qualities, if we are to keep up with the quality of motor car product built by our brothers across the water."

CORRESPONDENCE WITH THE READER

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Locating Noisy Tappets.

(1391)—One of the valve tappets of my machine is noisy and the clatter seems to be in one of the first two cylinders, but I cannot tell which. What is the easiest and quickest method of locating the faulty member?

A SUBSCRIBER.

Des Moines, Ia., June 12.

The tappet making the noise referred to may be located easily by closing the space between the tappet and the valve stem when the motor is running. At Fig. 1 A is illustrated the method of holding a thin strip of metal between the moving parts. The device is shown at B and it will be noted that the end is flattened to a tapering point. The tool is placed between the parts of the suspected tappet as outlined, preventing its operation. If it be the cause of the noise the motor will run quietly. Each tappet may be tested similarly.

Welding Steering Knuckle.

(1392)—Through an accident the steering knuckle of my car was broken. The agent advises me to replace the damaged part with a new one. Cannot the pieces be welded by the oxy-acetylene process, and would the part be strong and safe to use? H. N. M.

Portsmouth, N. H., June 17.

According to the manager of a large welding company the knuckle could be welded successfully and the writer is informed that as the place united is built up or reinforced, it will not break, also that the company has welded many knuckles and that none have broken. If the part is welded it could be tested for weakness by placing it in a vise and applying a bending strain. A new part would, perhaps, be more satisfactory as it is not possible to determine what stresses the old member was subjected to in the accident.

Gauging Lift of Valves.

(1393)—I have read that to secure the best results from the motor the valves should all have the same lift and that one lifting sooner or later than the others affects the running of the engine. How can the lift be measured so that each tappet may be set to a hair?

OWNER.

Brattleboro, Vt., June 18.

The lift of the valve is important, for if the opening be restricted the passage of the mixture and egress of the burnt gases will be impeded. This comes under the head of valve timing and it is essential that the valves open and close according to the timing of the motor, the number of degrees varying with the design.

The amount of lift may be noted by the application of the device outlined at Fig. 2, which is employed for setting valves and making adjustments in a repair shop. It may be made from sheet metal or any suitable pieces of old material. The indicating hand may be secured from an old clock or made from brass, the latter being preferable as it can be bent to drop over

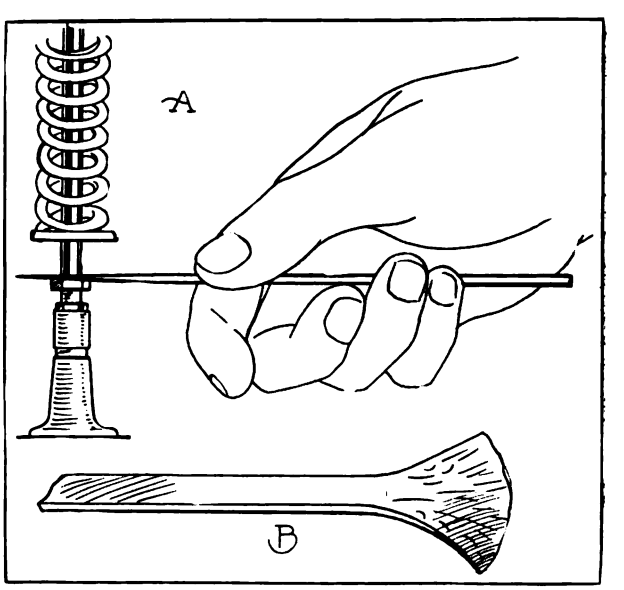

Fig. 1—Locating Noisy Valve Tappets: A, Method of Utilizing Tapered Strip of Metal Shown at B to Close Space Between Valve Stem and Tappet.

the cylinder walls surrounding the valve. A spring is fitted as illustrated to hold the needle member in normal position.

The device is placed upon the cylinder with the arm member in contact with the valve when the latter is closed. The position of the index finger is noted and the motor cranked slowly until the valve reaches the top of its stroke when by the graduated marks on the dial the lift may be noted easily. A piece of paper could be substituted for the marks and the opening and closing positions of the valve noted. Each valve may be tested in a similar manner and the actuating mechanism adjusted.

Digitized by Google

Mysterious Missing of Motor.

(1394)—I have a 1911 model T Ford which has developed a mysterious missing in the cylinders. At low speeds and when the clutch is not in, the engine will fire on all four cylinders, but when running on the high but three cylinders work. Have cleaned carburetor and adjusted coils, but the result is the same. It cannot be the valves for these were ground recently. This condition developed after the valves were ground. Have been told that the valves and springs sometimes cause this; that the intakes and exhausts are different. Can you advise me what is the trouble? FORD OWNER.

Providence, R. I., June 20.

The probable cause of the trouble is that the valves do not seat properly due to the tension of the springs. In replacing the springs it is likely that the intake and exhaust members were mixed. These are distinguished easily by the tension, the exhaust being considerably harder to compress. The writer has known of such intermittent skips in the motor which were due to the valve springs. They may be repaired by stretching. The valve stems should also be examined to note if they move freely in their guides, and if carbonized or dirty, they are likely

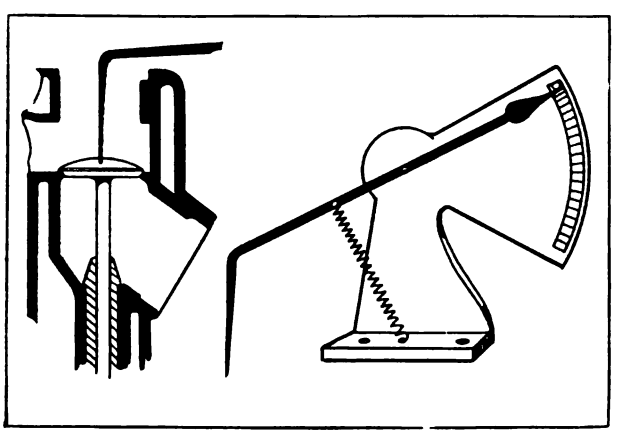

Fig. 2—Easily Made Device for Recording the Lift of Valves and Their Timing.

to stick at low speeds. In replacing these the stems should be well lubricated and care taken that the retaining collar does not bind.

Fixed or Variable Ignition.

(1395)—Am contemplating the installation of a magneto on my 1907 Oldsmobile and desire to employ a true high-tension instrument. I know where I can purchase a Bosch fixed ignition magneto at a reasonable price. A driver of experience informs me that a fixed magneto is all right for city work, but not for speeding. Which type would you advise? READER.

Woonsocket, R. I., June 16.

The fixed ignition magneto is utilized with success, but the writer believes that a variable instrument would give better results, where speed is desired. The instrument could be reconstructed so as to provide variable ignition and the work would be inexpensive. The Bosch Magneto Company, 225 West 46th street, New York City, could advise as to the cost.

Replacing Worn Cam.

(1396)—I have an old model motorcycle and the cam is worn so badly that I can get but little power from the motor as the valves do not lift high enough. I find that a new part cannot be obtained as the company is not in business. Am fairly good on ordinary machine work and wish to replace the worn part myself. What is the best and easiest method of doing the work?

MOTORCYCLIST.

Bath, Me., June 13.

Replacing a worn cam is a job requiring careful work, the best of material and an experienced repairman. As a rule in small air-cooled motors the cam is formed integral with the wheel, and both are hardened and ground. The method about to be described can be employed to advantage where a very worn cam has to be replaced or a higher lift is desired.

Assuming that the cam will require a .0625 or .03125-inch lift, the best method is as follows: Take the wheel with its cam and slowly heat it to a dull red, preferably in a charcoal fire. The slower it is heated the better. Allow it to cool in the ashes, after which it will be found soft enough to turn. Next, mount the wheel in a lathe, utilizing a three-jaw chuck. A strip of brass should be employed around the chuck to prevent its jaws injuring the teeth of the wheel. The cam is then turned or ground off until only the circular part remains, forming a true circle with the bore or hole through the wheel, or with the outside of the latter. In some instances it will be found an advantage to mount the wheel on a slightly tapered mandrel by driving it up on it and running the mandrel between the lathe centres. As soon as the cam is reduced to a circular form, it should be finished nicely with a cut of a fine finishing tool and with a very slight taper.

Next, take a piece of very tough bar steel, which, when quenched in water, will give a fairly hard surface. This should be bored when soft, and parted off the size of the bore to be such as to fit on the turned down end of the camwheel, but not to drive up completely on tapered part. It should be able to enter on the taper, and not go any distance along it. It is then taken off the chuck and mounted on a mandrel and run between the lathe centres. Each end should have a shoulder of about .015625 inch wide, representing the diameter of the turned down portion of the cam, and a top diameter equal to the diameter of the original height of the top of the old cam, supposing that the latter were a complete circle.

The shape of the cam is next filed carefully, leaving the shoulders circular, these being a guide for forming the circular part, and the metal for the shape of the cam. This can be set down easily from the old cam by tracing it on a piece of paper, marking around it on one side of the new cam blank. This will furnish a guide for the new part. After this is done, and the cam filed in a circular direction, it can again be mounted on the mandrel and the shoulders at each end turned off.

Having arranged the width of the cam to correspond with the length of the tapered portion left on the camwheel, that part of it where the cam comes should have a hole drilled about .1875 inch in diam-

Digitized by Google

eter, a similar hole being drilled in the camwheel and fitted with a fine thread screw. The outside end of the hole in the cam should be countersunk, and a screw should be provided that will pass through the camwheel and the hole in the cam easily.

The next operation is to shrink the cam on the extended tapered portion of the camwheel and the tapered part should be hardened by heating to a dull red and plunging it through a depth of about three inches of oil into cold water, the oil lying on the top of the layer of water in a deep vessel. About .1875 inch of the soft steel should be screwed to fit the hole in the camwheel, the projecting end being about .25 inch longer than the width of the cam. The latter is next heated to a red, and while in this condition is pressed over the tapered extension of the camwheel, the upstanding steel rod locating it in position. It can be easily pressed home between the jaws of a vise. This fitting should be done quickly and before the red heat is lost. It should then be plunged through the oil into the water, the same as with the camwheel. It will be found to be shrunk on tightly, provided the taper was slight.

A hardened .1875-inch screw is made to fit the hole in the cam and is next screwed through it into the wheel. It is advisable to tin the screw and opening, as by driving the screw in when the solder is soft, a secure job is assured. If the work is carried out properly, there will be no danger of the cam working loose. In most cases it will be necessary to make the cam of a larger diameter, even though its width is not increased in order to provide enough metal between the camwheel and cam to prevent its bursting or stretching. It is obvious that the length of the valve plungers will have to be modified after the work.

Taking Up Connecting Rods.

(1397)—How tightly should connecting rods be taken up on an old motor? It has babbitt bearings and these have become loose. Is there any danger of getting the bearings too tight? How can you tell when they are too snug or not tight enough? Will the motor have to be pulled down to do this work? The crankcase is in two parts and the lower is removable.

INTERESTED READER.

Montpelier, Vt., June 17.

Repairmen differ as to the snugness of bearings where babbitt metal is utilized. The writer believes in taking them up fairly tight and the work is performed by loosening the locking nut of the connecting rod bolt and removing the latter. If a number of small shims are fitted to the bolt one or more are taken out, the bolt replaced and set up tight and the rod tried for snugness. This is done by placing a rugged screw driver or any similar tool between the connecting rod and the throw of the crankshaft employing the tool as a lever to snap the connecting rod to and fro on the crankpin. If it moves freely, but not too easily, it may be assumed that the bearing is about right.

The bearings could be set up so tight as to cause trouble, but if the above directions are followed there should be no danger of burning the metal when the motor is started. This work may be performed by removing the lower half of the crankcase. Each connecting rod should be tested and adjusted. The connecting rod bolt should be set up snugly, the nut locked securely and a cotter pin employed. Before doing this work the crankpin and babbitt metal should be well oiled.

After replacing the crankcase it should be well filled with lubricant and during the first 50 miles or so the oilers should be adjusted to feed a little more oil than usual. The motor should be started up and run for a while, and then stopped and the operation repeated. This will work out the stiffness, and it will be found after the engine has been running for about 30 minutes that it will crank easily.

Starting Crank Broken.

(1398)—Supposing the starting handle breaks and it happens when you are miles from nowhere, as they say. How could the motor be started? CURIOUS.

Northampton, Mass., June 21.

There are several methods in a case of this kind. The simplest and easiest is to jack up one of the rear wheels, engage the high speed and let in the clutch. Throw on the switch and open the throttle as usual. Next, grasp the jacked-up wheel and turn in the same direction as the car would travel if it were running. It will be found that the crankshaft of the motor will be revolved as if it were cranked by the usual method.

Another way is to start the machine down a grade and after it is rolling fairly well, engage a speed and let in the clutch. If the flywheel is accessible it can be revolved by hand until the motor starts. The cylinders could be primed with gasoline and the spark switched on, but this method is not as reliable as the others mentioned. Of course, if the car was equipped with a self-starter any of these methods would not be necessary.

Larger Sized Tires.

(1399)—Am contemplating placing four-inch shoes on the rear of my model T Ford. Will the increase in size affect the motor; that is, will I be able to secure as much power as with the regular sized tires?

JOURNAL READER.

Bridgeport, Conn., June 19.

The fitting of a larger sized shoe on the rear wheels will consequently increase the diameter of the driving wheel, but this would be so slight that it is doubtful if the difference in the operation of the motor would be noticed. A little more power will be utilized, but the economy in tire upkeep as well as more comfortable riding qualities would more than offset any loss of energy.

Leo Ross recently returned to his home in Weehawken, N. J., from his third tour of Europe and the British Isles. Mr. Ross drove a Columbia-Knight car, purchased from the United States Motor Company of New York City. He covered 3200 miles, crossing numerous mountain passes and subjecting his machine to many severe tests, which it withstood in an exceptional manner.

THE AUTOMOBILE JOURNAL

VOL. XXXIII. JUNE 25, 1912. NO. 10.

Published the 10th and the 25th of Each Month.

William H. Black, Treasurer. D. O. Black, Jr., Secretary.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 W. 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4707 Magnolia Ave.
BOSTON—John W. Queen, 6 Beacon Street.

Subscriptions:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Ten cents the copy.

Advertising Rates:
Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.
Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.
Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

THE ANNUAL TOURING NUMBER.

The next issue of The Automobile Journal will be the sixth annual Touring Number. This announcement will be received with undoubted interest by a large number of motorists who have come to rely upon the authoritative information contained in this magazine. The increasing demand for information of this character has impelled the production of a much larger number than ever before, and the material will be such as to meet the requirements of modern touring conditions.

In keeping with this view, the sixth annual Touring Number will contain complete itineraries for at least three transcontinental tours, with suggestions for connecting these at various points across the country. The splendid touring country of New England and the East will be routed as completely as in years past. In addition, attention has been given to that increasing body of motorists who desire to enjoy the pleasures of touring in foreign lands. Canada, Great Britain and Continental Europe will be covered in the same thorough manner as the United States.

Other features will include a complete digest of the laws in every state in the Union, the necessary arrangements for preparing the car for the season's touring, suggestions as to what is needed in the way of accessories and conveniences, what to wear, shipping the car abroad, and all other touring information necessary to a thorough enjoyment of the vacation period. It need not be added that the regular departments and features will be included as well. Special attention also has been paid to the matter of illustrations.

In every respect this will be the most complete guide to automobile touring ever published. The routes are so arranged that the entire country is covered, giving ample information to enable the tourist to leave any section and reach any other section over what is regarded as the most favorable touring itinerary.

It will be retained as a book of reference throughout the year. This is particularly true of the sixth annual Touring Number, because of the fact that every portion of the country is included. This means that it will prove as valuable for winter touring, as for the routes heretofore regarded as accessible only in the summer.

RECIPROCITY IN NEW JERSEY.

The present liberal motoring law in New Jersey has been in force long enough to give the people of that state some idea of how it is going to work out, albeit, the actual touring season has not opened as yet. The chief objection of the opponents of reciprocity in that commonwealth lay in the supposition that the registration of automobiles would see a large reduction under the new plan. The report of the automobile department for the first five months of 1912 shows exactly the opposite to be true.

The total registration for this period was 39,799, as compared with 25,878 in 1911. It also has been found that many non-resident owners are taking out annual licenses, instead of depending upon the 10 days' touring privilege. Even had the state not felt it necessary to increase the registration fee, the treasury would have been in much better condition under the new arrangement.

In view of the length of time needed to convince the people of New Jersey that reciprocity was a desirable institution, the condition outlined above is particularly pleasing to motorists. Some time, all the states will recognize that universal motoring laws are equally as advantageous, and automobile touring in America will receive an impetus which will result in financial benefit to all concerned.

Digitized by Google

MASSACHUSETTS AND MOTORISTS.

The report of the Massachusetts highway commission for the first five months of 1912 shows that by the most conservative estimate the motorists in that state will contribute at least half a million dollars in registration fees toward the construction and maintenance of highways. In addition to this, may be mentioned the fines collected from motorists by the courts of the commonwealth, which amounted to $26,744.50 in 1911. Inasmuch as the summer season cannot be said to have opened yet and as many motorists from outside the state secure licenses during their vacation in Massachusetts, it is possible that the above figures will be augmented somewhat.

In view of this situation, it hardly can be held that the automobile owners of that state have no interest in any legislation contemplated. The legislature of 1912 has been prorogued without taking definite action upon two of the important bills presented. Reference is had to the proposition to increase the registration fees and that of limiting the weight of motor trucks utilizing the highways. Undoubtedly, this means that these measures will figure prominently in the campaign next fall. Automobilists are prone to forget such matters at election time, but the organized motorists of Massachusetts should take pains to remember these bills when the legislative tickets are made up.

DANGEROUS HIGHWAY TRAFFIC.

Organized motorists have done much good work in the matter of correcting existing evils, but they have found so much to do that it is surprising what success has been achieved. Attention is now being directed toward the dangerous grade crossings, whether used for steam trains or electric cars. These are not only death traps for the motorist, but for the public at large, and when this situation is fully realized all classes of individuals will unite in demanding their extinction.

Grade crossings represent archaic methods. A greater percentage of them are unprotected, even with gates or signal. Even where gate protection is provided, this is removed at night, when most needed. The antequated signs imparting the admonition to "Stop, Look and Listen," are inadequate, and often these are hidden from view around a curve or behind trees and shrubbery.

Some few states have made feeble attempts to enact laws abolishing the grade crossing, but in most cases little effort has been made to enforce them. Until such time as they are entirely eliminated, flagmen should be on duty, at least from 6 in the morning until midnight, and in addition some loud sounding signal should be installed.

Progress must necessarily be slow until public opinion is sufficiently aroused, but the time is certainly coming when the users of the highway will be fully protected from dangers of this nature. It is not reasonable to suspect that the railroads will take the initiative, and it behooves motorists to take the required steps to bring about the desired change.

CONCERNING THE OPEN MUFFLER.

Within the past few months there has been a wide demand for the elimination of the use of the muffler cut-out, and in some instances motorists have been decidedly surprised to learn that legislation on the subject has been enacted. This applies particularly in Rhode Island, where several operators have had the matter brought very forcibly to their attention.

Recent tests, conducted by engineers fully capable of determining results, indicate that there is little need for the cut-out on the modern automobile. Its use certainly could be restricted to the open country without entailing any hardship upon the motorist. Since this is true, it would seem to be the better part of discretion to accede the point.

Motorists are bound to feel the need of public opinion in securing many of the reforms that are regarded as necessary to the proper enjoyment of automobiling. It will be through attention to the minor things that this will be acquired. A good place to begin is in the matter of the muffler cut-out, and it ought not to be necessary for the public to have recourse to the enactment of special legislation upon the subject.

GROWTH IN EXPORTS.

The remarkable growth in automobile exports from the United States during the past three years, in which the increase has been something like 300 per cent., is bound to be a source of much pride to the American public. Not only does it indicate that the condition of the industry is such that it can reach out for additional markets and care for them satisfactorily, but the comparative figures show that the United States now occupies a position second alone to France in the matter of exportations in this field.

MOTORING NEWS OF NATIONAL IMPORT

National Association of Automobile Manufacturers Plans Pretentious Show Circuit for 1913---Engineers' Meeting in Detroit---Census Figures for Michigan---Increased Activity Marks Industry's Growth.

The National Association of Automobile Manufacturers at a recent meeting in New York City arranged a 12-city circuit for shows during the coming year, the determination for such a plan being announced immediately after a session of the executive committee, and show managers in 12 of the largest cities of the country will assist in promulgating the new idea. Chester I. Campbell, manager of the Boston show, was chairman of the committee appointed to arrange the national dates, as follows:

Cleveland, Jan. 4-11; New York, Jan. 11-18; Philadelphia, Jan. 20-25; Detroit, Jan. 27-Feb. 1; Chicago, Feb. 1-8; Minneapolis, Feb. 10-15; Kansas City, Feb. 17-22; St. Louis, Feb. 24-March 1; Pittsburg, March 3-8; Boston, March 8-15; Buffalo, March 17-22; Indianapolis, March 24-29.

The plan was not adopted until after a lengthy discussion, those present at the meeting finally deciding unanimously that it would result advantageously to both manufacturer and show promoter.

The subject of special trains for the conveyance of exhibits and employees, co-operative advertising and uniform rules also was considered, and a committee was appointed to confer with the Motor and Accessory Manufacturers in an endeavor to procure its co-operation and sanction of the circuit.

It is possible that the summer of 1913 will see a commercial vehicle exhibition and demonstration conducted by the N. A. A. M., which may or may not take the place of the winter shows as now held, this being a subject for which the opinion of the trade will be canvassed. The matter has been referred to the show and commercial vehicle committees.

Other business transacted included the admission to membership of the Auburn Automobile Company, Auburn, Ind., represented by J. I. Farley and the Ideal Motor Car Company, Indianapolis, Ind., represented by E. G. Sourbier. H. R. Bradford was elected to succeed R. A. Palmer as representative of the Cartercar Company, Pontiac, Mich., and H. W. Taylor to succeed B. A. Becker of the Elmore Manufacturing Company, Clyde, O. The membership formerly held by W. J. Groves, representing the Mack Bros. Motor Car Company, was transferred to C. P. Coleman, representing the International Motor Company, New York City, of which the Mack concern is now a constituent.

Show managers present were: Louis Block, Philadelphia Automobile Trade Association; T. I. Cochran, Pittsburg Automobile Show Association; A. E. Doherty, Automobile Show Association of Pittsburg; F. W. Paynes, St. Louis Automobile Dealers' Association; H. E. Pence, Minneapolis Automobile Show Association; W. F. V. Neumann, Detroit Automobile Dealers' Association; F. H. Calet, F. C. Wood, Cleveland Automobile Show Company; Chester I. Campbell, Boston Automobile Dealers' Association; H. L. Archey, Indianapolis Automobile Trade Association; A. L. Pope and S. A. Miles of the N. A. A. M. show committee.

SIMMS PLANT REOPENED.

Edwards Motor Car Company Men to Produce Magnetos, Cars and Trucks.

Capital connected with the Assets Realization Company of New York and Chicago has secured the $1,000,000-plant of the Simms Magneto Company, Bloomfield, N. J., and it is understood that a working agreement has been made with C. G. Stoddard and H. J. Edwards, of the newly organized Edwards Motor Car Company, to open the factory and resume the production of Simms magnetos. This plan will not affect the motor car concern, plans of which include the announcement of the new Edwards-Knight within the near future.

Arrangements also are said to have been completed for the purchase of the Longest Bros. truck plant in Louisville, Ky., which is to be operated by the Edwards Motor Car Company. The plans in connection with this deal are understood to include the production of the Longest truck as a Knight engined model for 1913. The Edwards car is to be produced in this factory.

MARMON COMPANY EXPANDS.

Additional Factory Facilities Being Provided to Take Care of Increased Demand.

In order that it may be able to increase its output to meet the demand created for Marmon cars, the Nordyke & Marmon Company, Indianapolis, Ind., has made arrangements for substantial additions to its plant. A new office building is to be erected, this being a two-story brick structure, 43 by 155 feet. The general and executive offices will be located on the first floor, and the enlarged drafting rooms on the second. Two stories, 52 by 243 feet, also will be added to one of the factory buildings.

WOLVERINE TOURISTS.

Detroit Motorists Elaborately Entertained by Remy Electric Company at Its Factory.

A noteworthy motor car tour was that taken recently by the Wolverine Automobile Club of Detroit, to Indianapolis, Ind., and return, a distance of 703 miles. Fifty-one cars, each carrying the colors of the club, represented the following makers: Hudson Motor Car Company, Detroit; Maxwell-Briscoe Motor Company, Tarrytown, N. Y.; Lion Motor Car Company, Adrian, Mich.; Olds Motor Works, Lansing, Mich.; Alden Sampson Manufacturing Company, Detroit; Chalmers Motor Company, Detroit; Oakland Motor Car Company, Pontiac, Mich.; Buick Motor Company, Flint, Mich.; Hupp Motor Car Company, Detroit; Warren Motor Car Company, Detroit; Nordyke & Marmon Company, Indianapolis, Ind.; Peerless Motor Company, Cleveland, O.; Winton Motor Carriage Company, Cleveland; Abbott Motor Company, Detroit; K-R-I-T Motor Car Company, Detroit; Packard Motor Car Company, Detroit; Studebaker Corporation, Detroit, and Pratt-Carter-Sigsbee Company, Indianapolis.

One of the most pleasing features of the trip was the entertainment of the entire party of tourists at Anderson, Ind., by the officials of the Remy Electric Company. Just outside the city, the travellers were met by General Manager H. W. Griffith of the Remy company and the Remy band, which acted as an escort to the borders of the city, where the cavalcade was joined by a body of mounted policemen, a delegation from the city government, headed by Mayor Foster, representatives of the press of Anderson and eastern cities, and Secretary W. S. Gilbreath of the Indianapolis Hoosier Motor Club.

Wolverine Tourists Being Entertained by the Remy Electric Company at Factory in Anderson, Ind.

The tourists were escorted to a tent, raised on the lawns of the Remy company, where a luncheon was served. Among those gathered about the tables were Henry Ford of the Ford Motor Company, Detroit, his son, Edsal; Frank Kulick, his racing driver, and some of his factory lieutenants; Harry Matthews, president of the Jackson Automobile Company, Jackson, Mich.; C. D. Cutting, engineer of the Clarke-Carter Company, Jackson, and Chief Engineer Berger of the Oakland Motor Car Company.

After the luncheon and post-prandial exercises participated in by several automobile men known throughout the country, there was an inspection of the Remy plant under the guidance of General Manager H. W. Griffith, E. F. Willett, Detroit branch manager; W. F. Hamilton of the executive staff; H. E. Krause, factory manager; W. O. Kennington, assistant chief engineer; I. J. Reuter, chief engineer and F. E. Moskovics, sales manager.

ENGINEERS IN DETROIT.

Interesting Programme of Papers, Discussions and Entertainment for June Meeting.

The mid-summer meeting of the Society of Automobile Engineers will be held in Detroit, June 27 to 29. The following programme has been arranged:

Papers—"The Effect of the Relation of Stroke and Bore in Automobile Engines," John Wilkinson; "Motor Sizes and Drive Ratios for Commercial Vehicles," E. P. Batzell; "Cost of Work with Gasoline Motor Trucks," Louis Ruprecht; "Stability of Automobile Propeller Shafts," J. M. Thomas; "The Standardization Work of the S. A. E.," Henry Souther, chairman of the standards committee; "An Exhaustive Motor Test," Herbert Chase (introduction by F. R. Sutton); "Tests of Aluminum Alloys," H. W. Gillett; "Worm Gears," Frank Burgess; "Helical Gears," Frank Burgess; "Standardization of Drawings," George W. Dunham; "Test of Knight Motor," R. C. Carpenter; "Leaf Springs," Leavitt Lane.

Reports of standards committee divisions—Broaches, C. W. Spicer, chairman; carburetors, G. G. Behn; data sheet, C. P. Poole; frame sections, J. G. Perrin; iron and steel, Henry Souther; miscellaneous, A. L. Riker; sheet metals (aluminum), T. V. Buckwalter; springs, Harold L. Pope; truck standards, W. P. Kennedy.

Digitized by Google

The Detroit committee of arrangements includes: H. E. Coffin, Hudson Motor Car Company; H. W. Alden, Timken-Detroit Axle Company; Russell Huff, Packard Motor Car Company; E. T. Birdsall and Mason P. Rumney, Detroit Steel Products Company; Tracy Lyon, General Motors Company; F. H. Floyd and E. E. Sweet, Cadillac Motor Car Company; H. R. Corse, Lumen Bearing Company; C. W. Dunham, Chalmers Motor Company; F. H. Berger, Oakland Motor Car Company; J. G. Vincent, Hudson Motor Car Company.

NEW TIRE PLANT.

United States Rubber Company's Capital Increased to Provide Additional Facilities.

Following the announcement by the United States Rubber Company, New York City, of an increase in capital stock from $75,000,000 to $120,000,000, comes information from the United States Tire Company, that plans are under way for the erection of another plant, which is expected to have the largest output of any factory of its kind in the world. The two projects—that of increased capitalization and that of another factory—go hand in hand, the latter, in a way, being dependent upon the former.

The United States Tire Company is now operating four immense tire plants, these being located at Hartford, Conn., Detroit, Mich., Providence, R. I., and Indianapolis, Ind. The daily output runs into the thousands, yet such has been the demand that additional production facilities are deemed necessary.

J. M. Gilbert, general manager of the United States Tire Company, says the proposed new factory will increase the company's output about 5000 tires daily. At present, by working eight-hour shifts in all the plants and utilizing all available equipment, the company is barely able to care for its trade. The new factory, besides being the largest of its kind in the world, will be equipped with the most modern machinery known to the industry. Information concerning its location is to be made public soon.

NOTED BRITISH MOTORIST.

Lord Montagu Visits America to Become Better Acquainted with Conditions on This Side.

Lord Montagu of Beaulieu, Eng., probably one of the best known motorists in that country, is on a tour of the United States, where he is paying particular attention to road and motoring conditions. Besides being editor of "The Car," he holds a seat in the House of Lords, where he represents the motorists' interests, is vice president of the Royal Automobile Club of Great Britain, handles all engineering and motoring news for the London Times, and is a special correspondent for the Daily Mail. He will remain in this country until July, his itinerary including visits to Washington, St. Louis, Indianapolis, Chicago, Cleveland, Detroit, Buffalo, Syracuse, and other cities where automobile factories will be inspected, and in Montreal and Quebec.

Considerable time was spent in New York in a study of the state roads, while one of the features there was a ride over the Long Island motor speedway as the guest of W. K. Vanderbilt, Jr. Lord Montagu expressed himself as highly pleased with the new roads and especially with the construction of the motor parkway, which he believes takes care of the dust problem. He says that the motorists of the United States have every reason to feel gratified with the automobiling and highway conditions, and he predicts a great advance within the next year or two. He adds it will be only a question of time before the highway authorities will effectively solve the road building situation by making them of suitable depth so as to provide permanency, and by making the surfaces durable for a longer period and practically dustless.

BAY STATE REGISTRATION.

Decided Increase in Number of Cars Licensed During First Five Months of Year.

Figures recently compiled by the Massachusetts highway commission show that before the year is ended fully 50,000 cars will be registered, from which the state will receive a revenue in excess of $600,000. Already the registrations are within a few hundred of the total last year, and the money derived from fees is less than $4000 under the grand total for 1911. Summer registrations have not started so that it is estimated that last year's total will be surpassed before the end of the month.

E. J. O'Hara, who has charge of the automobile department, has registered 38,169 cars, so far this year, which is an increase of over 27 per cent. over last year, when the number was 29,955. For the whole of 1911 the total registration was 38,907. The commission has taken in so far this year $473,579.50, against receipts of $374,534.75 for the corresponding period last year and $477,417.95 for the entire year of 1911.

As all the money, with the exception of about $63,000 that is used for the expenses of the automobile department of the highway commission, goes to the maintenance of state highways, and the improvement of other through routes, it is plain that this year the motorists will pay a sum in excess of $500,000 for actual use on the roads of the state. In addition to the fees there are fines, amounting last year to $26,744.50, which also go into the road maintenance fund.

At this time and in this connection a review of the registration figures for the past eight years and for the first five months of 1912 might be of interest:

1912 (to June 7)	38,169	473,579.50

SEEK LION FACTORY.

Adrian Capitalists Would Retain Motor Car Concern Which Lost Heavily by Recent Fire.

Soon after the disastrous fire, which destroyed the factory of the Lion Motor Car Company, maker of Lion cars, in Adrian, Mich., June 2, the officials of the company received a tempting offer from the Chamber of Commerce in Detroit. It would appear, however, that there is some doubt about the acceptance of the proposition, since several business men in Adrian have decided to raise $100,000 in additional capital in an effort to induce the concern to remain in that city.

ANOTHER NEW CAR.

Dodge Bros. of Detroit Reported as Experimenting with Machines on Michigan Roads.

It is understood that Dodge Bros., Detroit, formerly engaged in the manufacture of motors and gears utilized in Ford cars, is about ready to announce the production of pleasure and commercial vehicles, experimental machines having been tested out on the roads of that city and vicinity for a number of weeks. Frederick J. Haynes, until recently factory manager of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., is said to have been engaged in a similar capacity with the new enterprize. Detailed plans will be awaited with interest.

MICHIGAN CENSUS RETURNS.

Figures Set Forth Remarkable Growth in the Very Heart of the Automobile Industry.

The rapid growth of the automobile industry in the State of Michigan from 1904 to 1909 is shown in a recent report of E. Dana Durand, director of the 13th census. The increase in value was much greater relatively than that in number. Compared with 33 establishments in 1904 there were 113 in 1909, while the average value a machine in 1909 was $1086 as against $718 in 1904.

The entire value of automobiles produced in 1904 was $6,552,804, and in 1909, $70,359,749. The value of all other products reported, which, for the most part, represents the value of automobile bodies and parts turned out by establishments engaged primarily in that branch of manufacture, increased even more rapidly than that of the complete machines. This item was $1,443,730 in 1904 as compared with $26,291,702 in 1909.

The increase in number of cars produced during the five-year period, their value and other points of interest concerning the growth of the industry, is set forth in the following table:

	1904		1909	
	No.	Value	No.	Value
Buggies, runabouts and touring cars	9023	$6,481,164	62,319	$64,940,793
Limousines and cabs	*	.....	1,560	3,825,066
Service vehicles	*	.....	146	273,108
Delivery Wagons	51	35,250	401	319,071
Trucks and all others	51	36,390	374	1,001,711
Other products, including bodies, parts and repair work	...	1,443,730	....	26,291,702
Totals	9125	$7,996,534	64,800	$96,651,451
Gasoline cars	9114	6,537,404	64,262	69,130,223
Electric cars	11	15,400	538	1,229,526

*Not reported.

The growth of the industry is shown in another manner as follows:

State of Michigan.

	1904	1909
Number of establishments	33	113
Persons engaged	2,953	28,098
Proprietors	17	29
Salaried employees	201	2,625
Wage earners	2,735	25,444
Primary horsepower	1,800	25,938
Capital invested	$4,347,000	$52,926,000
Salaries paid	236,000	2,570,000
Wages paid	1,268,000	15,491,000
Cost of materials	3,443,000	53,882,000
Value of products	7,997,000	96,651,000
Value added by manufacture	4,554,000	42,769,000

City of Detroit.

	1904	1909
Number of establishments	19	68
Persons engaged	2,191	17,437

GOODYEAR ADDS TO CAPITAL.

Akron Tire Concern Follows the Lead of Other Manufacturers in Its Field.

Within the past month several well known tire concerns have increased their capital stock and otherwise provided for additional production. Among the latest to make an announcement of this nature is the Goodyear Tire & Rubber Company, Akron, O., which has increased its capital from $6,000,000 to $15,000,000. Part of the money will be utilized in making improvements and extensions of the factory facilities.

Digitized by Google

THE G. C. KEROSENE VAPORIZER.

The fuel problem is being given more serious attention abroad than in this country and many engineers and individuals are devoting considerable time and money in efforts to produce a suitable and efficient vaporizing device for operating internal combustion engines with kerosene, and other heavy fuels. The advantages resulting from the use of these is, perhaps, more appreciated in countries where the price of gasoline is almost prohibitive, and this applies especially

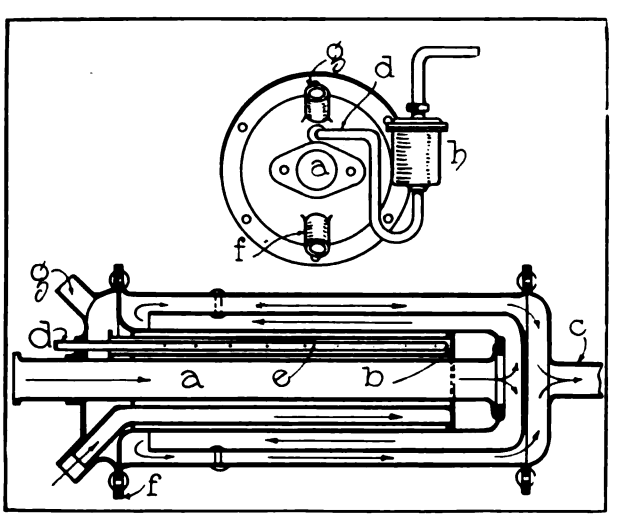

Fig. 1—G. C. Vaporizer, a Simple Device for the Utilization of Kerosene and Heavy Fuels with Internal Combustion Motors.

to the tropics. Kerosene may be considered a household necessity, and naturally is more readily obtainable, to say nothing of its lesser cost.

The British and Colonial G. C. Syndicate of London, England, has adopted a vaporizer known as the G. C., and it is stated that the device is being operated with success on a number of motor cars, including both pleasure and commercial vehicles. It is the invention of Mr. Constantinesco, a Roumanian engineer, who has had extensive experience with the various oil fields in his native land and possesses an intimate knowledge of the nature of mineral oils.

The vaporizer is depicted at Fig. 1 and is simple in construction as will be noted by the sectional and end elevation drawings. This particular model is built in combination with the muffler and it is stated that it may be utilized in place of the latter. The hot exhaust gases are discharged through a central pipe a, gilled on the outside and having strips of brass secured to it longitudinally. These are not shown in the illustration, however. The object of this arrangement is to retain the heat, also to keep the vaporizing chamber b at an even temperature. After passing through the chamber b the gases travel back along the outside of the latter and find egress at the outlet c.

The fuel to be vaporized enters at d, and is conveyed through a long perforated pipe e inserted in the vaporizing chamber, the temperature of which is stated to be maintained at between 500 and 600 degrees, Fahrenheit, when the motor is running. A small opening f at the end of the vaporizing chamber is provided for the purpose of admitting a stated amount of atmosphere, which is heated and mixed with the vaporized fuel, forming an explosive mixture which is drawn into the cylinders of the motor through g.

An auxiliary air valve is also fitted on the intake pipe and employed to obtain the proper mixture. The flow of fuel to the vaporizer is automatically controlled by the speed of the motor through the medium of a simple device consisting of a vessel h, similar to an ordinary float chamber, fitted with a glass gauge for the purpose of noting the level of the fuel. Inside this member is a jet, consisting of a piece of .25-inch copper tube slotted down each side by a saw cut .0625 inch wide. An adjustable valve controls the supply from the tank to this regulator, the amount of fuel being sufficient to meet the demands of the motor when at its maximum speed. The valve is adjusted easily and may be set with the engine operating.

Digitized by Google

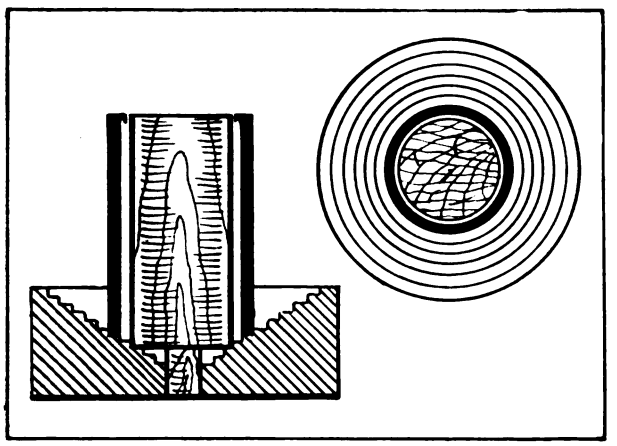

Fig. 2—A Universal Jig for Pouring White Metal.

As generally is the case with heavy fuel vaporizers, the device must be heated to a certain temperature before the motor will pick up on the kerosene. This is accomplished by operating with gasoline, then changing to the heavier fuel.

Experiments conducted with the G. C. vaporizer are said to have demonstrated the fact that the motor would operate equally well upon either fuel. A noticeable feature in connection with the utilization of the crude oil was the continuous discharge of residual tar from the drain pipe attached to the vaporizer. It is also claimed that the fuel consumption compares very favorably with that of the Diesel engine, and that greater mileage and a more flexible motor are obtained.

UNIVERSAL JIG FOR BUSHINGS.

A device for service when bushings are to be lined with white metal is outlined at Fig. 2 and the sketch is almost self-explanatory. The internally stepped base is made of cast iron, each step being .1875 inch or .25 inch smaller in diameter than its neighbor. Several wooden cores of various sizes are constructed to fit tightly into the centre hole. It is obvious that any bush resting upon a step suitable in size will be central with the wood core. The stepped core and bush should be well heated by a blow torch and the part to be lined well tinned before the metal is poured. The wood core should be quite smooth, and should taper very slightly toward the top and it also should be well smeared with black lead before pouring.

NEW VICTOR AIR COMPRESSOR.

The up-to-date garage no longer relies upon the hand pump, but is equipped with a compressed air system, an arrangement permitting of the storage of air for the inflation of tires, and cleaning the upholstery of the motor car, as well as the chassis. The Victor Electric Company, Chicago, has brought out a new compressor which is designed to be belt driven from a line shaft.

It is a double-cylinder unit, having a 2.5-inch bore and two-inch stroke. The pistons are fitted carefully and means have been provided for keeping these well lubricated. The valves are especially designed and are constructed to withstand the great strain to which they are subjected in operating at high speeds.

The compressor, which is shown at Fig. 3, can be operated safely up to 360 revolutions a minute at which rate it gives a capacity of four cubic feet or 30 gallons of free air a minute. A pressure of 125 pounds may be maintained easily and a higher ratio if desired. The pulley is located between the cylinders and it is claimed that the device operates with the least possible noise, that all parts are interchangeable, and that it is economical in operation.

HISEY ELECTRIC BREAST DRILL.

Portable electric hand or breast drills are a valuable addition to the shop equipment as by them work may be drilled either in the vise or on the car. At Fig. 4 is presented one of several types manufactured by the Hisey-Wolf Machine Company, Cincinnati, O. It is made in three types and the motor is operated by a direct current of 110 or 220 volts. It is equipped with two side handles, one detachable and one combination end, and a breast handle. Their speed under load varies according to the design, being from 400 to 900 revolutions a minute. The chuck is offset, allowing drilling in close corners.

The motor is completely enclosed, air-cooled, the openings being in the housing and protected by a brass screening, thereby preventing any cuttings from getting into the motor, no matter in which position the drill is operated. The gears are cut from solid steel, hardened, run in grease, and are separately encased. The brush holders and wire connections are also en-

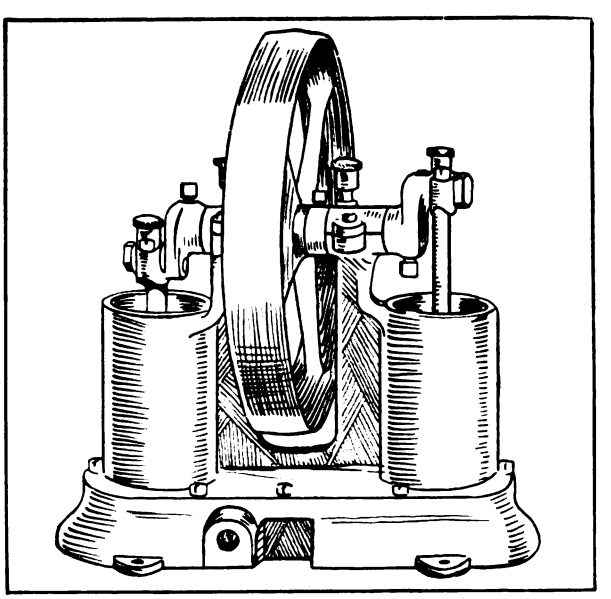

Fig. 3—New Double-Cylinder Compressor Brought Out by the Victor Electric Company.

Digitized by Google

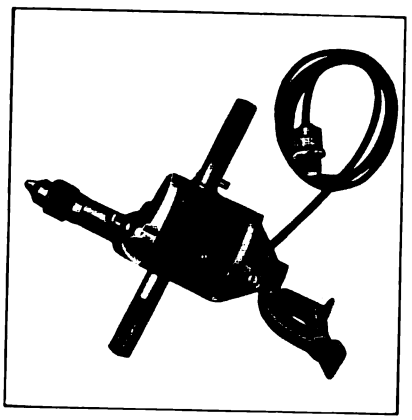

Fig. 4—Hisey Portable Electric Drill.

closed, preventing short circuiting. The drill and armature spindles are provided with ball thrust bearings.

The operation of the drill is controlled by a patented, enclosed automatic switch which controls current by means of a brass trigger operated through the permanent handle. It is claimed that this construction prevents the operator burning his fingers or short circuiting the motor, and that the drill is under control at all times. The handles are made of hollow steel tubing, screwed into the housing. Each attachment plug has a fusible cap, protecting the motor from an overload. The drop cord is connected on the outside of the motor housing with an insulated cover, preventing any possible damage by lead wires and inside connections should it be accidentally torn loose.

OXI-CARBI WELDING OUTFIT.

Oxy-acetylene welding outfits are important factors in the repair of automobiles, as the process permits the welding of broken and cracked parts which were formerly discarded. Although there are concerns which make a special business of welding, some repair shops are installing the apparatus, saving much time as well as deriving profit.

The Oxi-Carbi Company, New Haven, Conn., manufactures both portable and stationary welding outfits and these are designed for any number of blowpipes. The equipment outlined at Fig. 6 is known as the No. 2 and this with the No. 4 is more generally installed by the company.

The acetylene generators are of the carbide feed type and are said to be so designed as to make it impossible for those not familiar with their use to tamper with them and bring about accidents. In charging, the elevating screw shown on the bracket on the front of the hopper is raised to its highest point. This movement raises the feed lever and closes the valve that feeds the carbide. The upper section of the tank forms the expansion chamber and the lower the generating compartment.

Raising the two right hand cock levers shuts off the expansion chamber. Raising the right hand lever gives vent to the generating chamber, and the water filling cock can then be opened, as well as the sludge valve. Turning the agitator handle at the right of the tank loosens the sludge or lime that has settled in the tank. The top of the tank is provided with a removable plug for replenishing the supply of carbide.

When the tank is filled with water to the overflow in the filling funnel, the cock is closed first, then the vent cock and last the gas cocks. The interference rods prevent operating differently, and as the vent pipe connects with the safety pipe which is run to the open air no gas will enter the room with this generator. The object of the expansion chamber is to reduce the air space when recharging, as with this shut off the only air admitted to the generator is in the generating chamber as the sludge is emptied. This air is exhausted as it is recharged, leaving but a small amount, and it is claimed by the maker that this arrangement prevents dangerous mixtures.

With all cocks closed, the elevator screw may be lowered, which allows the valve to open and the carbide to feed through. As soon as pressure of gas is sufficient the lever will raise and close the valve. Utilization of the gas causes the valve to operate and no further attention is needed until the supply of carbide becomes exhausted.

The outfit illustrated has 25 pounds capacity. The oxygen generators are of the pressure type and are operated by filling a tray with potassium chlorate mixed with manganese dioxide, and placing in the retort. The cover is then bolted on and the gas burners beneath are lighted. The heat causes the chemicals to give off a gas in the form of oxygen, this passing through purifiers into a storage tank at pressures

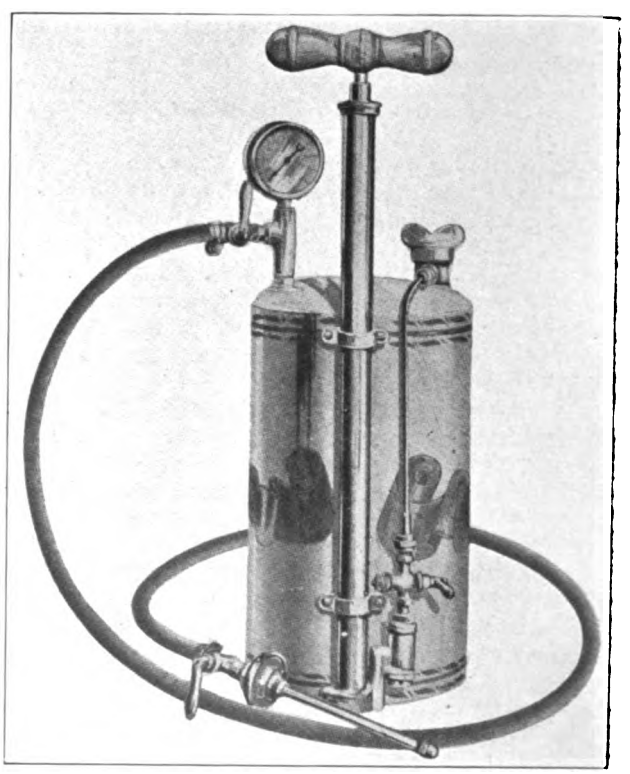

Fig. 5—Auto Engine Cleaner Which Utilizes Gasoline or Kerosene Mixed by Compression.

Digitized by Google

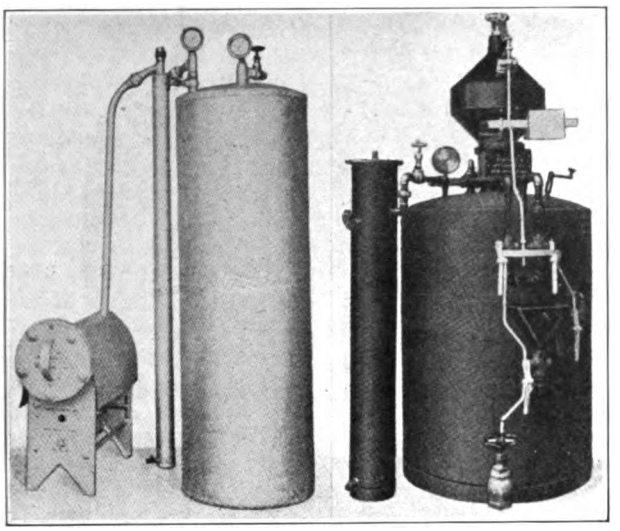

Fig. 6—Oxy-Acetylene Welding and Cutting Outfit Produced by the Oxy-Carbi Company.

suitable for welding and cutting. The tank requires from two to 20 pounds according to the size of tip employed, while for cutting, 30 to 75 pounds is utilized. It is stated that one tray full will produce approximately 28 cubic feet. The retorts may be recharged immediately if required.

The blowpipes utilized with the outfit are of the improved type and capable of performing a wide range of work, the No. 1 equipment having five tips, these being for sheet metal up to .25 inch thick and cast iron up to two inches. The welding tip may be removed easily and the cutting member substituted. The latter increases the pressure on the oxygen at the reducing valve and it is claimed that it will cut a two-inch round bar of steel in 90 seconds. In welding, all of the usual metals may be united, such as steel, aluminum and bronze of the different alloys; cast iron, malleable iron, wrought iron, etc.

AUTO ENGINE CLEANER.

In the overhaul of the motor car considerable time, as well as gasoline is utilized in removing the accumulations of grease and dirt that collect upon the various components. It is troublesome to remove all grease as many places are difficult of access with the ordinary brush.

The up-to-date repair shop employs air mixed with gasoline which is compressed to a high pressure, and when employed in this form removes dirt easily and quickly. The Cleveland Faucet Company, Cleveland, O., is marketing the Auto Engine Cleaner, shown at Fig. 5, which is designed for the repair shop, garage and private owner.

The complete outfit consists of a three-gallon, seamless, galvanized steel tank, to which a special hand pump is attached, also a gauge and a safety valve. Provision is made for the introduction of gasoline, kerosene or any other cleansing fluid. An air inlet cock is provided, also 10 feet of flexible tubing.

In practise, the tank is filled two-thirds full with gasoline and the outlet cock closed, after which the pressure is pumped up to 80 or 100 pounds. The air inlet cock is next closed, after which the other two members are opened and the apparatus is ready for service. The spraying nozzle is of sufficient length to reach easily any part of the motor or other components of the automobile.

OLMSTEAD POWER HACKSAW.

Any tool or device which will save time and labor in the repair shop is money well invested. In well appointed shops the hand hacksaw is employed only for fine work such as the cutting off of pins of small diameter, etc. Where heavy material is to be cut, considerable time is required with the hand tool and often some of the metal is wasted, to say nothing of numerous broken blades in the operation.

Power hacksaws are inexpensive and once the work is secured and energy applied, the device requires no further attention until the saw completes its work. During this time the workman can perform other tasks, and an advantage of the power device is that it cuts evenly and accurately.

L. H. Olmstead, Hasbrouck Heights, N. J., manufactures a variety of power hacksaws, these being adapted for light and heavy work. That depicted at Fig. 7 will take work up to 1.25 inches, either round or square, and it may be secured to the bench or table and driven from the main shaft of the power equipment. It is provided with a clutch for starting and stopping and is fitted with a swivel device to permit sawing at any angle. The driving pulley is six inches in diameter and should be driven at 175 revolutions a minute. The net weight of the machine is 16 pounds.

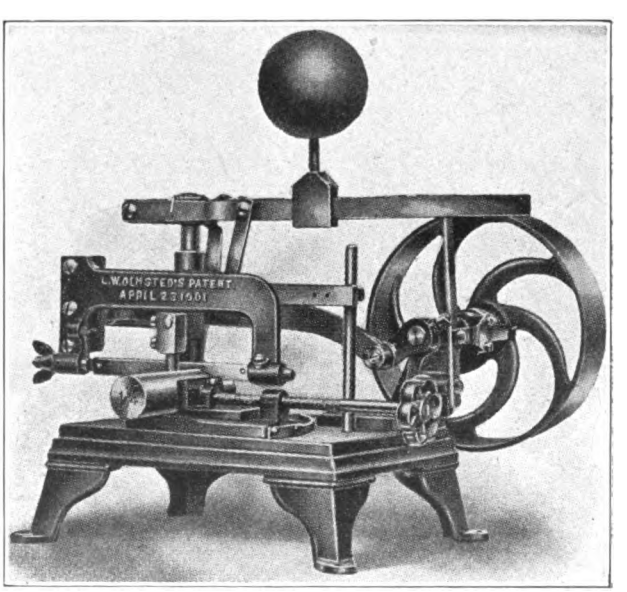

Fig. 7—Olmstead Power Hacksaw Designed for Work up to Two Inches, Either Round or Square.

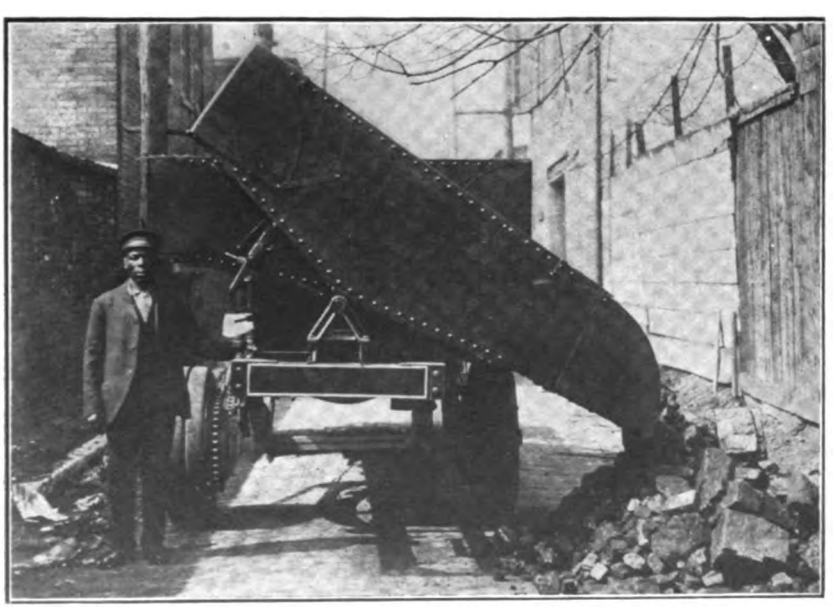
IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

LONGEST COMPARTMENT BODY.



The problem of dumping bodies is one which has proved of decided interest, both to the manufacturer and user of motor trucks. It is generally agreed that the utmost economy may be realized from a mechanical transport only when it is utilized to its maximum efficiency. Many coal concerns, for instance, are anxious to make use of the commercial vehicle, but hesitate to make the change from horse drawn equipment unless thoroughly convinced that the nature of their business is such as to warrant keeping the truck fully occupied.

In an effort to solve this problem for such business men, the Longest Bros. Company of Louisville, Ky., maker of the Longest truck, has brought out the patented individual compartment side dumping body, which is illustrated herewith. The particular advantage of this design, which is fitted to a four-ton chassis, lies in the fact that the truck may be loaded with as many as four different orders and delivery may be made with the same degree of economy as if the business were confined to the hauling of four-ton loads.

Each of the compartments is arranged to hold one ton, and each is provided with means for dumping individually, as may be noted from the cut at the bottom of this page. It may be added that the load may be dumped at either side of the vehicle.

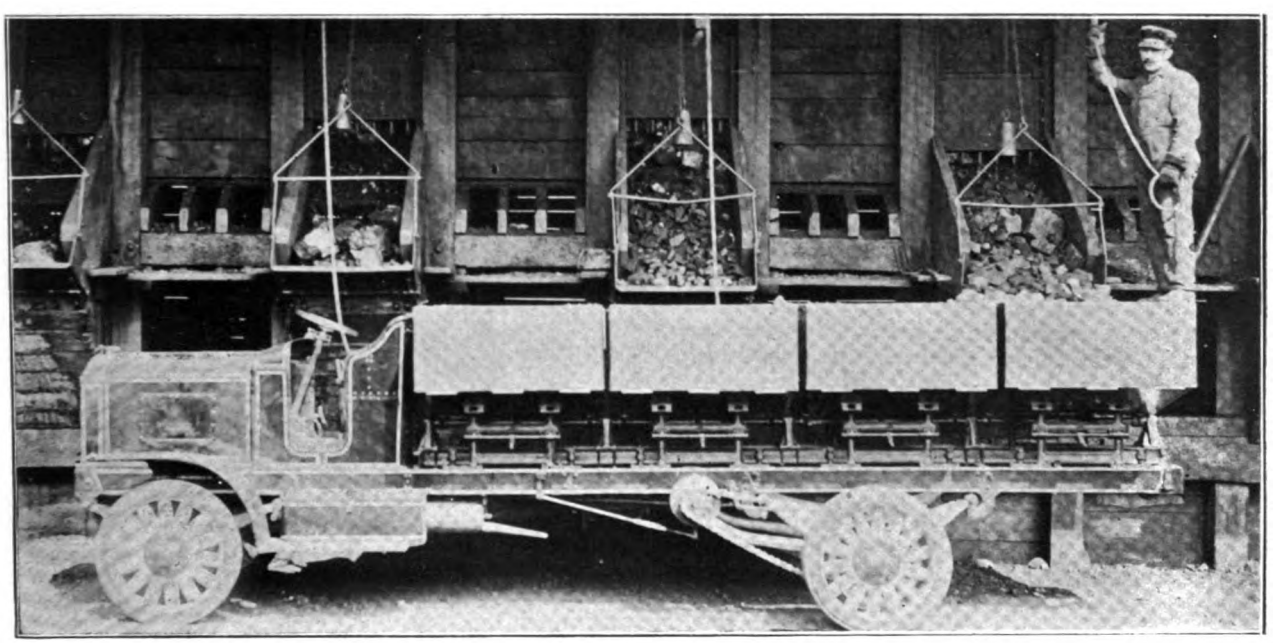
Let it be assumed, for instance, that the load is to be delivered in a narrow alley. No turning or backing is necessary; no manoeuvring to get into position. It is immaterial even which end of the alley is entered. The load is dumped just where it is wanted, and the driver is free to take the next order to its destination without delay. Suppose, however, that the alley is obstructed and that the driver cannot get through. As the material is dumped clear of the path over which the wheels must travel, the driver may back out much more quickly and easily than would be possible with a team.

The same thing applies to dumping on the sidewalk. In fact, no situation can be cited in which the load cannot be dumped as desired, unless, possibly, that in which the hole is located directly underneath the wagon, in which event, the Longest dumping body could be utilized as advantageously as any other type, except that especially designed for dumping through the bottom. This feature is of particular merit in itself.

Rear Compartment of Longest Body Dumping its Load, Indicating Simplicity of Operation.

From examination of the accompanying illustration, it will be seen that each compartment is hinged upon a central rod which is securely braced to the frame. At either side is a pivotally mounted support, a rod extending from the central hinged portion to the centre of this support. This latter rod has a threaded end which passes through the support and carries a nut.

The method of operation is as follows: The nut is screwed



Digitized by Google

back until it released a clamp which holds the side support in position. This support is hinged, one end folding up against the bottom of the compartment, while the other normally rests in sockets on the frame. As the clamp is released the hinged portion is folded easily, and the upper end is held in place by a catch on the bottom of the container.

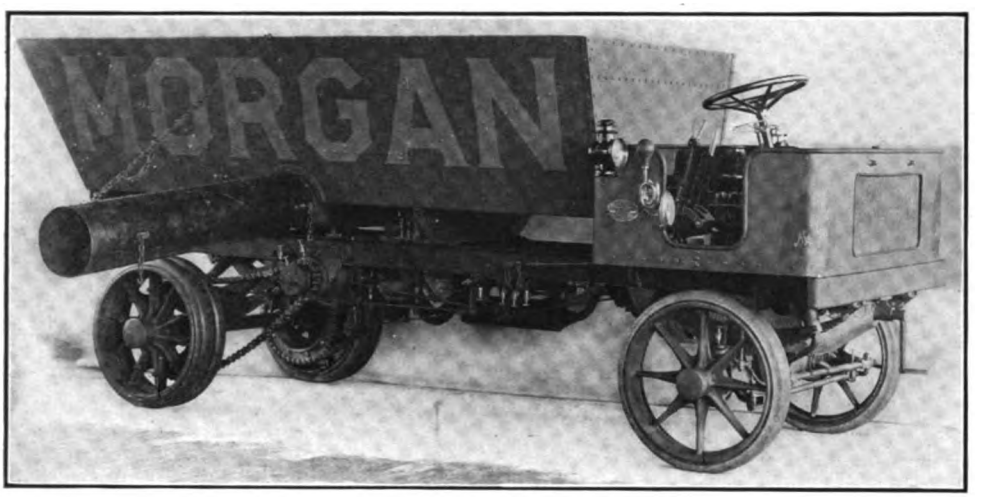
After this has been done, all that is necessary is to drop the chute door on this side of the dumper, which, as will be noted, is of metal, securely riveted. When it is in a normal position the floor of the compartment slopes from either side toward the centre, but as a catch is released on the opposite side, the support having been removed, the weight of the load tends to tip the compartment and the entire contents are emptied automatically.

The explanation takes decidedly more time in the telling than is required for actually accomplishing the work. As soon as the load is dumped, the body swings back into place, and it is only necessary to restore the supports to their original position, screw up the locking nut, and the truck is ready for the next delivery.

It is maintained by the maker that the use of this dumping body does not necessarily imply that a skilled workman must be employed. There is nothing about the construction that is intricate or not easily understood. It is a plain, simple piece of mechanism, with all parts substantially built, and not liable to breakage, even with extremely rough handling.

Longest Four-Ton Truck, Fitted with Patented Unit Compartment Side-Dumping Body, Receiving Its Load of Various Kinds of Coal.

MORGAN DUMPING DEVICE.



Another dumping design which has occasioned some little interest is the screw discharge body produced by the Morgan Motor Truck Company, Worcester, Mass. The construction is of steel, the sides sloping toward the centre, where an Archimedian screw is located crosswise of the body. Power to operate this is supplied by the motor, through a change gear mechanism, in which an extra gear and shaft lead to a chain wheel mounted on the side of the chassis.

A much larger wheel is mounted on the end of the conveyor shaft opposite to which is attached a removable chute. This wheel is fastened by a key, which, when withdrawn, permits the chain and wheels to rotate idly while the truck is being driven. When the load is drawn into position, the operator slips the key into place and the motor rotates the screw, which discharges the contents of the body without the latter being tilted or moved about in any manner.

This body is fitted to the new five-ton Morgan chassis, which has several features of merit. Prominent among these is the matter of load distribution, care having been exercised to cause all of the space from the front of the radiator to the rear cross members to serve a useful purpose. The motor is located in front, in the cab with the driver, who is placed at the right.

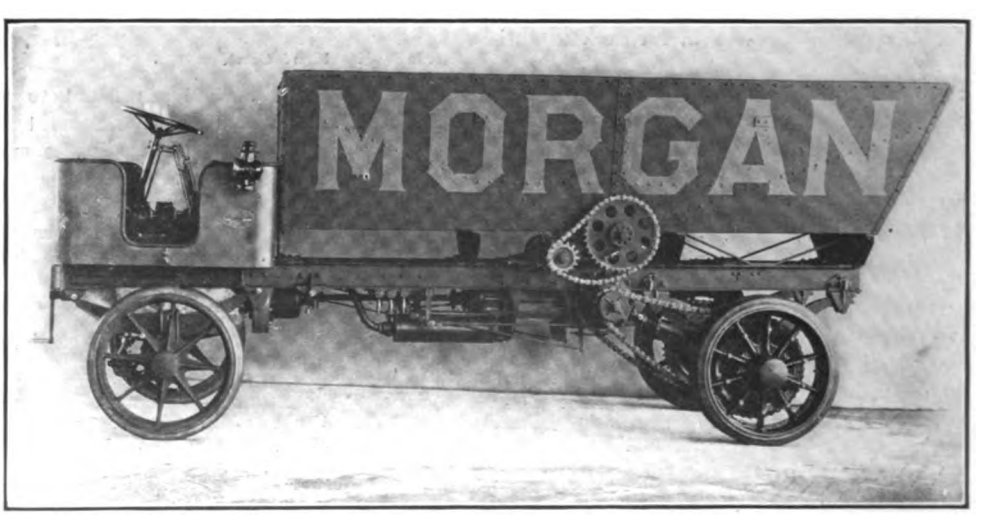
A vertical four-cylinder, four-cycle, water-cooled unit is employed, this having a bore and stroke of five inches and being rated at 40 horsepower. The cylinders are cast en bloc, with water jackets integral. Both the intake and exhaust valves are located in the removable cylinder heads, the latter being so designed that by loosening a few nuts they may be entirely withdrawn for inspection or grinding the valves. The intake and exhaust manifolds also are integral, and

Digitized by Google

Morgan Screw Discharge Body, Depicting Detachable Chute through Which Contents Are Emptied.

each end of the latter is provided with removable plugs through which any carbon may be released easily.

In the matter of cooling, the Morgan motor is noteworthy in design, as not only is provision made for maintaining the proper temperature under all conditions, but for cleaning as well. The exhaust side is fitted with a detachable plate, as is also the inlet side, and an opening in the latter allows water from the pump to be forced through a well designed manifold to the radiator. A large sized centrifugal pump, gear driven, takes the cooled water from the radiator, which is of high grade cellular type and of ample proportions.



Two separate and distinct ignition systems are employed, each having its own plugs. A four-unit vibrating coil, timer and battery furnish the ignition for the plugs on the left of the motor, while a high-tension magneto performs the same functions for those on the right. Either system may be operated independently. The lubrication system also is dual. A gear driven pump forces oil through an aperture in the crankshaft to each bearing and all connecting rod bearings, and this lubricant is circulated constantly. Interposed between the crankcase and the oil reservoir is a pressed steel pan carrying the lubricant for the splash system. The crankcase is constructed in three sections, and the lowest portion is equipped with two petcocks for noting the supply of lubricant and for draining off the old oil.

The Morgan clutch is of the multiple disc type with alternate plates of steel and copper, these operating in a bath of oil. A feature of the device is a leather universal attachment fitted between the flywheel of the motor and the clutch. This disc being of very flexible leather relieves the clutch of all shocks.

The transmission is of the selective type, providing three speeds forward and reverse, and the change speed gears are always in mesh. Clashing of gears is held to be impossible, as the transmission has a set of dogs on the face of each of the speed change gears, which are losely journaled on the driven shaft, and two corresponding double sliding clutches mounted on the squared portions of this shaft, by which any one of the change speed members may be locked to the shaft.

The jackshaft and transmission are a unit, and the former is mounted in a spherical housing, which in turn is supported by a substantial bracket secured to the main frame. This housing protects the jackshaft when the machine is traversing uneven roads, as it carries a spherical joint. Final drive is by double chain.

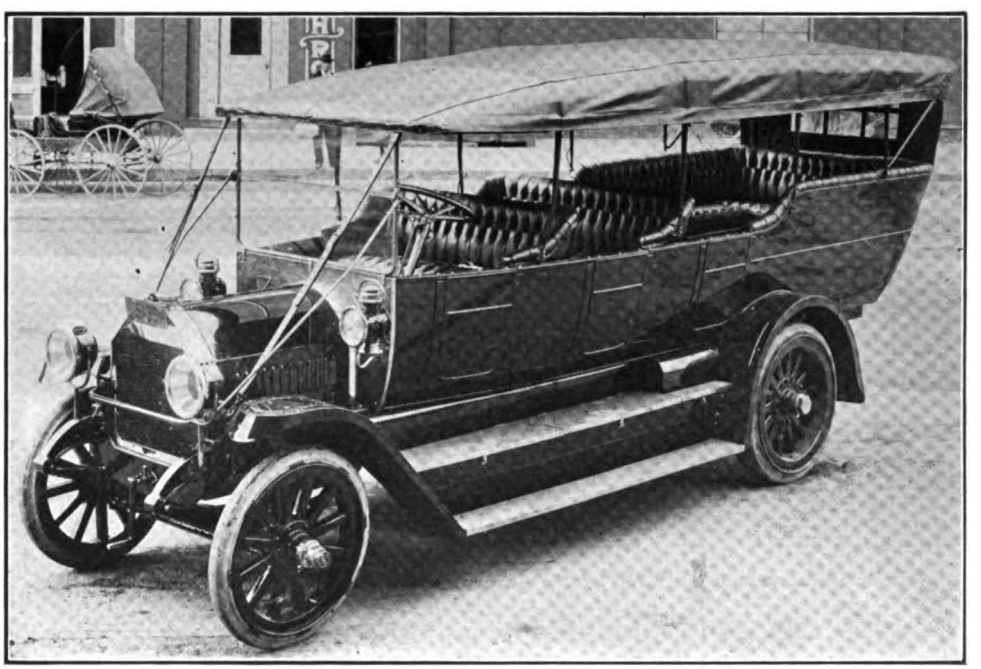
Springs are semi-elliptic, front and rear. Two sets of brakes are provided, the service members being external contracting on the jackshaft, and the emergency, internal expanding on the rear wheels. Solid metal wheels of the locomotive type are employed.

Morgan Screw Discharge Body, Showing Chain and Sprockets Actuating Archimedian Screw.

Digitized by Google

Tires are of solid rubber, 36 by six inches, single, in front, and 36 by five, dual, rear.

Another special feature is the use of patented universal couplings and joints, in which rubber blocks in sections are carried in a housing. The design is such that when energy is applied these members absorb all shocks, such as too sudden application of the clutch, improper changing of speeds and inequalities of road. These shock absorbers are fitted to the jackshaft, and one of the same design is utilized on the drive shaft.



G. M. C. SIGHT-SEEING CAR.

The General Motors Truck Company, Detroit, has brought out an interesting sight-seeing body, shown in the accompanying illustration. It is a full fore and side door model, and is claimed to be a distinct advance over designs which have been utilized in the past. As will be noted, the construction follows pleasure vehicle practise, and has the appearance of an elongated touring car.

The chassis is a standard two-ton G. M. C. with a wheelbase of 142 inches. The seats are well arranged, the two front members being placed so that the occupants face forward while the back seat is semi-circular in form. Accommodations are provided for 16 persons

The first of these vehicles was shipped to the Rainier national park, near Seattle, Wash., and is to be utilized in conducting parties through the park to the line of eternal snow on Mount Tacoma, over what is considered one of the prettiest scenic automobile drives in America. Incidentally, this will prove a severe test for the car.

It is anticipated that the design will meet with the approval of tourists everywhere, and that a general demand will be created for this machine wherever it is desired to cater to public touring parties. The refined appearance of the car is such as to warrant the supposition.

New G. M. C. Sight-Seeing 'Bus, Built Along Pleasure Car Lines and Holding 16 Passengers.

NEWS OF THE TRUCK FIELD.

The Packard Motor Car Company, Detroit, is announcing a five-ton model, which resembles the three-ton design manufactured by this concern, with the exception that it has a 40 horsepower motor, with bore of five inches and stroke of 5.5, and is of stronger construction throughout. The wheelbase is 14 feet and options of 12 to 16 feet in body space back of the driver's seat are offered.

The main offices of the General Motors Truck Company, which have been located in Detroit, will be at the factory in Pontiac, Mich., in the future. The lighter duty gasoline and the electric G. M. C. vehicles are made at this plant, the factory organization of which will remain as before. The branch office in Detroit will be removed into the new service station and garage at 12th and Fort streets.

The Universal Motor Truck Company has broken ground at 26th street and South Park avenue, Detroit, for the erection of a new service building, 112 by 150 feet, which is to be one of the most completely equipped in America. Similar stations will be located in New York City and Boston.

The Bucklen Auto-Truck Company of Elkhart, Ind., has purchased the factory of the Elkhart Wrench Company, in which it will produce Bucklen vehicles in the near future.

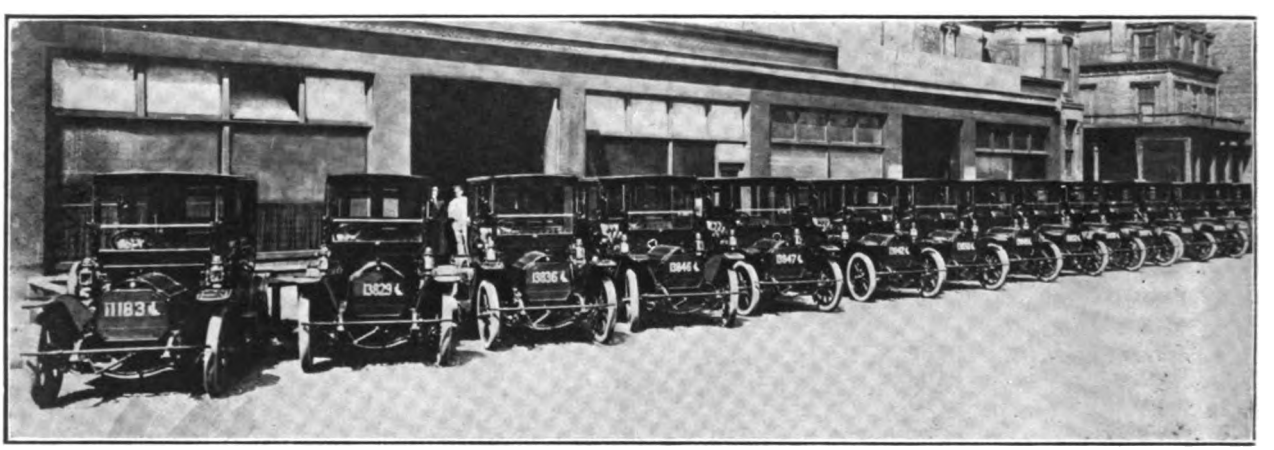
The International Motor Company, maker of the Saurer, Mack and Hewitt trucks, is building extensive additions to the Saurer plant at Plainfield, N. J. It is expected that the capacity of the plant will be doubled.

The Argo Electric Vehicle Company, Saginaw, Mich., is constructing a four-story addition to its factory, which, when completed, will triple the output of the company. The new structure is 150 by 150 feet,

Digitized by Google

and is to be ready for occupancy about July 15.

REORGANIZATION OF GRAMM COMPANY.



The final reorganization of the directorate of the Gramm Motor Truck Company was completed at a meeting of the board at Lima, O., May 23. G. W. Bennett, vice president of the Willys-Overland Company, was elected vice president to fill the vacancy caused by the resignation of B. A. Gramm. The full list of officers follows: President and general manager, John N. Willys; vice president, G. W. Bennett; secretary, James E. Kepperly; treasurer, Walter Stewart; assistant general and factory manager, Harvey L. Hooke.

The output of the factory is said to be almost double what it was before Mr. Willys purchased control. The factory force has been systematized, and plans for 1913 are constructive and extensive. Carl A. Neracher, the Willys-Overland Company's consulting engineer, is to have general oversight over the construction of the product. The sales will be made through the commercial car department of the Willys-Overland Company with headquarters in Toledo.

GROWTH IN AUTOMOBILE EXPORTS.

That 20,000 automobiles will be the export record of the United States for the fiscal year which ends with the present month, is the assertion of the bureau of statistics, basing its judgment on official figures for the past 10 months. Their value, including parts and accessories, will approximate $27,000,000. The figures on which this claim is made show that nearly 17,000 automobiles were exported to foreign countries in the 10 months ending with April, valued at $16,500,000; parts thereof, $3,250,000; tires, sent separately from machines under the head of exports of rubber manufactures, over $2,000,000, and automobile engines, $670,000, making a total for the 10 months of practically $22,000,000. These figures do not include the 900 machines sent to the non-contiguous territory, valued at about $1,500,000.

Although France formerly led the world in the exportation of automobiles, the United States now surpasses that and all other countries in rapidity of growth of production and exportation. As an example of this growth it is noted that the American exports increased from $5,000,000 in the calendar year 1908, to nearly $20,000,000 in 1911; while in the same period those of France increased from $24,600,000 to $31,700,000; United Kingdom, from $7,600,000 to $15,000,000; Germany, from $3,000,000 to $11,000,000, and Italy, from $5,500,000 to $6,100,000. Thus in the brief three-year period there was an absolute gain of 300 per cent. in exports from the United States; over 100 per cent. in the United Kingdom; 266 per cent. in Germany, and slightly more than 10 per cent in Italy.

Fleet of Garford Taxicabs, Made by the Garford Company, Elyria, O., in Service with the Frank Parmalee Company, Chicago.

GARFORD TAXICABS SUCCESSFUL.

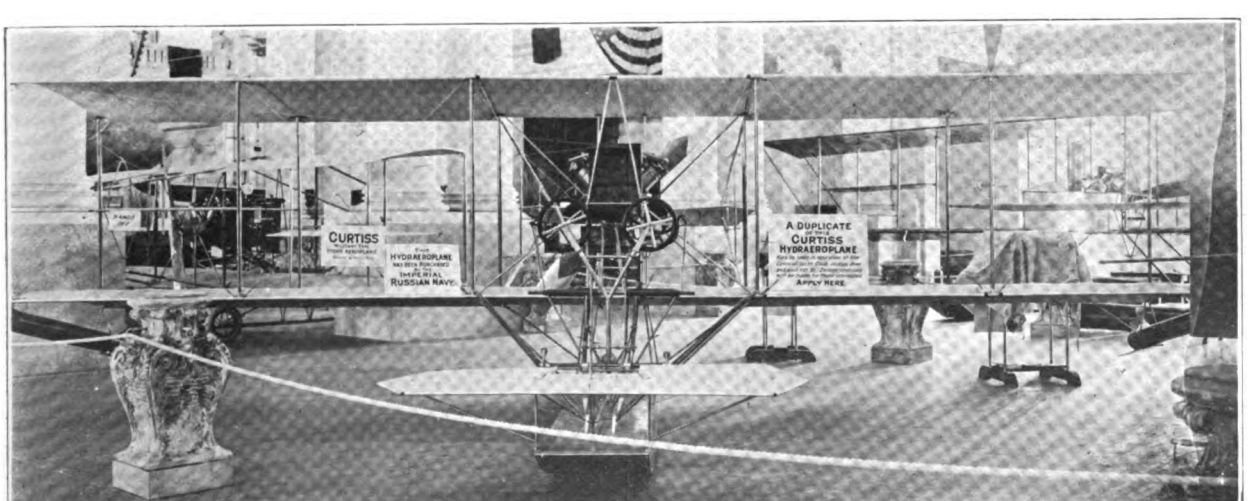
An accompanying illustration presents a part of the fleet of Garford taxicabs, made by the Garford Company, Elyria, O., in service with the Frank Parmalee Company of Chicago. These cars have given excellent satisfaction as is evidenced by the fact that the company has placed orders for 60 vehicles of the same type during the past year.

The Parmalee concern was induced to give the Garfords a trial under decidedly unusual circumstances. It was noted that competitors in the city were purchasing second hand Garford touring cars, on which they were fitting taxicab bodies. These reconstructed vehicles were watched carefully, and as they seemed to be working well, it was decided to employ specially constructed taxicabs of the same make.

A lover of horses all his life, President Joseph Gibbons of the Road Drivers' Association of New York, the largest organization of its kind in the country, has taken up motoring and in the future will divide his time between his stable of fast horses and a five-passenger Maxwell, built by the Maxwell-Briscoe Motor Company of Tarrytown, N. Y.

Digitized by Google

For the first time in the history of American aviation, at least, a surgeon answered a call for his services by the aerial route, June 10, when Dr. P. L. Alden of Hammondsport, N. Y., finished his trip to the home of E. A. Petrie of Urbana in a Curtiss hydraeroplane, driven by Hugh Robinson. The young son of Mr. Petrie fell down a stone stairway and fractured his skull, and Dr. Alden was summoned by telephone. On the way, his automobile broke down, and the doctor hailed Robinson, who was testing one of the Curtiss machines, explained the necessity for quick work and was carried the remainder of the distance, about 10 miles, which was covered in exactly six minutes.



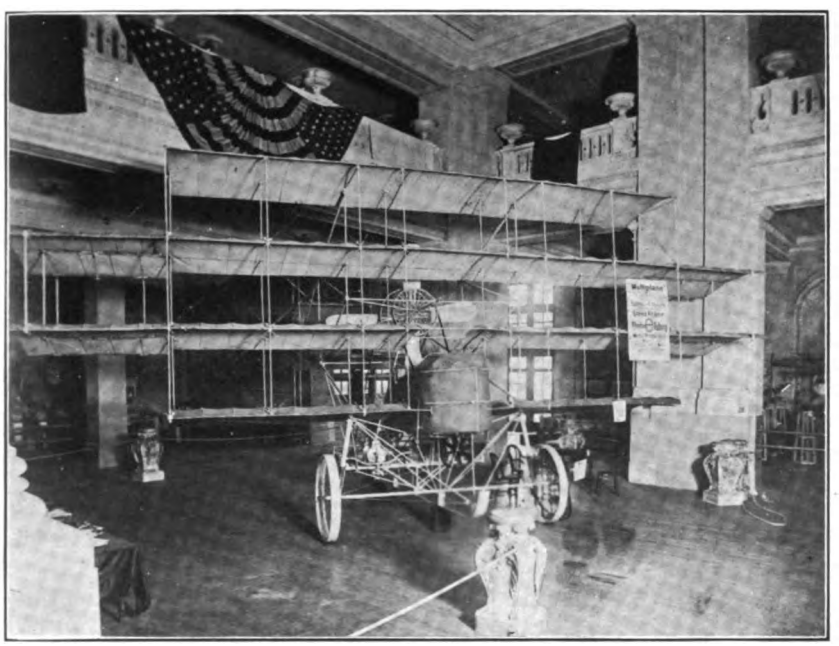
Although one of the world's foremost constructors of aeroplanes, and an inventor of aeroplane attachments of merit, W. Starling Burgess did not secure his pilot's license from the Aero Club of America until this month. Burgess had flown numerous machines, but did not consider it of sufficient importance to try for the license previously.

Plans are progressing most favorably for the great American circuit race, to be conducted by the Aero Club of Illinois and associated clubs during the international meet in Chicago in September. It is announced that arrangements have been made to accommodate 60 foreign and American aviators during this meet, and it is anticipated that most of these will take part in the circuit event. The tentative route is as follows:

Chicago to Cedar Rapids, Ia., 200 miles; Cedar Rapids to Des Moines, Ia., 120; Des Moines to Omaha, Neb., 100; Omaha to Lincoln, Neb., 60; Lincoln to Kansas City, Mo., 160; Kansas City to Jefferson City, Mo., 125; Jefferson City to St. Louis, Mo., 100; St. Louis to Charleston, Ill., 125; Charleston to Indianapolis, Ind., 100; Indianapolis to Cincinnati, O., 100; Cincinnati to Columbus, O., 90; Columbus to Akron and Cleveland, O., 130; Cleveland to Toledo, O., 100; Toledo to Detroit, Mich., 60; Detroit to Chicago, 220.

This gives a total of 1810 miles, which is nearly 700 miles longer than the European circuit of 1911. A grand prize of $25,000 and second and third prizes of substantial amounts, are expected to attract a number of foreign machines and men, who might not be induced to come to America were the race for the International cup the sole incentive.

An accompanying illustration presents the Curtiss hydraeroplane recently sold to the Russian government, this being a duplicate of a number which have been shipped abroad by the Curtiss Aeroplane Company, Hammondsport, N. Y. Louis Paulhan of France,



Curtiss Hydraeroplane, Sold to the Imperial Russian Government, on Display at the Recent Exhibition in New York City.

Digitized by Google

who has the Continental agency, has been decidedly active in introducing the American product. Among the experienced aviators he has secured to assist him is Eugene Bara, who has been flying Henri Farman biplanes for some time.

Both Paulhan and Bara will be entered in the competition of the Swiss Aero Club on Lake Geneva in August, when the contest for the hydraeroplane championship of Europe will be held. It is expected that this meet will take place Aug. 31, Sept. 1 and 2.

Although it is nearly two years since Edwin Gould announced a prize of $15,000 for the most perfect and practical heavier-than-air flying machine, designed and demonstrated in this country, and equipped with two or more complete power plants (separate motors and propellers) so connected that any power plant may be operated independently, or that they may be used together, it is announced that the contest to determine the winner will be held over one of the flying fields in the vicinity of New York City, July 4. Entries closed June 1, and the Scientific American, which has charge of the arrangements, has announced the list as follows:

Jacobs-Emerson Multiplane, a Novel Creation Constructed and Flown in Atchison, Kan.

Alleas Aeroplane Company, Boston, biplane; Howard Gill, Boston, biplane; H. Curtis, Manchester, Mass., Burgess biplane; Boland Aeroplane & Motor Company, Rahway, N. J., biplane; Edward J. Elsas, Kansas City, Mo., biplane; H. W. Mattoni, 217 West 120th street, New York City, multiplane; Macleod Multiplane Company, Richmond, Staten Island, N. Y., multiplane; Charles H. Burleigh, South Brunswick, Me., multiplane; George W. Beatty, Mineola, N. Y., biplane; Grover Cleveland Loening, on behalf of the Queen Aeroplane Company, Fort George, New York City, monoplane; John P. Conkling, 125 East 23rd street, New York City, biplane.

The third annual Boston aviation meet will be held at Atlantic flying field, Squantum, Mass., June 29-July 7, under the management of W. A. P. Willard. Already some 15 aviators, including Lincoln Beachey, Hugh Robinson, Frank Coffyn, William Hoff, Charles F. Walsh, Charles Witmer, Beckwith Havens and George W. Beatty have entered for the meet.

Among the machines displayed at the recent show in New York City, none attracted more attention than the Jacobs-Emerson multiplane, made by Multiplane, Ltd., Atchison, Kan. This craft is constructed under patents issued to H. W. Jacobs and R. Emerson, both of whom are well known engineers in railroad transportation. It is said to have been flown with splendid success near Atchison.

The machine is of the headless type, having four main planes in front and four tail planes in the rear, with an elevator immediately behind. The propellers, of which there are two mounted on the same axis, are placed midway between the main planes and are driven by leather covered, flat steel belts from two eight-cylinder, 80 horsepower, air-cooled motors of the V type.

Owing to its large surface the assembly is designed for weight carrying, and for that reason is provided with a large cabin having a double row of seats, capable of holding five persons comfortably. Particular emphasis is laid upon the fact that the craft is to be regarded as non-capsizing and self-righting in action. To demonstrate this feature, a quarter-size model was loaded to its proportionate capacity and carried aloft by a balloon. It was dropped edgewise from an altitude of approximately one-third of a mile and glided gently to earth with practically no shock or damage.

The landing chassis consists of one long centre skid, having two large 48-inch wheels in front and a single swivelling wheel in the rear. Contrary to the usual practise these wheels are not fitted with pneumatic tires, but instead have a broad, flat strip steel rim. Landing shocks are taken care of by spring and pneumatic plungers.

The control consists of a wheel mounted on a vertical column, which operates to the ailerons by a rotating motion. Fore and aft movement actuates the elevator. The vertical rudder is moved by twisting the whole column, wheel and all, around its axis.

The construction throughout is of a special type of steel tubing, known as Theta, this being in sec-

Digitized by Google

tional form, held together by a very strong and rapidly assembled steel joint. The spread is 37 feet, the length 29 feet eight inches and height 17 feet.

The problem of flying without power is far from being solved. The official contest for the $2000 prize offered in France was to have been held in Paris, June 2. Several entrants were on hand at the appointed time, but none of them was able to leave the ground. In order to capture the prize it was necessary to make a flight of at least 33 feet.

After flying in a Burgess hydraeroplane Rear Admiral Bradley A. Fiske of the United States Navy is convinced that the eight battleships of the North Atlantic squadron should be equipped with 12 aeroplanes each. He declares that the machines would be of great service in time of war, not only as scouts but as a means of destroying the unprotected shipping of the enemy and thus crippling its foreign trade.

Flying a Curtiss hydraeroplane, Glen L. Martin secured a new world's altitude record for this type of craft over Balboa Island, near Los Angeles, Cal., early in the month. He reached a height of 4400, exceeding the previous mark held by Hugh A. Robinson in a machine of the same make by 800 feet.

Eleven aviators competed in the aeroplane race bebetween Berlin and Vienna, June 9, in which Helmut Hirth, a former automobile racing driver, was the victor. He covered the 330 miles in 6:35:00.

The new Burgess-Curtis army biplane, constructed from specifications furnished by the United States Army, was given its first official trials at Marblehead, Mass., June 8. The machine is equipped with a 70 horsepower Renault engine and with this made a speed of 50 miles an hour. In the tests, the biplane was fitted with hydraeroplane attachment.

The new Thomas biplane, made by Thomas Bros., of Kanoma, N. Y., was given its initial tests near that town early in the month. The machine was fitted with a Kirkham four-cylinder motor of 40 horsepower, and made three flights at an altitude of 500 feet. Charles Niles was at the wheel.

Seven aviators competed in the flying Derby conducted by Claude Grahame-White over an 81-mile circuit around London, England, June 8. T. O. M. Sopwith finished first, his time being 1:22:00. G. Hamel was second, and W. Morrhouse third.

The Aero Club of America is planning a hydraeroplane race from New York to Boston, which is expected to be held some time during the early part of July. The contestants will leave New York City, flying over Long Island sound and around Cape Cod. The full details have not been made public, but it is understood that a total of $10,000 will be offered in prizes.

In the French circuit, covering 683 miles, which started and ended in Angiers, June 17, only one of the seven contestants finished. This was Rolland Garros, who flew the distance in 7:56:00, thereby winning a prize of $10,000.

At the meeting of the Wright Company in New York City, June 18, Orville Wright was elected president to take the place of his late brother, Wilbur Wright. The other officers of the company are: Vice president, Andrew Freeman; secretary and treasurer, Alpheus F. Barnes; directors, the officers and August Belmont, Cornelius Vanderbilt, Russell A. Alger, Theodore P. Shonts, Morton F. Plant, Edward J. Berwind, Pliny W. Williamson and Henry S. Hooker.

In response to a letter from Congressman William G. Sharp, W. Starling Burgess has compiled an estimated cost of equipment and maintenance of a Burgess hydraeroplane, such as might be available for use in aerial mail carrying. These figures are taken from the Aero Club of America's Bulletin, as follows:

First cost of complete hydraeroplane	$5500	
Housing with suitable launching device	1000	
		$6,500
Flying 15,000 miles at two cents a mile	$ 300	
Aviator at $100 a month	1200	
Mechanic at $50 a month	600	
Mechanic's board and incidentals	250	
Engine depreciation, yearly	750	
Aeroplane construction depreciation	800	
Repairs and other expenses	500	
		4,400
Total		$10,900

The new scout dirigible Conte of the French army created a new altitude record for this type of air craft near Paris, June 18, reaching a height of 9025 feet. The previous mark was held by the French army dirigible Clement-Bayard III at 9514, this having been made May 20.

The bureau of manufactures, Department of Commerce and Labor, Washington, D. C., announces that a foreign government will make some extensive purchases of aeroplanes and hydraeroplanes within the near future. The plans contemplate securing at least 30 machines, as a beginning and it is stated that American makes probably would be preferred on the basis of merit. Particular attention should be paid to the matter of carrying power. An appropriation of $515,000 has been made, and eventually the government in question will buy at least 100 machines.

By way of perpetuating the memory of the late Wilbur Wright, who made some of his first flights over French soil near that city, the municipal council of Mans, France, has voted to name one of its streets after the famous aviator.

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

NEW AMERICAN AERIAL MOTORS.

The importance of the power plant in determining the safety of the aeroplane is only just beginning to be appreciated by the American public. Students of aviation abroad have been paying rather more attention to this problem, however, as is evidenced by the fact that the revolving Gnome, the Renault, the Anzani, and perhaps some few other engines, are almost as well known in America as the machines to which these are fitted.

There has been a feeling that the design of the aeroplane, whether it be a monoplane, biplane or other type, was of prime importance in the matter of

Six-Cylinder Gray Eagle Aeroplane Engine.

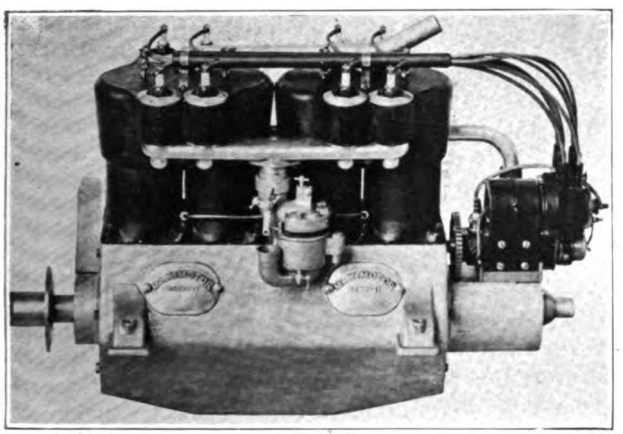
safety. It is by no means certain that this is not true, but one result of recent accidents has been to raise the question as to what extent the reliability of the power plant may be held responsible. Failure of the engine at an inopportune moment may have the effect of counteracting other safeguards incorporated in the construction of the machine itself.

It follows that considerable more attention will be paid to this feature in the future, and for this reason it will prove of interest to consider some of the motors which have made their appearance in the American market recently. No attempt is made herein to illustrate or describe all of the new engines which have been offered for aviation purposes, it being believed that the subject is of sufficient importance to merit a more thorough consideration than would be possible under such an arrangement.

SIX-CYLINDER GRAY EAGLE.

R. O. Rubel, Jr., & Co., of Louisville, Ky., is producing the six-cylinder, four-cycle, 50 horsepower Gray Eagle motor, which has been designed as a moderate priced aviation power plant. The engine has been tested out under all conditions, the company having invited amateur and professional aviators to visit its flying school, there to make such use of the motors as they may desire, free of charge, the object being to bring the product to the attention of the public and to give it practical working tests.

One of two very prominent features are claimed for this engine. Perhaps the most important is the matter of cooling. It is described as an air-cooled unit, although it is pointed out that the lubricating system is so devised as to aid materially in this work. The oil is pumped from the reservoir into the crankcase at the rate of three gallons a minute, and the construction of the concentric valve system is such that both valves form a sliding sleeve, the intake working within the exhaust, which is located directly in the cylinder head. These valves are slightly larger in area than those of water-cooled motors of the same cylinder displacement. This whole construction is with the idea of obtaining efficient cooling.



Each cylinder of the Gray Eagle motor is machined from an ingot of semi-steel which weighs 55 pounds in the rough, and when finished it weighs less than 10.5 pounds. The crankshaft is cut from a solid bar of vanadium steel and is mounted on seven large high speed nickel alloy bearings.

A normal speed of 1100 revolutions a minute is claimed by the maker, at which rate a standing thrust of 350 pounds is obtained with a seven-foot diameter propeller of five-foot pitch. The bore and stroke of the cylinders are four by 4.5 inches, and the weight complete, equipped with Bosch magneto, Rayfield carburetor, oiler, plugs and wires, is 260 pounds.

Digitized by Google

FOUR-CYLINDER MAXIMOTOR.

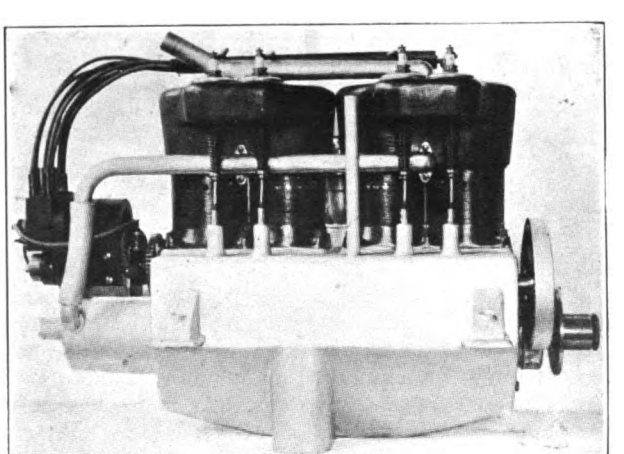
The Maximotor Makers, Detroit, has announced a four-cylinder, four-cycle, water-cooled Maximotor,

Inlet Side of 40-50 Horsepower Maximotor.

with bore of 4.5 inches and stroke of five and rated at 50 horsepower. A six-cylinder motor of the same design, rated at 75 horsepower, also is offered. The weight of the former, with radiator, is 238 pounds, and of the latter 340.

The motor has seen extensive use in this country and abroad, having been employed on Wright, Curtiss, Nieuport, Bleriot, Henri Farman and other aeroplanes, and on dirigibles in Japan. Particular attention has been paid to the matter of securing none but the best materials, and every effort has been made to produce an aviation motor which shall be recognized by the airmen of the world. The details of the four and six-cylinder units are the same in the main, and only the former will be described herein.

The cylinders are of the T head type, cast in pairs, with water jackets, valves, valve chambers and guides integral. The material is a semi-steel of very high tensile strength, thoroughly tested chemically and tried out under hydraulic pressure before machining, and again before installation in the engine. A pyramidical form, leaving no line for breakage, is given to the cylinder flange through which bolts are passed to the crankcase. Six .375-inch chrome nickel steel studs hold the cylinders down, with the assistance of hardened nuts and lock washers, and a paper gasket renders them oil tight.



The pistons are of the strong, convex section type, made of a special semi-steel of very fine grain, and are accurately machined inside and out, so that there is no possibility of unequal expansion and loss of power. The wristpin is hollow, and of hardened and ground steel. It is held in place by a large cotter pin. The three eccentric rings on each piston are ground, double-turned and pinned to insure good compression. At the bottom of the piston is a groove, which catches the oil sprayed upon it by the force feed jet and carried up and down to lubricate the cylinder walls.

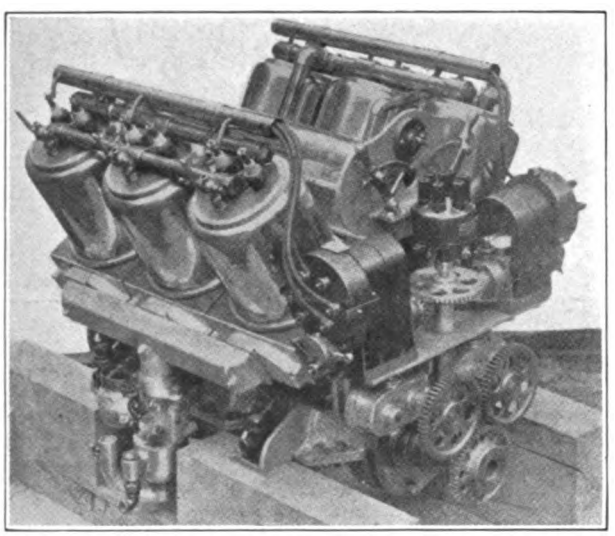
The crankcase is cast in one piece, with valve lift guides integral, of an easily welded aluminum composition. The centre bearing housing divides the case into two parts. Ribbed reinforcements are added at all points subject to strain. The supporting brackets are of a new type, on the bridge principle, and are so rigid that but four are required. Ample hand holes are provided.

The end plates or crankcase discs act as housings for the crankshaft end ball bearings. The front disc also serves as a housing for the crankshaft timing gear. The rear disc has three additional functions (five in all)—as housing for the magneto driving gear, support for the magneto, and also for the water pump. Each disc is held in place by five bolts, .375 inch, of nickel steel, locked with washer and nut.

The camshaft is made light of special steel tubing. The hardened and ground cams are fastened by taper pins, which are held in place by cotter pins. It is claimed that this arrangement allows of timing by hand with decided accuracy. Maximotor cams are of a rounded section that is very easy on the valve lifts and valves. The camshaft gear is of bronze. The valve tappets are of the mushroom type and are hardened and ground. The ordinary rollers are said to have been found unnecessary.

Lubrication is by the forced feed system. The crankcase with its tapering bottom acts as an ideal oil reservoir, and keeps the lubricant in the centre no matter how the engine may be tipped in flight. At the middle of the crankcase floor, in a little recess, lies the gear driven oil pump, continually working in oil and therefore requiring no priming to start. The pump is actuated by a steel rod reaching up to the camshaft. By loosening the screws on the small base plate to which the pump is attached, it and the rod and gear may be removed.

Exhaust Side of Four-Cylinder Maximotor.



All oil is pumped through pipe to an oil jacket around the gas intake manifold, where it is cooled. It then continues under pressure to points between each pair of cylinders, where in the form of a strong

Digitized by Google

jet it strikes the connecting rods, pistons and crankshaft. These parts, revolving at a speed of 20 revolutions a second, catch the oil and send it about in a fine spray that bathes all moving parts.

The oil jacket about the intake is held to be valuable in warming the intake and preventing the carburetor from "freezing" in high altitudes, as well as keeping the lubricant at a temperature which does not allow it to become thin enough to lose its lubricating qualities. The oil jacket is of glass and serves as a sight gauge, so that the aviator can tell at a glance the condition of both the oiling system and the carburetor.

The centrifugal water pump is made of aluminum and is fastened to the rear disc by five steel bolts. It is driven directly from the crankshaft by a special steel dog. The radiator is of a peculiar, patented, square tube type with water running around three sides of every square. In one of these radiators 20

Three-Quarter View of Six-Cylinder R. V. Motor.

inches high the water travels down through cooling passages 60 inches, or five feet.

TWO-CYCLE, SIX-CYLINDER R. V.

The Raymond Engineering Company, Boston, Mass., presents the six-cylinder, two-cycle, water-cooled R. V. motor of the V type, with bore and stroke of five inches, and rated at 75 horsepower. This is made in three models, the sole difference being the materials employed, which affect the weight. The engine is designed for automobile, motor boat and aeroplane service, and as model A is the lightest, weighing 375 pounds complete with dual equipment, it will be described.

While it is admitted that with an engine of the two-cycle type, every second stroke serves a useful purpose, as against every fourth stroke in the four-cycle, certain drawbacks to its use have been recognized by designers. The Raymond Engineering Company claims to have overcome three of the most important of these, i. e., insufficient pressure in the crankcase to force the mixture with required rapidity into the cylinder head; difficulty in preventing the fresh mixture and the burned gases from mixing in the cylinder head with consequent loss of some fresh mixture and retention of some of the burned gases, this condition bringing about a weak mixture, and the expulsion of the burned gases without back pressure.

In the R. V. motor the fresh gases enter from two opposite sides of the cylinder. The bypasses by which they enter are shaped to deflect them horizontally. They are deflected upward at the centre of the piston head; rise in the form of a column; meet an inverted cone in the cylinder head, which causes them to sweep the head of the cylinder; return downward along the cylinder wall, driving the exhaust gases before them; the piston being timed to rise and to close all ports just as the fresh charge reaches the top of the exhaust ports. It is argued that every action of the fresh mixture is directed as if the cylinder were filled with an infinite number of small tubes bent to carry these gases through the exact paths desired. The large exhaust ports allow quick escape of burned gases.

The cylinders are cast singly, the material being semi-steel. Each has two spark plugs, not with the idea of having one in reserve, but for firing simultaneously. These are located where they are thoroughly cleaned by the rushing, sweeping action of the fresh charge, and are not pocketed. When they fire, they do so in the midst of a column of fresh mixture.

The pistons are also of semi-steel, and while each must have its own connecting rod, the placing of the cylinders has been such that but one crankpin is employed for each pair of connecting rods. This not only reduces the length of the crankshaft by one-half, but permits of a smaller diameter on account of this. The shaft is of special nickel steel and is hollow, while the connecting rods are of the same material. The crankcase is of aluminum alloy.

As each crankcase feeds the mixture to two cylinders, the intake system from the carburetor is required to handle but three ports. Owing to the peculiar and distinctive action of the two pistons working closely together, but not exactly together, it is claimed that it is impossible to make the engine run backward accidentally. The cooling system has been designed with great care to give a maximum of cooling water where most needed and not to carry the weight of pockets of dead water where not required. The circulation is by two rotary or gear pumps.

In the accompanying illustration, it will be noted that the cylinders are so mounted that the two Schebler carburetors are located in the centre on either side of the assembly. The two Bosch magnetos are at the front end, and the actuating mechanism is clearly visible. The entire motor is light, strong, simple and compact. In addition to the features mentioned, it is pointed out that there are no valves, valve springs, tappets, cams, camshafts or camshaft gears. Every part is easily accessible.

NATIONAL CONTEST AND RACING NEWS.

Detailed Plans Concerning Vanderbilt and Grand Prize Events---Revised Results in Recent 500-Mile Contest---Old Orchard Beach Programme---Proposed Meets in Several Cities---Annual Electric Vehicle Run.

Formal application for sanctions for the Vanderbilt Cup and Grand Prize events has been made by the Milwaukee Automobile Dealers' Association, and there now appears to be no reason why the contest board of the American Automobile Association will not take definite action in the near future. With the application comes the announcement that the Vanderbilt Cup and Pabst Trophy races will be held Sept. 17, and the Grand Prize and Wisconsin Trophy events, Sept. 21. Of course these dates are tentative.

The proposed entry blanks have been forwarded to New York, and give the following details: Vanderbilt cup—Distance, 287.925 miles, or 33 laps of an 8.725-mile course; entrance fee, $500 for one car, $800 for two and $1000 for three; limited to cars of 301-600 cubic inches piston displacement. Pabst trophy—Distance, 218.125 miles, or 25 laps; limited to cars of 231-300 inches. Grand Prize — Distance, 401.350 miles, or 46 laps; entrance fees, $1000 for one, $1500 for two and $1700 for three; no limitations. Wisconsin trophy—Distance, 157.05 miles, or 18 laps; limited to cars of 161-230 inches.

The prizes are as follows: Vanderbilt, $3000, $2000, $1000 and $500; Pabst, $1000, $500, $250 and $125; Grand Prize, $3000, $2000, $1000 and $500; Wisconsin, $1000, $500, $250 and $125.

REVISED INDIANAPOLIS FIGURES.

The revised figures concerning the 500-mile race on the Indianapolis speedway, Memorial Day, do not affect the final standing of the contestants, although there is a slight variation in the time made by some of them. While Ralph De Palma and his Mercedes claim to have exceeded certain records during the race, Joseph Dawson and the winning National hold that no records are recognized unless the car making them finishes the contest. Inasmuch as Dawson also exceeded all previous marks for these distances it is expected by the National Motor Vehicle Company that its machine eventually will be awarded these records by the contest board of the American Automobile Association. As revised the time of the various contestants in 100-mile periods was as shown in the accompanying tabulation. It will be noted that in this revised list Mulford's Knox is credited with having finished the race, although in the original report it was announced that this contestant was flagged.

REVISED TIME OF CONTESTANTS IN 500-MILE RACE.

Car and Driver	Miles— 100	200	300	400	500
National, Dawson	1:14:24	2:30:59	3:48:50	5:04:14	6:21:06

FOUR-STATES TOUR.

The officers of the Indiana Automobile Manufacturers' Association have approved the route for the Four-States tour which will be held July 9-24, there being only a few slight modifications from the itinerary previously published. The route book was prepared by W. D. Edenburn of the Remy Electric Company, Anderson, Ind., chairman of the publicity committee, and embodies suggestions to tourists, rules of the contest, and a list of the names of the entrants. This tour will cover 1283.9 miles through Ohio, West Virginia, and Kentucky, as well as nearly 300 miles in the Hoosier State. The route was laid out by Clarence LeMar in a Great Western machine which will also act as the pilot car during the tour. The new Henderson car, the popular priced product of

Digitized by Google

the Henderson Motor Car Company of Indianapolis, Ind., was the first to present an application blank and will thus be entitled to the No. 1. The object of the tour is to advertise the cars built in the Hoosier State.

DETAILED RESULTS AT SALEM.

Although announcement was made in the last issue of The Automobile Journal concerning the winners in race meet at Rockingham park, Salem, N. H., June 8, time did not permit of presenting the details of the various contests. While the principal event of the day, so far as distance was concerned, was the 50-mile race won by Le Cain in a Stutz, much interest centred in the special match race won by Harry F. Grant in a Berkshire. The detailed summary follows:

Five Miles, 301-450 Inches.

Car Driver	Time
Buick, Jessup	5:37.4
Stutz, Le Cain	.....
Berkshire, Grant	.....

Five Miles, Amateurs, Match.

Thomas, Kingsley	5:51.0
Bianchi, Slater	.....
Buick, Bigelow	.....

Ten Miles, Free-for-All, Handicap.

Lexington, Esleek	13:22.4
Hudson, Willis	.....
Chadwick, Hersey	.....

Twenty Miles, Special, Match.

Berkshire, Grant	25:12.8
Jackson, Cobe	.....

Fifty Miles, 301-600 Inches.

Stutz, Le Cain	54:20.2
Berkshire, Grant	.....

TWO-DAY CHICAGO MATCH.

The first inter-club race between the Chicago Motor Club and the Illinois Athletic Club was held June 6-7, the former winning by a score of 34 to 70, in the matter of penalization. The route covered about 200 miles, extending from Chicago to La Salle, Ill., and return. One car was withdrawn on either side, the following machines finishing with perfect scores: Chicago Motor Club—Sinsabaugh, Velie; Stalnaker, Premier; Van Sicklen, Apperson; Hirschl, Pierce-Arrow; Lee, K-R-I-T; Zimmerman, Stutz; Simmons, Hupmobile; Breakstone, Midland; Gaidzik, White; Choate, KisselKar; Deagon, Pierce-Arrow. Illinois Athletic Club—Lewin, Chadwick; Iverson, Apperson; Cooney, Winton; Ganshue, Bergdoll; Knab, Pierce-Arrow; Stein, Winton; Wolf, Locomobile; Wilson, Cadillac; Canton, Overland; Bersbach, Mitchell.

ENTRIES FOR TACOMA.

Although the entry list of the races in Tacoma, Wash., July 5-6, under the auspices of the Tacoma Automobile Club and Tacoma Carnival Association, do not close until July 1, 10 cars have been entered to date. The first of these was the Mercer, driven to third place in the recent 500-mile race by Hugh Hughes. A second car of the same make will be represented, although the driver has not been named as yet. Among the other cars and drivers are Earl Devore in a National and Earl Cooper in a Stutz.

Four events are planned for the two days. July 5 there will be three races as follows: One hundred miles, for cars of 230 inches; 150 miles, for cars of 231-300, and 200 miles, for cars of 301-450 inches. The first two will be run simultaneously over a five-mile course. July 6, the 250-mile free-for-all event will be held for the Montamarathon trophy. Prizes totalling $10,000 are offered for the four contests.

OVERLAND WINS ABROAD.

In a recent contest in Austria, an Overland car, made by the Willys-Overland Company, Toledo, O., in competition with 60 other machines of American and foreign manufacture, made the best time between Vienna and Abbazia, a distance of 528 kilometers. Besides winning first prize the Overland was awarded 53 points for condition, style of body, mechanical perfection of motor, and comfort.

QUAKER CITY MEET.

Robert Burman, driving an Ohio car, took the Remy grand brassard at the opening meet of the season on the Belmont track, Philadelphia, June 8. Later, he reduced the mile track record, driving the "Blitzen" Benz the distance in 0:54.26. The summary of the meet follows:

Ten Miles, 161-230 Inches.

Car Driver	Time
Buick, Bauer	11:34.08
Flanders, Duval	.....
Empire, Smith,	.....

Six Miles, Special.

Mercer, Thebaud	6:28.58
Kline-Kar, Menker	.....

Five Miles, 301-450 Inches.

Kline-Kar, Menker	5:09.99
Stutz, Blockson	.....
G. J. G., Thebaud	.....

Ten Miles, 451-600 Inches.

Cutting, Burman	10:15.14
American, Earle	.....

Five Miles, Special.

Lion, David	7:24.37
Otto, Ervin	.....

Twenty-Five Miles, 231-450 Inches.

Cutting, Burman	25:53.42
American, Earle	.....
Ohio, Raimey	.....

Three Miles, Free-for-All, (Remy Grand Brassard.)

Ohio, Burman	3:15.91
Mercedes, Meneghetti	.....

Five Miles, Free-for-All, Handicap.

Mercer, Thebaud	5:10.56
Buick, Bauer	.....
Kline-Kar, Menker	.....

PROGRAMME FOR OLD ORCHARD.

The Old Orchard Automobile Association, Old Orchard, Me., has arranged an attractive programme for the three-day beach meet, to be held in connection with the old home week celebration, July 4-6. En-

Digitized by Google

tries do not close until June 29, and at the present writing the management has declined to make public any of the cars listed to appear. The programme follows:

July 4—Time trials, flying start, prize of $100; five miles, 161-230 inches, $75 and $25; 10 miles, 301-450 inches, $75 and $25; five miles, 301-450 inches, $75 and $25; 10 miles, 600 inches, $100 and $50; five miles, 301 inches, $75, $50 and $25; 100 miles, special event, three races at one time, 301-450, 451-600 and over 600 inches, $300, $150, $50 and $25.

July 5—Five miles, free-for-all, $100 and $50; 50 miles, 301 inches, $125, $75 and $25; five miles, 161-230 inches, $75 and $25; five miles, 301-450 inches, $75 and $25; 100 miles, over 301 inches, $200, $100 and $25.

July 6—Ten miles, 231-300 inches, $75 and $25; five miles, 451-600 inches, $75 and $50; 25 miles, special, two races at the same time, 161-230 and 231-300 inches, $100 and $25; 10 miles, free-for-all, $100, $50 and $25; 100 miles, special, three races at the same time, 301-450, 451-600 and over 600 inches, $300, $150, $50 and $25.

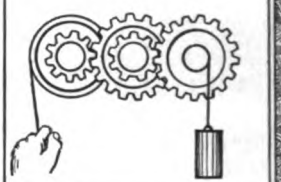
The course, which had its initial test last year, is one of the fastest in the country. In view of the fact that this year's meet is to be held in connection with a national holiday, it is anticipated that a large attendance will be present from all over New England and the East. The results in 1911 were such as to indicate that some of the best racing of the season will be seen. Several well known cars and drivers are expected to compete.

GALVESTON BEACH EVENTS.

Capt. J. W. Munn, chairman of the racing committee of the Galveston Automobile Club, Galveston, Tex., has been in the East during the past week in an attempt to secure entries for the annual beach meet in Galveston, Aug. 8-10. He also was a visitor in Indianapolis during the 500-mile race of Memorial Day, and promises to have one of the largest entry lists ever signed for the Texas beach. The Texas State Automobile Association is co-operating with the Galveston club in the enterprise.

ELECTRIC SUBURBAN RUN.

The annual electric vehicle contest of the Electric Auto Club in New York City was held June 15, 14 cars taking part. The route covered 45 miles, including Bronxville, New Rochelle and Pelham Manor. As outlined, there was to have been a secret time schedule, but for some reason this was eliminated. Among those who drove their own cars were Mrs. C. Y. Kenworthy, Miss Alice Pryor, Mrs. Alice E. Waxham, Mrs. Albert Weatherby, Mrs. Harvey Robinson, Mrs. E. E. Schwarzkopf and Mrs. W. R. Christopher. The makes represented were as follows: Anderson Electric Car Company, Detroit, three Detroit electrics; R-C-H Corporation, Detroit, two Hupp-Yeats; Rauch & Lang Carriage Company, Cleveland, O., two Rauch & Langs; Baker Electric Vehicle Company, Cleveland, O., six Bakers, and Flanders Manufacturing Company, Pontiac, Mich., one Flanders.



Line-Up in Central Park, New York City, at the Start of Annual Electric Vehicle Run.

WARREN WINS HILL CLIMB.

A Warren, built by the Warren Motor Car Company of Detroit, Mich., was the winner of the third annual Toll House Hill climb, near Fresno, Cal., recently, the event proving one of the most interesting of the kind ever held in central California. The Buick record of last year, 22:48, was lowered by three cars, the Warren leading, the time being 22:30. A Buick, built by the Buick Motor Car Company, Flint, Mich., was second in 22:32, and a second Buick was third in 22:36.5. The cars were compelled to cover a distance of 7.5 miles and negotiate a grade of over 40 per cent.

RECENT MOTOR VEHICLE PATENTS

Swern Self-Starter.

Among the recent patents granted for starting devices for attachment to internal combustion motors is that of Ernest V. Swern, Denver, Col., assignor of one-fourth to John H. East of the same city. The self-starter is manually operated by pedal located in a position convenient to the driver and depressing the pedal actuates a lever which in turn imparts energy to the starter proper which is attached to the front of the motor. The mechanism comprises a sleeve mounted upon the engine shaft and having an external spiral groove, and a clutch member loosely mounted on the sleeve. The clutch has a projection within the spiral groove whereby a rotary movement of the member is converted into a simultaneous movement of the same in one direction with relation to said sleeve, and a spring between the sleeve and a stationary surface opposes its movement in the opposite direction.

Douglas Lamp.

A patent for a motor car lamp has been granted to Harry A. Douglas, Chicago, assignor to the Adams & Westlake Company of the same city. It has an upper and lower section which are united by a set of frame bars, the marginal portions of which are bent to form seat panels and panel engaging shoulders. A set of panels engage these seats and have instanding flanges slidingly engaging the upper shoulders and the margins of the top and bottom sections. Clamping bars bind the panel sections to their seats.

Thompson Anti-Skid Device.

An anti-skid device which resembles in construction the usual tire chain, has been patented by Langdon S. Thompson, Jersey City, N. J. It comprises a series of multiple reversed loop bands arranged around the shoe, connected by intermediate links. The anti-skid members are alternately reversed and the loop members are graduated in size, increasing from the retaining chain to the centre of the tire.

Forney Muffler.

With the authorities of the various cities and towns enforcing the laws against the use of cut-outs, inventors are devoting their efforts to devise a muffler which will reduce back pressure to a minimum as well as be silent in its operation. Samuel W. Forney, Pulaski, Va., has been granted a patent for a muffler which comprises an outer casing having a flanged end and a pipe mounted therein. This tube is enclosed in a second casing and is provided with perforations. Branch pipes are also fitted, these having their inner ends secured in said perforations and their outer extremities connected to the openings of the casing. The burnt gases are broken up by a conoid deflector before entering the mixing chamber.

Schweinert Tire Valve Locking Cap.

Maximilian Charles Schweinert, West Hoboken, N. J., has patented a locking cap for tire valves and the like. A nut is utilized in combination with a swiveled part, these members having a recess formed between them in which is fitted a notched disc, which is adapted to engage one of the parts. A spring is connected with the other and employed to engage with the corrugated disc. The latter rotates with the nut and has an opening any diameter of which equals that of the bore of the nut.

Belew Pneumatic Tire Protector.

Charles A. Belew, San Diego, Cal., has been granted a patent for a pneumatic tire protector which not only is claimed to protect the shoe from contact with sharp stones, etc., but it completely envelops the casing. It conforms to the tread of the tire and completely encloses it. Extensions are provided on either side of the protector and these pass under the rim of the wheel and are secured by means of bolts and locking nuts. The inventor claims that not only is the shoe protected from injury but all dirt and moisture are excluded from the casing.

Bond Fender.

Jayson K. Bond, Milwaukee, Wis., assignor of one-half to Kenneth W. Jacobs of the same city, has been granted a patent for a fender applicable to the motor car. It is secured in a manner similar to those of usual construction and is equipped with a buffer carried by a pair of plunger rods. These extend through eyed brackets and the openings of guide blocks. Coiled springs are interposed between the brackets and the buffer and stops are fitted for limiting the forward movement of the plunger rods.

OTHER PATENTS GONE TO ISSUE.

Wheel Rim, James Ellis Hale, Akron, O., assignor to the Goodyear Tire & Rubber Company, Akron, O. Dual detachable rim having split expansion rings and means for securing same.

Water Cooling System, Russell Huff, Detroit, assignor to the Packard Motor Car Company, Detroit. Comprising water jackets, radiator and a multiplicity of conduits leading from upper and lower sections of cooler to pump and water manifold of cylinders.

Lamp Attachment, George S. Sherman, Great Neck, N. Y. A vehicle lamp bracket in combination with a support

Digitized by Google

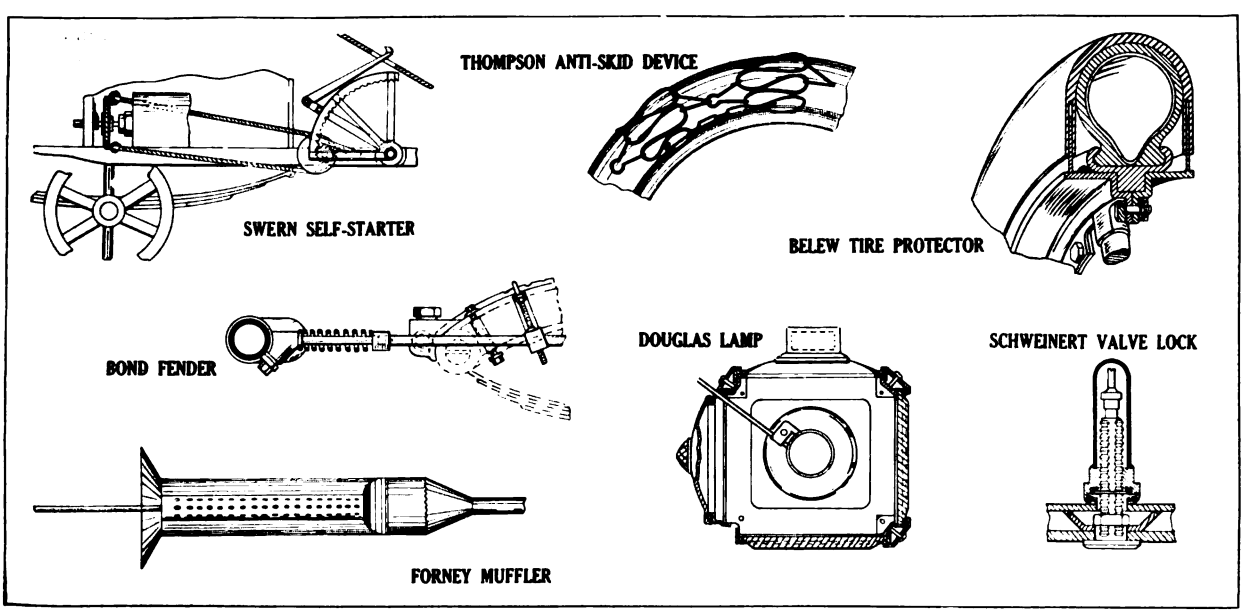
having a ball and socket bearing and means for swinging said bracket.

Automatic Headlight, George T. Tribe and John M. Bemis, Worcester, Mass. Lamp standard rotably mounted, including hinged plate, a lever plate and a screw plate, as well as means for raising and depressing the lamp to any desired angle.

Resilient Wheel, James R. Wright, Trenton, Mo. A wheel having a hub, a rim comprising a plurality of loosely coupled sections, links arranged at right angles to and offset from centre of hub and connecting the sections, also bowed springs for connecting the adjacent ends of the sections.

Acetylene Generator, Fay H. Young, Rockford Ill. The device has two casings, the inner member being removable and having a transverse partition above its lower end, forming a water reservoir in the upper compartment. The fluid flows between the casings to the carbide which is contained in a removable holder.

Shock Absorber, Charles O. Browne, Norwood, O. Two cylindrical casings telescoping and having a piston in a compression chamber and so designed that the movement of the piston in one direction will draw out the compression cylinder against the vacuum pressure.



is led to the lower chamber through a tube which is also perforated at a point below the partition. The lower chamber is provided with a petcock for draining off deposits of water and dirt.

Puncture Proof Tire, McRoy De Viese, Fresno, Cal. Two rims are provided, one slidingly mounted within the other and between the members is a pneumatic or resilient tire. A solid tire is utilized on the exterior rim.

Shock Absorber, Horace B. Stanton, Boston. The device comprises a cylinder, a piston rod, a main piston on the latter and two auxiliary pistons at each end of the main piston, and means for the additional members to slide freely through the main piston.

Grip Tread and Mud Shoe, Cortez V. Pugh, St. Louis, Mo., assignor of part to Edward Brockschmidt and others. It comprises a pair of endless chains on opposite sides of the wheel, having a plurality of chain grip treads each of which is provided with a base portion conforming to the tire. These mud shoes have a blade projecting outwardly.

Automobile Heater, Frank W. Dilks, Philadelphia, and Davis Reyam and Eugene E. duPont, Wilmington, Del., said Dilks assignor to said Reyam and said duPont. A casing is utilized to form a heating chamber and is pro-

Some Recent Efforts of Inventors Relating to Devices Applicable to the Motor Car, Including an Anti-Skid Chain, Tire Valve Lock, Tire Protector, Self-Starter and Bumper.

Spark Plug, Charles C. Eldridge and Edwin J. Beebe, Marshalltown, Ia. The main body of the shell of the plug is fitted with two extensions, these being so designed that the space between them and the central electrode may be altered as desired.

Lamp Attachment, Harry A. Lewis, Chicago. A hinged hood attachment for acetylene headlights projecting forward from the upper portion of the light and adapted to intercept the upwardly radiating rays from the source of light.

Wrench, Charles T. Melhorn, Amsbry, Penn. The shank of the wrench is provided with teeth which mesh with a pawl arrangement on the movable jaw of the tool and means are provided for engaging and disengaging the member.

Guy for Tops, Helen M. Ormsby, Xenia, O. An attachment plate is secured to the frame of the car or vehicle and a similar member has a stud adapted to engage with the permanent plate.

Lamp Cover, William T. Phillips, Berkeley, Cal. Flexible covers in sections are pivotally mounted on the support of the lamp and these are so constructed that the sections meet for locking. When the use of the lamp is desired these covers fold compactly and by means of a flap are protected from foreign elements.

Fuel Filter, Joseph Remi Tourangeau, Windsor, Ontario, Can. The device comprises an upper and lower compartment separated by a perforated partition. The fuel

vided with openings for the exhaust pipe, also tubes for air, as well as a hot air outlet and means for detachably connecting same.

Gearing, Joseph Dain, Ottumwa, Ia. A transmission device comprising a pair of discs which engage with a similar member, slidably connected to the crankshaft of the motor and operated by a lever. It is designed to secure a low speed and reverse only.

Automobile Starter, Wilbert B. Speice, Payne, O. A self-starting mechanism for internal combustion motors comprising a clutching device, a spring and two wheels and means for winding said spring and for throwing into and out of engagement the wheel actuating the crankshaft of the motor.

Tire Inflating Apparatus, Mason F. Stolberg, Toledo, O. A device for pumping up a tire by utilizing a friction wheel in contact with the revolving wheel of a motor car, said friction member actuating a plunger pump which is mounted upon a frame carrying the driven member.

Non-Freezing Water Device, Howard S. Campbell, Baltimore, Md., assignor of one-third to Jacob Zill and one-third to Percy Teixaira de Mattos, of the same city. A valve is incorporated in the circulation system of a motor and is fitted with an armature. An electro magnet is in proximity to the armature which is operated by a temperature actuated element. When a predetermined temperature is reached, the device automatically opens the valve and allows the water to drain out of the system.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

The Columbus Convention.

The members of the Columbus Motorcycle Club, Columbus, O., are planning a number of surprises in the matter of entertainment for the visiting delegates at the annual convention of the Federation of American Motorcyclists in that city, July 17-21. Among other things, there is to be a barbecue at Olentangy park, one of the most interesting suburban resorts in that section. Still another feature, but one that is being guarded as a great secret, is to be announced in connection with the gathering at the new motordrome, when the delegates to the convention will be the guests of the city officials.

Four Tourmasters Named.

The tourmasters for the four national tours have been named by President Hamilton as follows: Eastern, assembling at Albany, N. Y., R. S. Morton; southeastern, assembling at Baltimore, Md., J. A. Robinson; western, starting from Chicago, Jesse A. Campbell; southwestern, headquarters in Louisville, Ky., E. G. Baker. Two of these tourmasters have announced their itineraries as below:

Southeastern—July 14, Baltimore to Cumberland, Md., 138 miles; 15, Wheeling, W. Va., 132 miles; 16, Zanesville, O., 72 miles; 17, Columbus, 55 miles.

Western—July 15, Chicago to Fort Wayne, Ind.; 16, Springfield, O.; 17, Columbus.

More Amendments.

Among the proposed constitutional amendments which will come before the convention are the following:

Substitute for sections 1 to 12 of article IV of the constitution, the following: "For convenience of government this federation shall be divided into units comprising individual states, and in addition, as many districts as from time to time may be organized in Alaska, Philippine Islands, Hawaii, Porto Rico, Cuba, Mexico or any other foreign territory. All responsibility for the growth and development of the organization in each of these units shall be borne by a commissioner to be appointed by the national president, said appointment to be approved by the board of directors."

Amend section 1 of article V of the constitution to read: "The officers of the federation shall be a president, a secretary and a treasurer, who shall be elected for a period of one year, and commissioners for each state and foreign district, to be appointed as above provided for. The governing body of the federation shall be six directors, who, together with the two living

THE EMBLEM MANUFACTURING COMPANY

Also Makers of the Famous Emblem Bicycles.

ANGOLA ERIE COUNTY NEW YORK

preceding ex-presidents and president, shall constitute the board of directors."

Amend section 3 of the same article by striking out the words "the 11 vice presidents, one for each district."

Amend section 1 of article I of the bylaws by striking out "or the district vice presidents." Strike out section 2 of the same article.

Amend section 2 of article III to read: "The annual dues shall be paid to the national secretary," and to amend section 5 of article VIII by substituting for the word "president," the word "national secretary."

The effect of these changes will be to legislate the present district vice presidents out of existence. Still other amendments are to be offered providing for monthly reports of the state commissioners to the national secretary. It is held that the present plan of organization is too unwieldly to produce satisfactory results.

New England District Meeting.

The June meeting of the New England district, F. A. M., has been called for June 29, at the new clubhouse of the Providence Motorcycle Club, Providence, R. I. This is in the Swenson building at the corner of Broad and Blackstone streets, and the event will afford the members of the district a splendid opportunity to view one of the most up-to-date club headquarters in the country. The Providence club has planned a hill climb for the following day, and it is expected that the attendance at the meeting will be largely augmented as a result of this announcement. Of course, the chief business of the session is to nominate a candidate for vice president, although if the proposed amendments succeed at the national convention, it would appear that there will be little need for this action.

The Bosch Trophy.

The amateur motorcycle championships of the United States will be determined at the Columbus meet, in connection with the national convention. Last year, the Bosch Magneto Company, New York City, donated a handsome trophy, which was won by Frank Hart. This is a challenge award, known as the Bosch trophy, and the company now announces the point

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

system by which it will be awarded this year.

The winner of the one-mile championship will receive four points; the second place man, three, and

Ray Seymour and Percy Powers Riding Tandem on an Indian at Los Angeles.

the third, two. In the two-mile event, the winner will secure six points; second, four, and third, two. Other points will be gained as follows: Five-mile race—First, seven; second, five; third, three. 10-mile—First, eight; second, six; third, four. One-hour—First, 12; second, seven; third, five.

It will be necessary for the winner of the trophy to have competed in all events. In this manner, the man who secures but third place in the one-mile event, for instance, still stands a good chance of winning the trophy.

Mail for Delegates.

As was the plan last year, Secretary-Treasurer G. B. Gibson of Westboro, Mass., will act as chief postmaster for the delegates to the national convention. With Mrs. Gibson, he will be located at Hotel Virginia, on the second floor near the elevator, and all delegates and tourists are invited to send their mail in his care throughout the convention. The fiscal year of the federation will close July 1, at which time the officers will begin to make up their reports.

New Affiliated Clubs.

The following new affiliations are reported by Chairman E. M. Estabrook of the F. A. M. membership committee: Cream City Motorcycle Club, Milwaukee, Wis., 271; E. A. Sochurek, secretary, 764 Windlake avenue, 21 members. Motorcycle Touring Club, Philadelphia, 274; R. K. Hewitt, 1676 North 54th street, 12. Bound Brook Motorcycle Club, Bound Brook, N. J., 275; Dominick Boronio, Main street, 21. Humboldt Motorcycle Club, Chicago, 276; J. J. Peska, 3545 West North avenue, 47. Columbia Motorcycle Club, Columbia, S. C., 278; F. S. Hebenicht, 1101 Taylor street, 15. West Texas Motorcycle Club, Stamford, Tex., 279; E. E. Duke, 23. Austin Motorcycle Club, Chicago, 280; F. G. Sherman, 5502 Iowa street, 29. North Pennsylvania Motorcycle Club, Philadelphia, 281; N. A. Wheatley, 3301 Ridge avenue, 16. Indian Motorcycle Club, Mobile, Ala., 282; Oron Overton, 519 Dauphin street, 32. Union City Motorcycle Club, Union City, 283; Chauncy Beery, Franklin street, 18. Chanute Motorcycle Club, Chanute, Kan., 284; I. D. Meeker, 19 South Wilson street, 15. East Side Motorcycle Club, East St. Louis, Ill., 285; C. H. Heinz, 30. Indian Motorcycle Club, Cincinnati, O., 11; Joseph Thuenker, 433 Main street, 12 (reinstated).

Touring with an Emblem.

The Emblem Manufacturing Company, Angola, N. Y., maker of the Emblem mount, calls attention to the fact that its product is a decided favorite among those who are seeking a reliable machine for long distance touring. An accompanying illustration shows two of these vehicles in the hands of tourists on the road near Dunkirk, N. Y.

Increased Indian Production.

The Hendee Manufacturing Company of Springfield, Mass., maker of the Indian motorcycle, announces that up to June 1, it had shipped a few more than 13,000 machines for 1912, about 90 per cent. more than during the same period last year. The figures run about 65 per cent. twins.

New Track for Newark.

Newark, N. J., is to have a motorcycle track, C. A. Dunlap, for many years connected with the racing game, being one of the principals in the movement. Work on construction has been started, and it is planned to have it finished in time for a series of races, July 4. The increased interest in this branch

Emblem Tourists on the Road Near Dunkirk, N. Y.

of sport is shown from the fact that a new track is being built in Philadelphia, one near Coney Island, and two in the Middle West, at Detroit and Cleveland.

Manufacturers' Bi-Monthly Meeting.

At a June bi-monthly meeting of the Motorcycle Manufacturers' Association in Toledo, O., steps were taken for a motorcycle exhibition and demonstration at the Panama exposition in 1915. Secretary J. F. Cox was appointed to gather data for presentation at a future meeting. By voting to present trophies to every tourist who checks in on the last morning of the Columbus, O., run, the association showed its interest in the coming big event being arranged by the F. A. M. The manufacturers also voted to donate a trophy for the five-mile motorcycle championship, to be competed for annually at the national meets, the same to become the permanent property of the rider winning it three successive years. This event will be open to all F. A. M. amateurs.

The subject of two national shows at New York and Chicago was discussed, with a view to determining what course would be best to follow regarding independent motorcycle shows. It was decided that under certain conditions it would be best to hold shows concurrently with the automobile manufacturers.

Secretary Cox reported that practically all of the mayors of cities to whom letters had been sent advocating repressive measures against the open muffler had sent in replies promising co-operation. The Triumph Manufacturing Company was admitted to membership. The next meeting will be held in Detroit, Mich., Aug. 7. Those present were:

President A. B. Coffman, Yale; Secretary W. G. Schack, Emblem; J. W. Ash, Merkel; E. J. Knight, Thor; Arthur Davidson, Harley-Davidson; J. F. Cox, Pope; A. J. McCullom, New Era; Edward Buffum, Indian; W. F. Remppis, R-S; Don C. McCord, Flanders; W. A. Johnson, Pierce; H. T. Roberts, manufacturers' agent for motorcycle materials; S. A. Falor of the Goodyear Tire & Rubber Company and Mr. Welch of the United States Tire Company.

New Mount Coming.

Announcement has been made that the Davis Sewing Machine Company of Dayton, O., is to place a motorcycle in the market, and plans are being made for an output of 2500 machines the first year. The model is said to be completed. It is planned to equip the machines with Spacke motors, seven and nine horsepower, two speed. The output will be twins exclusively, chain drive, Troxel saddle, Schebler carburetor. The machines, to which no name has yet been given, will be marketed through dealers.

Cover Lock for Bosch Magneto.

The Bosch Magneto Company, New York City, is equipping its motorcycle magneto with a little device which will be appreciated by riders who have experienced the loss of the breaker box through the retaining spring jarring loose. On some types of mounts the belt is very close to the magneto and when the machine is operating at high speeds, it will vibrate laterally, moving the spring out of position with the result the breaker box cover is sometimes lost.

The new device is simple, consisting of a small ring. The cover, which is shown hanging free from the contact breaker box, fits snugly in the circumference of the casing in the usual manner. The cover is normally held in position by a flat spring which is shown in the illustration pushed to the left of the magneto as it would be if it were loose. The cover and casing are bored to take the ring which is large enough to allow sufficient freedom of movement so as not to interfere with the manipulation required for adjusting the contact points, etc.

Bosch Protecting Ring Device.

Wichita's Endurance Run.

A 168-mile endurance run was recently held by the Wichita Motorcycle Club of Wichita, Kan. Rules governing the run made almost perfect riding and machine work necessary, six riders, G. E. Woodwell, John Bronson, James Trimmel, Frank Honer, Wells Bennet and W. T. Cunningham receiving gold medals

ATTENTION MOTORCYCLISTS

Immediate deliveries of 1912 Indians, any Model. Cash or installment. Full line of equipments and supplies, also clothing for the Motorcyclist.

B. A. SWENSON

298 Blackstone Street, Providence, R. I.

The F. N. Shaft-Drive Motorcycles

Single cylinder with two-speed gear and handle bar control of clutch.....$275.00
(The only machine in the world possessing this incomparable feature.)

Four cylinder ordinary automobile engine, compound spring fork, two powerful brakes, footrests if specified, combined luggage carrier and stand, long wheel base and large tires.....$350.00

AMERICAN F. N. COMPANY Boston, Mass.

Branches: 49 Union St., Prov., R. I. 415 Trumbull St. Hartford, Ct.

Digitized by Google

for perfect scores. There were three classes, private owners, trade riders and professionals. G. E. Woodwell was first among the private owners, John Bronson of the trade riders, and Wells Bennet led the professionals. The schedule was 20 miles an hour.

Merkel's New Addition.

An accompanying illustration shows the officials of the Miami Cycle & Manufacturing Company and invited guests performing the ceremony of breaking ground for the big new addition to the plant in which the Merkel mounts are manufactured. It is anticipated that this will be ready for occupancy in time to take care of the 1913 production. It will afford 55,000 square feet of floor space, and will be four stories in height. In explanation of the picture, it may be stated that the numbers refer to the following individuals: 1, K. R. Jacoby, president and general manager; 2, A. H. Walburg, vice president; 3, H. S. Wise, treasurer; 4, James W. Ash, secretary and manager of sales; 5, F. L. Valiant, advertising and assistant sales manager; 6, F. F. Merkel, chief engineer; 7, C. F. Miller, superintendent; 8, W. D. Andrews, Buffalo distributor, and 9, J. F. Stener, Pacific coaster brake missionary.

Breaking Ground for New Merkel Factory: 1, President Jacoby; 2, Vice President Walburg; 3, Treasurer Wise; 4, Secretary Ash; 5, Advertising Manager Valiant; 6, Chief Engineer Merkel; 7, Superintendent Miller; 8, Buffalo Distributor Andrews; 9, J. F. Stener.

Another Reward Paid.

Treasurer G. B. Gibson of the F. A. M. has just drawn his check for $25 in favor of Deputy Sheriff Chapman of Onondaga county, New York. The latter caused the arrest and conviction of Leslie Lusk for stealing the motorcycle of J. Harry Towne at Baldwinsville, N. Y., April 12. This reward was paid in accordance with the policy of the F. A. M. in such cases.

Boston and Not Providence.

Elsewhere in this issue is an announcement that the June meeting of the New England district, F. A. M., is to be held in Providence, June 29. Since this was written, the meeting was called for Boston, at the rooms of the Boston Motorcycle Club, 206 Massachusetts avenue, for the same evening. The club will hold a hill climbing contest at Arlington on June 29.

Club Notes, Here and There.

A new motorcycle club has been organized at Winona, Minn., with James Jenson, president.

A successful economy test was recently held by the Washington, D. C., Motorcycle Club on the White House ellipse.

The Chicago Motorcycle Club, in co-operation with the automobile organizations in that city, is backing a movement to obtain legislation requiring all motor vehicles to halt when approaching a street car which has stopped to permit passengers to alight or to board.

Two hundred members of the Dayton Motorcycle Club, Dayton, O., are expected to attend its annual banquet, Feb. 1, 1913.

The Maryland Motorcycle Club and the Touring Club of Maryland, together with other motorcycle clubs in Baltimore, recently held their first Sunday run to Annapolis. Fifty riders made the trip.

E. Mitchell Dodson has been elected president of the National Motorcycle Club of Washington, D. C.

The New Jersey Motorcycle Club is planning a lantern parade. President Post has named the following to make the arrangements: Peter Cunningham, Seth Eberhardt, George Riechey, John Beevers, Roy Pascal, Carl Segelbach, A. W. Brown, William Obert and Howard Hill. The club will hold a run from Newark to Asbury Park, July 4.

An excellent programme has been arranged for the races at Pablo Beach, near Jacksonville, Fla., July 4.

Swenson's Building Opened.

The formal opening of the new Swenson building, the Indian Wigwam, at Blackstone, Friendship and Broad streets, Providence, R. I., was held June 15-16. Several riders from all over the East, including a number from New York, Springfield and Boston, were present. The building is owned by B. A. Swenson, Rhode Island agent for Indian mounts, made by the Hendee Manufacturing Company, Springfield, Mass., and is one of the most modern in its appointments. The salesroom and repair shop were both thrown open for inspection, and the guests were liberally entertained by Mr. Swenson.

PROF. HOSFORD IS MANAGER.

The many friends of Prof. Winthrop C. Hosford, M. E., chief instructor of the Boston Y. M. C. A. automobile school, will be glad to learn of his promotion to become manager of this institution. The school itself enjoys the distinction of being the first of its kind in America, and its reputation has been such as to place it in the very front rank of progressive and effective institutions of this character.

Prof. Winthrop C. Hosford, M. E.

Prof. Hosford has served for several years as chief instructor, and the constant and growing success of the school is attributed largely to the system and methods employed by him. Over 5000 men,—chauffeurs, operators and others connected with the industry in various capacities—can testify to his skill as a teacher and to his genial personality.

Born in New Britain, Conn., Prof. Hosford entered a machine shop at the age of 16. During the next four years he studied machine drawing and designing evenings. He entered the automobile field in 1898, when he became identified with the New England Motor Carriage Company. For the past 14 years he has been connected with the industry continuously in some capacity.

The promotion comes as a fitting tribute to his energy and painstaking efforts on behalf of the school. He is not only a hard worker, but studies constantly, keeping abreast of the improvements and developments of the modern automobile. In his work he is assisted by 16 instructors, all of whom are trained and experienced in their respective branches. In this manner the highest possible standard is maintained at all times.

CORRECTION OF ERROR.

In connection with an illustrated announcement of John H. Kelly's appointment as sales manager of the Republic Rubber Company, maker of Republic tires, in the issue of The Automobile Journal for May 25, the address of the concern was stated as Akron, O., instead of Youngstown, O. There are a large number of tire manufacturers located in Akron, but Youngstown also is a rubber centre of some note, and the Republic Rubber Company has done its full share toward bringing about this result.

JOINS MICHIGAN FORCES.

W. H. Cameron, for four years chief engineer with the Willys-Overland Company, Toledo, O., has accepted a similar position with the Michigan Buggy Company, Kalamazoo, Mich., maker of Michigan cars. Mr. Cameron is well known throughout the entire industry as one of the foremost engineers and designers in America, and the Michigan concern is to be complimented upon securing his services.

He may be regarded as a pioneer in the development of the automobile industry, and brought thereto a splendid practical experience in various lines of higher mechanics, an experience which placed him in a leading rank in the matter of motor car science.

In 1902 he was with the Daimler Automobile Company of Long Island City, N. Y., a concern that was at that time engaged in the production of the American Mercedes. From that position he joined the forces of the Packard Motor Car Company, about the time it was building its Detroit factory. In 1904 he went to the Olds Motor Works in Detroit, and when that plant was removed to Lansing, Mr. Cameron went to Indianapolis to take charge of the automobile work of the Nordyke & Marmon Company. Two years and a half later he became associated with the Gibson Company of Indianapolis, and joined John N. Willys in the manufacture of Overland cars in 1908.

Under Mr. Cameron's guidance the plans for enlarging the production of Michigan cars will be put into effect at once. These plans are the result of the Michigan car's remarkable success in the market during the past three years; in fact, since the first car of this make was duly announced. With the Michigan Buggy Company's large resources, its live, progressive policies and its immense factory facilities, Mr. Cameron has an unexcelled field for his future work.

W. H. Cameron, Chief Engineer, Michigan Buggy Company.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

Gotham Sporting Goods Company, New York City; $10,000; to deal in motorcycles, automobile supplies, etc.; incorporators, Benjamin Goodman, Henry Ephriam, Ben Stacy.

The Veitch Motor Manufacturing Company, New York City; $200,000; to manufacture motors, automobiles, motor trucks, etc.; incorporators, James S. Harris, Percival J. McIntosh, Charles H. Toy.

Northern Motor Car Company, Albany, N. Y.; $25,000; incorporators, R. Dudley Cannon, Arthur P. James, J. Somers McClellan.

Robert Stock Auto Spring Wheel Company, New York City; $300,000; incorporators, Robert Stock, Augusta M. Stock, Joseph F. Bokelman.

American Carburetion Company, New York City; $5000; to manufacture carburetors and parts thereof; incorporators, William H. Woolley, Albert G. Hubbell, James F. Bisselle.

The Walden Aeroplane Company, New York City; $10,000; incorporators, Joseph M. Gottesman, Henry W. Walden, Louis Green.

Audubon Auto Service Company New York City; $500; incorporators, Michael P. Caffe, Edmond Huerstel, Julius M. Ferguson.

Kirchner Motor Company, Poughkeepsie, N. Y.; $2500; incorporators, Otto Kirchner, Charles Kirchner, John E. Townsend.

A. B. Manufacturing Company, Poughkeepsie, N. Y.; $200,000; incorporators, Max A. Kotzen, Jacob Lichtenstein, Ralph H. Raphael.

Whiteboro Motor Car & Garage Company, Utica, N. Y.; $1000; incorporators, J. Webster Rogers, Mabelle G. Malsan, Adrian S. Malsan.

Stanley Automobile Company, Louisville, Ky.; $2000; incorporators, E. C. Walker, George H. Laib, W. B. Young.

Auto Repair Company, Savannah, Ga., $10,000; incorporators, Shelby Myrick and others.

C. D. Franke & Co., Charleston, S. C.; $250,000; incorporators, Emil H. Johnz and Julius H. Johnz.

Robinson Automobile Company, Charleston, S. C.; $20,000; incorporators, C. B. Hulet, Walter B. Wilbur, J. T. and V. F. Robinson.

Fiat Motor Car Company, Memphis, Tenn.; $20,000; incorporators, O. C. Fleumer, Nelson E. Taylor, H. O. Bell, J. W. Kirkpatrick and J. E. McCadden.

Newark Auto Truck Manufacturing Company, Newark, N. J.; $500,000; incorporators, L. W. Babbage, H. H. Poole, J. T. Walsh.

Brooks Motor Car Company, Buffalo, N. Y.; $100,000; incorporators, H. G. Rechtsteiner, G. B. North, E. O. Kerr.

Automobile Sales Corporation, Camden, N. J.; $30,000; incorporators, P. L. Neel, J. R. Shoch, H. R. Shoch.

Ohio Motor Car Distributing Company, Chicago, Ill.; $5000; to manufacture and deal in automobiles, motor vehicles, bicycles, etc.; incorporators, Joseph Slotow, Samuel C. Wood, Fred C. Churchill.

A. S. Lee Company, Providence, R. I.; $5000; incorporators, Daniel J. Healy, H. Ladd Walford and G. Otis Washburn.

V. C. Motor Truck Company, Kittery, Me.; $100,000; incorporators, Horace Mitchell, C. E. Smothers, William E. Fisk.

Smith Bros. Garage, Inc.; Melrose, Mass.; $1000; directors, Rufus W. Smith, Rufus W. Smith, Jr. L. A. Smith.

Dunn Flyer Company, Boston, Mass.; $50,000; aerial craft, etc.; directors, Stephen C. Burgoyne, C. D. Woodbury, R. Cushman.

Hubmark Rubber Company, Boston, Mass.; $25,000; to manufacture rubber goods, tires, etc.; incorporators, George H. Mayo, O. W. Smith, W. H. Mayo.

Perfection Aero-Navigation Company, Pittsburg, Penn.; $200,000; incorporators, Dyke Smith, Joseph Sinkovitz, W. L. Mooks.

Everitt Motor Car Company, Wilmington, Del.; $3,000,000; incorporators, Byron F. Everitt, Paul Smith, Harry W. Davis.

WITH THE MANUFACTURER.

The Stevens-Duryea Company, Chicopee Falls, Mass., is erecting a four-story brick and steel building 508 feet long, with frontage of 80 feet on Page boulevard, East Springfield. The quarters are to be used for the body building and painting departments.

H. N. Hovey and T. C. Starret of Detroit have secured the entire stock of the Simplex Motor Car Company, manufacturer of the Amplex car, with headquarters at Mishawaka, Ind., the 30 or more stockholders turning in their stock, rather than stand a pro rata assessment. Mishawaka people are hopeful that the action will save the concern for their town and that it will not be moved to Detroit as it was planned to do at one time. Operations will be continued on a small scale until reorganization. Present plans are to capitalize for $1,000,000.

The Federal Rubber Manufacturing Company of Milwaukee, Wis., is planning a six-story addition to its plant at Cudahy. The building will be 400 by 100 feet, and will give the company double its present capacity. The total floor space now occupied is 170,000 square feet. From a payroll of 38 men last July, when the Cudahy plant was taken over, the Federal company has increased its business, so that now it has a factory force alone of 428 men, which, with the sales force and engineering corps, brings the number nearly to 600.

Pratt, Carter, Sigsbee & Co., of Detroit, motor truck manufacturer, is reported to be arranging for larger factory quarters and will increase its equipment.

The Castle Lamp Company of Amesbury, Mass., maker of automobile lamps, denies the report that it is to remove to Richmond, Ind. H. J. Quinn, general manager of the company, says that no factory site has been purchased there or in any other place.

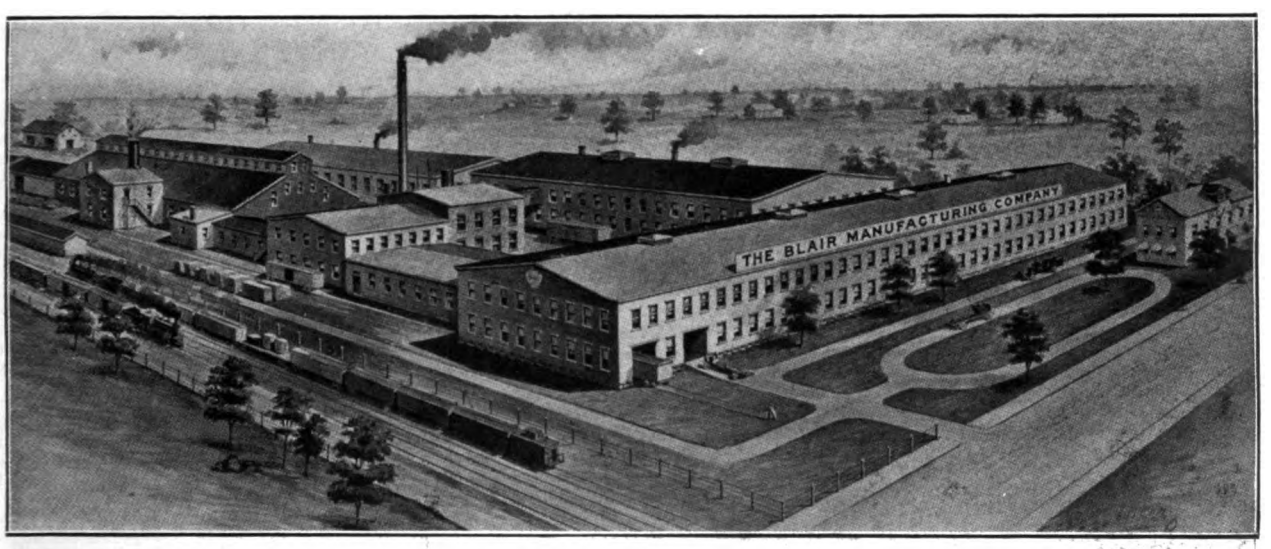
John A. Graham, at one time superintendent of assembling and testing at the Brightwood Motor & Manufacturing Company of Springfield, Mass., was recently appointed engineer and superintendent of the Westfield Motor Truck Company, Westfield, Mass.

The England Manufacturing Company, maker of metal stampings and automobile accessories, formerly located in Amesbury, Mass., recently removed to Detroit, taking the old factory of the King Motor Car Company at 1559 Jefferson avenue.

The General Aluminum & Brass Castings Company is the name of a new concern which will erect a huge plant at Grand boulevard and St. Aubin avenue, Detroit, to manufacture castings and other parts for the automobile trade. Frank C. Root, who was identified with the Aluminum Castings Company, and capitalists from Detroit and Cleveland, will be identified with the venture.

Matthew B. Morgan, an automobile engineer, who has been with the Chalmers Motor Company of Detroit, Mich., for the past three years, has joined the Marion Motor Car Company force at Indianapolis, Ind. Morgan's ex-

Digitized by Google



perience, covering a number of years, took him through employment with the Peerless Motor Car Company of Cleveland O., Packard Motor Car Company of Detroit, Mich., and the Olds Motor Works, Lansing, Mich.

J. J. Cole, president of the Cole Motor Car Company of Indianapolis, Ind., for which the G. E. & H. J. Habich Company of Boston is the Massachusetts distributor, and William Colt of the Colt-Stratton Company, New York City, eastern distributor for the Cole, were recent guests of automobile men in Boston. Dinner was served at one of the leading hotels, following which there were interesting addresses by the guests and a number of Boston business men.

The Abbott Motor Company of Detroit, Mich., recently purchased a large plot of land, adjoining its present factory buildings in that city. The work of erecting permanent, finely equipped buildings will be started soon. The move was made necessary by the firm's proposal to increase its output of motor cars 25 per cent. during the current year.

John F. Singleton, for the past six years advertising manager for the Firestone Tire & Rubber Company at Akron O., has organized the John F. Singleton Company and has opened offices in Cleveland, O. The new concern plans to conduct a general advertising agency business.

The Blair Manufacturing Company, Newark, O., maker of the worm driven Blair truck, is now installed in its new factory, a general view of which is shown in an accompanying illustration. The plant is admirably arranged for this work, and is thoroughly equipped in the most up-to-date manner. Every modern manufacturing facility is incorporated for the rapid production of 1.5, 2.5 and 3.5-ton models.

Plant of the Blair Manufacturing Company, Newark, O., in Which the Blair Worm Drive Trucks Are Produced in Three Models.

The Union Motor Truck Company was recently formed in Sunnyvale, Cal., for the purpose of manufacturing and placing on the market commercial vehicles. The officers are: President, C. Y. Williams; vice president, Ernest Horstman; secretary, W. P. Buckingham; treasurer, Edgar Pomeroy. A large amount of new machinery will be purchased.

The Penn Motor Car Company has just completed the removal of its plant from Pittsburg, to Newcastle, Penn. All the machinery from Pittsburg, together with a large amount of new machinery, has been installed, and the company has resumed operations.

The Motor Manufacturing Company of Geneva, N. Y., is removing its plant to Dunkirk, and will occupy a part of the Lux Light plant in the latter city. The firm will employ about 100 men in its new plant.

E. D. Bangs of Milwaukee, Wis., is organizing a stock company for the purpose of manufacturing an elastic rim, perfected by Mr. Bangs, for holding solid tires on automobile wheels. Mr. Bangs announces that it will be at least a month before all the details of the new concern are completed. According to a statement by him the resiliency of the new device can be adjusted to suit any conditions.

Henderson Motor Car Company, Indianapolis, Ind., maker of the Henderson car, which made its initial appearance in Indianapolis on the day of the 500-mile race, has found it necessary to provide for almost twice the original approximated output, and has increased its capitalization from $100,000 to $200,000.

The Dayton Engineering Laboratories Company, Dayton, O., operates two factories, one of which is located in Chicago and the other in Dayton, O. The latter is presented in an illustration herewith. It is in this plant that the Delco self-starting and lighting systems are manufactured, while the ignition equipment is produced in the Chicago plant. The entire building shown is well fitted for the work, being equipped with all of the most modern machinery. A particular feature of the construction lies in the fact that the workmen are supplied with an abundance of light and special attention is paid to the matter of ventilation.

GARAGE AND DEALER.

W. C. Durant recently arranged for the opening of branches of the Chrevolet Motor Company of Detroit, and the Little Motor Car Company of Flint, Mich., at Buffalo, N. Y. A large store has been leased and Joseph F. Rath has been appointed representative for the two companies in the district including Buffalo and surrounding territory.

The Urbana Automobile Company of Urbana, Ill., will erect an addition 100 by 50 feet to its garage. It will be of brick and concrete construction, and will give the company a floor space of 12,000 square feet. The garage is one of the best equipped and most finely appointed in the vicinity

The Seely Auto Sales & Training School of South Bend, Ind., will have new quarters at 232 North Michigan street, which will be among the finest of its kind in Indiana when completed. The basement will be used exclusively for training purposes, while the main floor will be utilized for garage and general salesrooms. Complete storage and recharging apparatus for electric machines will be installed.

Capt. F. W. Cole of the Pan-American Motors Company of San Francisco, Cal., has taken the agency for the Durable Dayton truck, built by the Dayton Auto Truck Company of Dayton, O. His territory will include California, Oregon and Nevada.

S. R. Smith has opened a new garage at 198 Church street, Poughkeepsie, N. Y. The building is a fine brick structure, and is up-to-date in every way. It has the capacity for caring for 80 automobiles.

C. D. Warner has disposed of his automobile business, conducted for a number of years on Arsenal street,

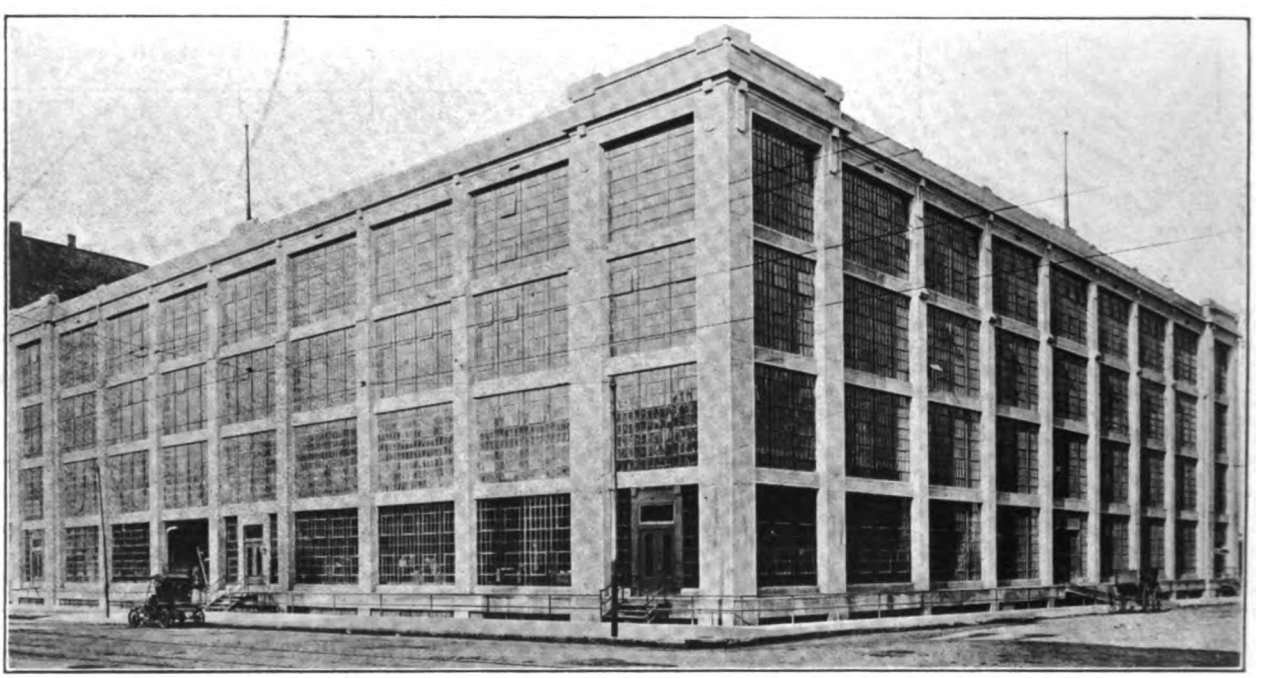
Digitized by Google

Watertown, N. Y, to Ralph Wise, Louis Mitchell and Fred Folger. Mr. Warner has had the agency for the Ford car, built by the Ford Motor Company, Detroit, Mich.

T. E. Smith, who has taken the agency for several makes of cars, is having a garage built at Ridgefarm, Ill. The new structure will be modern in every detail and will be strictly fireproof.

The Menard Company has opened a new garage on Division street, Holyoke, Mass. It has a capacity of 30 automobiles, and among the improvements to the building are a concrete floor and the installation of an electric lighting system.

Barney Gilinsky, one of the best known business men in Council Bluffs, Ia., is having erected a pressed brick structure, 65 by 115 feet, one story in height, at the corner of Broadway and Eighth streets, which will be used as a garage and automobile supply and service station. It will be managed by his son, Joseph Gilinsky.



Marion Brown has installed new machinery in his garage at Graniteville, N. Y.

The J. H. Hansen Company is to open a new service station at 225 South St. Joseph street, South Bend, Ind. The building has been entirely remodelled and will be made by the Packard Motor Car Company of Detroit, and has started the erection of a sales service building at Vermont street and Capitol avenue, Indianapolis. The structure will be one of the most complete of its kind in the Middle West.

W. K. Chetwood, who went to Portland, Ore., about a year ago from San Francisco, Cal., to represent the Kelly-Springfield Tire Company of New York City, has opened headquarters in a building at 328 Pine street. Mr. Chetwood is one of the best known men on the Pacific Coast, being familiar with the trade in all the larger cities.

The Sturdy Manufacturing Company of Chicago, maker of the Sturdy spark plug, has granted the Cedar Rapids Sales Company, Cedar Rapids, Ia., the exclusive sales right of its product in the State of Iowa. An office has been opened at Avenue A and Fourth street in the latter city.

The Enterprise Motor Truck Company was recently incorporated in Baltimore, Md. G. H. Nachman of the Enterprise Fuel Company, Hanover and Fayette streets, is one of the principal owners of the new concern. A contract for the erection of a garage at Oak and 20th

Factory of the Dayton Engineering Laboratories Company in Dayton, O., Where the Delco Starting and Lighting Systems Are Made.

used as a show room for the Abbott-Detroit, made by the Abbott Motor Company, 612 Waterloo street, Detroit, and the R-C-H, manufactured by the R-C-H Corporation, Detroit.

Frank E. Block is having an automobile salesroom, 100 by 100 feet, two stories high, erected in Atlanta, Ga. The building will be of mill construction, will have two steam plants for heating and will be lighted by electricity. The cost, it is said, will be $25,000.

F. L. Niell, well known to the automobile trade throughout the State of Pennsylvania, recently purchased the Auto Supply Company's business, conducted by Ross Leonard in Washington, Penn. He will continue the business at its present location, Main street and Highland avenue.

J. S. Fowler of Anderson, S. C., in addition to being one of the largest cotton growers in the United States, and also a big corn raiser, has established the reputation very recently of being the most successful automobile salesman in his state. During the last year he has sold $200,000 worth of machines.

Carl G. Fisher, president of the Indianapolis motor speedway, has taken the agency for the Packard car,

streets has been awarded and the work will be commenced at once.

John S. Bridges has plans under consideration for the erection of a garage at Charles and 35th streets, Baltimore, Md. The building is to be of two stories and will cost $2500. The contract has been awarded to Gladfelter & Chambers.

The Capitol City Auto Company of Hartford, Conn., found it necessary recently to secure larger quarters, and salesrooms have been opened at Allyn and High streets, affording increased floor space for the storing and demonstration of machines.

The Harvard Garage Company has been formed in Boston with a capital stock of $5000. One hundred shares at $50 each have been issued. The directors are: E. F. Blake, John B. Lynch and W. E. Collins.

Commercial Motors Company, with headquarters at 432 E. Broadway, Louisville, Ky., was recently organized with the following officers: President and treasurer, Harry B. Fitch; vice president and manager, R. C. Hurt; secretary, R. E. Scharf. The company will conduct an automobile service station, and is incorporated for $10,000.

WEED CHAIN DECISION.

Judge Coxe, in the United States court of appeals for the second district, sitting in New York City, handed down a decision June 7, in an action brought by the Weed Chain Tire Grip Company, and others, against the Atlas Chain Company. The case was brought before this court on an appeal by the defendant. It hinges upon the interpretation of the so-called Parsons patent, granted to Harry Parsons, March 24, 1903, for an improved "anti-slipping and anti-puncturing device for the tires of vehicles and like purposes," and employed in Weed chains. The opinion of Judge Coxe is of special interest and is in part as follows:

The device which is the subject of the patent consists of a network of rings, or strips of metal, or a series of small chains, or bands, fitted loosely over the periphery of the wheel or passing from side to side across the tire and prevented from coming off by two rings, hoops, or their equivalent, such rings, or one of them, being provided with means of attachment and detachment. The said rings are smaller in diameter than the periphery of the wheel and cannot come off accidentally. The rough surface provided by the network, chains or the like, will prevent the slipping of the tire on the road and the consequent skidding of the tire.

It is probable that the genius of the inventor will yet devise a more simple and efficient method of preventing the skidding of rubber tired vehicles, but so far as the art has developed, Parsons appears to have been the first to provide means which minimize the greatest danger which confronts the traveller in such vehicles.

The first claim of the patent, which is typical of the other five, is as follows: "Anti-slipping or protecting means for the peripheries of wheels, pulleys or the like, comprising attaching elements at opposite sides of the wheel, and an anti-slipping or protective medium secured to the attaching elements and extending across and around the periphery of the wheel, said parts being disconnected, though retained on the wheel whereby the anti-slipping or protective medium is free to move or shift its position around the periphery thereof."

It is said that the words, "fitting loosely over the periphery of the wheel," in the description and the words, "free to move or shift its position around the periphery thereof," in the claims, require a construction that the cross chains shall be so loose that they must necessarily hang in loops from the supporting wires and be successively laid down upon the ground immediately in front of the tread of the tire. There is nothing in the prior art requiring such a construction, and, if adopted by the court, it will enable any chauffeur who has wit enough to contract the circumferential support so that the cross chains are drawn more tightly across the tire, to evade the patent with impunity. "Loosely" is here used in contradistinction to "tightly" and means that the cross chains must be sufficiently loose to secure the advantages of the invention; viz., to creep and not pound the road as they would do if rigidly fastened to the wheel, when travelling at a high rate of speed.

That the defendant's grip creeps is expressly admitted, as is also the contention that if by use the cross chains become loose so that they are free to move or shift their position around the periphery of the wheel, the device becomes an infringement. It is also clear that the defendant's device may be so adjusted that the chains are held loosely, and if the driver of the car becomes satisfied that the best results can only be attained by a loose adjustment, it is more than probable that he will adopt that method. In other words, the defendant places in the hands of the chauffeur an apparatus which may infringe or not, according to whether it is wound up loosely or tightly. When the defendant sells a device, the natural, usual and preferential use of which constitutes an infringement, it is no answer to assert that it is possible, by limiting its efficiency, to use it innocently.

We cannot avoid the conclusion that the changes made by the defendant are attempts to secure the fruits of Parsons' invention by alterations in non-essential details.

The history of the protracted litigations shows that, with few exceptions, the courts have regarded the Parsons invention as a meritorious one and have given it a construction sufficiently liberal to include all changes of form which accomplish the same result in substantially the same way.

The defendant was practically selling the patented grip in all its essential details, but in addition it provided tension springs with directions to make a tight fitting grip. The springs may or may not be used, and the directions may or may not be followed, but even if they are followed, the same result is obtained, only in a less degree; the circumferential creeping of the cross chains is not so marked.

Believing the invention to be a meritorious one, we decline to limit the claims as practically to invalidate the patent.

TRUFFAULT-HARTFORDS IN RACING.

Special attention is being paid to the matter of accessories fitted to cars taking part in the important racing events this year, and it is of particular interest to note that Truffault-Hartford shock absorbers, made by the Hartford Suspension Company, Jersey City, N. J., were employed on all of the first nine prize winners in the recent 500-mile race on the Indianapolis motor speedway. Dawson's National, which won the first prize, utilized a double set of these shock absorbers, and it is stated that they aided materially in making it possible to maintain an average speed of 78.72 miles an hour. In accordance with its announcement the Hartford Suspension Company has paid the following special prizes as the result of the work done by Truffault-Hartford equipped cars in this event: First, Dawson, National, $250; second, Tetzlaff, Fiat, $150; third, Hughes, Mercer, $100.

DAUGHERTY WITH MICHIGAN.

Following the announcement that W. H. Cameron has been appointed chief engineer of the Michigan Buggy Company, Kalamazoo, Mich., maker of Michigan cars, comes the information that George H. Daugherty, formerly with the Lord & Thomas advertising agency in Chicago, has become advertising manager of the same company. Mr. Daugherty has had 10 years' experience in the advertising field, having been with the Long-Critchfield Corporation, previous to his connection with Lord & Thomas.

R-C-H IN DEMAND ABROAD.

Since the first R-C-H car was shipped from the factory of the R-C-H Corporation, Detroit, a little over six months ago, it has achieved considerable popularity abroad. At present dealers are handling it in 28 different countries, with hundreds of cars in operation. This representation is not confined to any one section of the globe, for the cars are to be seen on every continent and in all the principal countries. All the cars are shipped complete, with the regular bodies, in contrast to much of the export trade in automobiles, which is in the chassis alone, the bodies being built abroad according to foreign ideas.

REPUBLIC TIRES IN CLEVELAND.

To care for its rapidly growing trade in the district, the Republic Rubber Company of Youngstown, O., maker of Republic tires, recently opened a factory branch at 5919 Euclid avenue, Cleveland. The new branch is to be in charge of B. C. Swinehart, who has been situated at the factory for the past 2.5 years, where he has charge of the solid tire department, and who will continue this work in addition to his new duties. He has been closely associated with the rubber business for the past 12 years.

TEXAS LONG HORN E-M-F.

An accompanying illustration presents a 30 horsepower E-M-F, which the owner, C. F. Blumberg of Seguin, Tex., claims to have driven over 40,000 miles during the past three years, as it was about to leave its Texas home for a cross country trip to the Studebaker Corporation's E-M-F factory in Detroit for an overhaul. The car has been renamed the Texas Long Horn, and a pair of such horns is to be noted at the front of the hood. There is a story connected with this.

Texas Long Horn E-M-F, Now on an Overland Trip to the Detroit Factory.

Throughout its career this E-M-F has been the personal car of Mr. Blumberg, whose duties carry him daily on a wide range, and considerable night riding has been necessary. During one of these night trips, the machine collided with a big Texas steer, which had lain down on a shady portion of the trail. The horns were preserved and have decorated the hood ever since.

On the cross country trip, Mr. Blumberg will be accompanied by his two sons, Otto and Charles. The three men are making the trip as a vacation, and because they feel that it is a duty they owe to the car.

CLIMBS MT. HOOD IN REO.

F. W. Vogler of Portland, Ore., exceeded all previous records in a recent test in which he drove a Reo car, made by the Reo Motor Car Company, Lansing, Mich., to the government station near the top of Mt. Hood, 10,000 feet above the sea level. In many places along his trip he passed through snow five feet deep.

COTTON IN AUTOMOBILE INDUSTRY.

If one were to say that the automobile and cotton industries are very closely allied, there are few people who would not have to stop to think before they could determine whether this were so, and still over 1,000,000 bales of cotton are used annually in the manufacture of automobiles. B. C. Spitzley of the Abbott Motor Car Company of Detroit, Mich., has compiled some interesting figures with regard to the use of cotton in connection with the motor vehicle.

"Steel is the only manufactured product that exceeds cotton in importance in this country," he says. "Cotton enters into the manufacture of more articles of commerce than any other commodity except iron and steel and if you were to eliminate the stoppage of spindles and looms it would be but a trifle compared to the paralysis that would visit countless other industries. Motor cars require more than 1,000,000 bales of cotton annually, of which 400,000 bales are used in the manufacture of tires and protectors; 10,000 for stuffing and upholstering while the remainder is used in making auto clothing, slip covers, insulating wires, tool bags, tool rolls, waste and mercerized rain clothing. For simply filtrating automobile lubricating oil alone millions of yards of 40-inch wide ducking is used annually to say nothing of the vast number of cotton or canvas covers made to put over cars."

BUICK WINS TAHOE TROPHY.

The Lake Tahoe Tavern Company's trophy, offered to the first car that would reach Lake Tahoe, Cal., this season, was won recently by a Buick model 35, built by the Buick Motor Company of Flint, Mich. The car was driven by a Mr. Gross of the Howard Automobile Company of San Jose, and contained J. E. Sloan, agent for the Buick car in San Jose and Palo Alto, and Bert Lawton, a mechanic from the service department of the Howard company. Snow was first encountered two miles above Tolles and at a point near the summit, its depth had increased from 12 to 16 inches, at which point it was drifted badly in places.

Digitized by Google

EVERITT MOTOR CAR COMPANY.

The various rumors concerning the reorganization of the Metzger Motor Car Company, Detroit, maker of Everitt cars, appear to have been set at rest by the incorporation of the Everitt Motor Car Company, under the laws of Delaware, for $3,000,000, by Byron F. Everitt, Paul Smith and Harry W. Davis. The new concern has taken over the manufacture of the Everitt. It may be mentioned, in passing, that the old company was capitalized for $1,000,000.

As yet no definite plans have been announced. A large number of men formerly connected with the Studebaker Corporation have joined those associated with the Metzger Motor Car Company. B. F. Everitt is president and Paul Smith vice president. The latter formerly was sales manager of the E-M-F and Flanders business of the Studebakers. W. E. Flanders, whose name has been associated with the new concern, is said not to be directly connected with the enterprise. Vice President Smith, who also is sales manager of the Everitt Motor Car Company, makes the following statement:

"No new models are contemplated nor any changes, even the slightest, will be made, either in the mechanical features, prices or in any other way. The advent of the Flanders group in the Everitt company simply means that the capital has been increased from $1,000,000 to $3,000,000, and this means three times the factory capacity and three times the output. In short, it will relieve any condition which has confronted our dealers everywhere and will enable them to meet more nearly the demand for Everitt cars than they have been able to do in the past."

It may be added that a large number of managers of Studebaker branches throughout the country have resigned to follow their superiors into the new venture. Among the other news items in this connection, is that of the promotion of Harry Bill, formerly general manager of the Metzger Motor Car Company, to become general manager of the Tudhope Motor Car Company of Orillia, Can., the Canadian company manufacturing Everitt cars. He has taken with him Joseph Gardham, formerly of the Chalmers plant, as factory manager.

NATIONAL RETIRES FROM RACING.

George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, Ind., announces that National cars will not be entered by the factory in any more racing contests during the year 1912. This comes after due consideration on the part of the company, and the officials declare they will need all of their energies to take care of the increased demand for National cars as a result of the consistent winning of these machines during the past few years.

The National now holds the international championship, as a result of winning the 500-mile race at Indianapolis, Memorial Day; the world's stock championship, and several other marks in road racing, hill climbing and speedway events. The announcement with respect to 1912, is stated by the company to have no bearing upon the situation for 1913 or any other year.

AUTOMOBILE CLUB OF AMERICA.

Frederick W. Whitredge of New York was recently elected president of the Automobile Club of America at the annual meeting in New York City. Other officers chosen were: First vice president, Henry Evans; second vice president, Henry R. Taylor; treasurer, Dudley Olcott, 2d; secretary, W. A. Edwards. The following chairmen of committees were named: Executive, Henry Evans; entertainment, Henry R. Taylor; membership, Edward S. Pearson; aviation, James A. Blair, Jr.; contest, William K. Vanderbilt, Jr.; technical, Frederick R. Hutton; law and ordinance, W. W. Miller; good roads, A. R. Shattuck; foreign relations, Dave H. Morris; power boat, Frederick W. Whitredge.

JOHN DREW BUYS HUDSON.

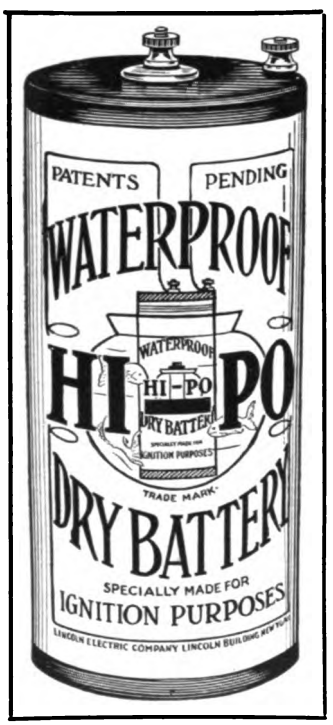
A fine tribute has been paid the American made automobile by John Drew, the actor. After using high priced foreign cars for years, he recently became owner of a self-starting Hudson, made by Hudson Motor Car Company, Detroit. His manager, John Henry Mears, who was an automobile engineer before he entered the theatrical profession, also has purchased a Hudson.

PARKWAY ADDITION OPENED.

Forty miles of beautiful parkway and excellent roads are provided motorists by the formal opening of the Long Island motor parkway, which took place May 31, when William K. Vanderbilt was a host at a function which included a complete inspection from Great Neck Lodge to a section near Lake Ronkonkoma. There is no speed limit on the parkway, and it is claimed to be free from dust. By the time it is finished it is estimated that fully $500,000 will have been spent, as $300,000 has been expended to date.

ORGANIZE IN NEW LONDON.

Given an impetus by the New London Business Men's Association, the Automobile Club of New London, Conn., was formed recently, with the following officers: President, Henry R. Bond, Jr.; secretary, J. P. T. Armstrong, and treasurer, Alexander E. Fournier. One of the commendable objects of the organization will be to urge the building and maintenance of first class roads in and around New London.



Digitized by Google

LOS ANGELES ASSOCIATION ELECTS.

P. H. Greer was recently elected president of the Los Angeles Motor Car Dealers' Association, Los Angeles, Cal., at the annual meeting. The other officers chosen were: Vice president, E. Roger Stearns; treasurer, Bonnie Berges; secretary, Earl Y. Booth. The new board of directors includes the officers and Paul A. Renton, Leon T. Shettler and Clarence Smith. After the election a banquet, complimentary to the retiring officers, was held. The association now has 31 active members, and approximately $3500 in its treasury.

HI-PO WATER PROOF DRY CELLS.

When dry cells are installed properly they give efficient service both for ignition and open circuit work. One of the drawbacks to these members has been their susceptibility to moisture, or water, and when thus exposed their life is considerably shortened. This difficulty has been overcome by the Lincoln Electric Company, 1007 Atlantic avenue, Brooklyn, N. Y., which concern produces a cell known as the Hi-Po and which is stated to be impervious to moisture; in fact, the maker points out that the cells may be left standing in salt water without risk of a short circuit, a feature which will be regarded important in itself. This water proof quality is due to a patent process by which the cell is constructed, and each battery is built up and sealed in an insulated casing. It is also claimed that the Hi-Po is not affected by climatic changes and that it may be utilized on land, sea or air. It is made in three standard sizes, Nos. 6, 7 and 8, respectively, and the dimensions are 2.5 by six, three by seven and 3.5 by eight inches. The amperage is purposely made moderate, it being stated that longer life is assured thereby.

Hi-Po Water Proof Dry Cell.

LIBERTY RUBBER FACTORY.

Announcement is made by the Liberty Rubber Company, Orange, N. J., of the building of a new factory in that place, a step necessary by the rapidly increasing demand for Men-Do, a tire and tube repair outfit manufactured by the company, as well as other rubber specialties. The new structure will be located on Standish avenue and will be of fireproof material containing every modern convenience. The design is such that additions may be made as required. When the new plant is completed it will enable the concern to produce 100,000 Men-Do outfits annually.

The Liberty Rubber Company is incorporated under the laws of New Jersey and was reorganized recently to increase its capitalization. The management, however, remains the same, Harold T. Ray being president and general manager and Charles A. Whelan, secretary and treasurer. The selling force of the company has been augmented by the addition of four more travelling salesmen.

ON LONG TOUR IN AN OAKLAND.

Leaving Detroit recently in an Oakland car, made by the Oakland Motor Car Company, Pontiac, Mich., George B. Spangler, a motorist of well known experience as a tourist, started on a trip which will take him to San Francisco, thence to Galveston, New Orleans, Savannah, Washington, Philadelphia, New York and back to Detroit. The total distance covered will be about 15,000 miles and approximately 500 cities and towns will be visited. The touring load is 4500 pounds. Spangler has motored through large sections of Europe, and on one trip piloted a touring car through Cape Colony and the Transvaal Republic to Pretoria and return on a wager.

STUDEBAKER SEES NEW ERA.

According to Clement Studebaker, Jr., first vice president of the Studebaker Corporation, maker of the E-M-F and Flanders cars and Studebaker electrics, the automobile industry has entered upon a new era. He holds that business practises which have been in vogue must be replaced by more substantial efforts with respect to the future. What this future will be, he is unable to venture a guess, but he suggests that some idea may be gleaned from the fact that if the cars produced by his concern this year were placed end to end, they would extend from New York to Boston, a distance of 214 miles.

"The automobile business cannot be run in the future as it has been in the past," says Mr. Studebaker. "The automobile is no longer an experiment, a novelty or a toy. It is an immensely important mechanical feature of our natural life. The wild cat times are over. Mushroom growths are at an end. The rush into automobile manufacture, the craze for flash and novelty, the systems of making and selling, the reckless disregard of after service in a car, will not be tolerated, and careful manufacturers must think of the future."

Digitized by Google

MILLER SUIT WITHDRAWN.

Because of the prominence of the defendant, Chas. E. Miller, 97-103 Reade street, New York City, who has been engaged in the automobile accessory business, as manufacturer, exporter, importer and jobber for 16 years, being in fact the pioneer accessory house in America, the action of the Lovell-McConnell Manufacturing Company, Newark, N. J., against this concern, asking for a preliminary injunction restraining it from dealing in Klaxon horns, is of decided interest. Inasmuch as Miller has 15 stores in eight states throughout the country, the outcome of the suit is of far reaching effect.

Miller also handled Newtone horns, made by the Automobile Supply Manufacturing Company of Brooklyn, N. Y., and it was claimed by the Klaxon people that this device infringed theirs. The action was brought on the ground that Miller's position as representing both horns was in violation of the conditional license granted by the patentee. After it was brought, much correspondence passed between Miller and the Lovell-McConnell company, as a result of which Miller declared the Klaxon product would be handled no longer under any condition.

When the matter came before the United States district court in New York City early in the month, the motion for the injunction was withdrawn by the plaintiff. Arthur W. Weil, Miller's attorney, states that this action was voluntary, after the defendant announced it was ready to argue the motion.

CURRENT PAIGE-DETROITER.

The current issue of the Paige-Detroiter, published by the Paige Detroit Motor Car Company, Detroit, is replete with information which is timely and of interest to owners and contemplated owners of Paige-Detroit cars, made by this concern. The cover design is quite in keeping with the season, and the text matter is equally pertinent. Three articles are worthy of special mention, these being: "Glad Hand," a story by Clarence E. Goodard and Lewis A. Deffner, both of Springfield, Mass., concerning the first leg of their transcontinental trip from Boston to San Francisco; "The Advantages of Co-Operative Advertising," by James M. Dunlap, and "Coming with Culley," by O. R. Hardwell, advertising manager of the company.

REGISTRATION IN NEW JERSEY.

Despite the cry raised by opponents of automobile reciprocity in New Jersey, the registrations up to June 1 showed a large increase over last year. The total number of machines registered up to this date was 39,790 as against 25,878 for the corresponding period in 1911, when reciprocity was not in force. The opponents to the new legislation asserted that foreign car owners would not take out yearly car licenses, but would depend entirely on the 10 days' touring privilege. This has not proved to be the case, for in the registration to date there has been a higher number of foreign machines listed than during the whole of last year. The registration shows heavier cars and more extremely light ones among the new machines, indicating that the two extreme styles in up-to-date car building are well patronized.

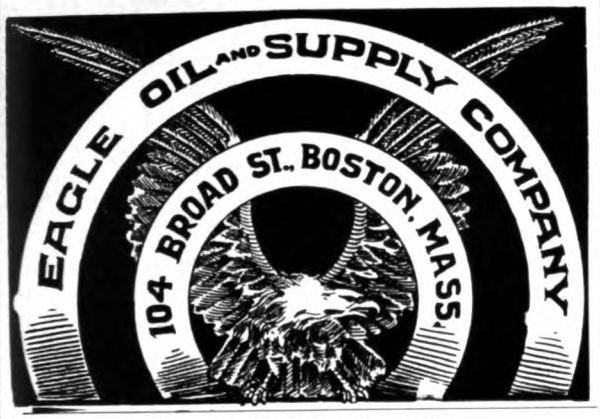
UNITED STATES MOTOR COMPANY.

A meeting of the directors of the United States Motor Company, New York City, selling organization for the Columbia, Maxwell, Stoddard-Dayton, Brush and Courier pleasure cars and Sampson trucks, has been called for the purpose of taking action on a proposition to issue $4,000,000 of five-year serial bonds, convertible into common stock at par and bearing six per cent. interest. These debentures would be a portion of the $6,500,000 still in the company's treasury out of the $12,500,000 authorized a year ago.

It is understood that the company is in need of working capital since it is necessary to finance the coming season's output before completely disposing of the 1912 product. An official of the company is authority for the statement that the concern is in better condition than at any other time in its history, insofar as the relative values of the assets and liabilities are to be considered. With the question of working capital settled, there seems reason for believing that the present difficulty will be entirely overcome.

HILLS IS SUPERINTENDENT.

Clarence A. Hills, son of Mr. and Mrs. F. O. Hills of Prescott street, Torrington, Conn., has been made superintendent of the Abbott Motor Company's works at Detroit, Mich. For the past two years he has been connected with the Hupp Motor Car Company of Detroit, maker of the Hupmobile, in the same capacity. At the close of his engagement a short time ago the employees of the firm gave him a gold watch and the officers of the company presented him with a diamond stick pin.



As a boy, Mr. Hills took his first lessons in mechanical drawing in the Y. M. C. A. classes at Torrington. Later he went to a technical school in Kingston, R. I., and then took a position with a manufacturing concern in Bantam, Conn. As soon as he had earned sufficient money he went to Ann Arbor, Mich., where he completed a course in mechanical engineering and at once accepted a position with the Olds Motor Works in Detroit as draftsman. When this plant was removed from Detroit to Lansing, he secured a position with the Chalmers Motor Company, leaving the latter concern to go with the maker of the Hupmobile.

J. O. Moore, New England manager for the Warner Instrument Company, Beloit, Wis., maker of the Warner Auto-Meter, addressed the Boston Y. M. C. A. automobile school June 14. During the lecture the small parts of the instrument were exhibited.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

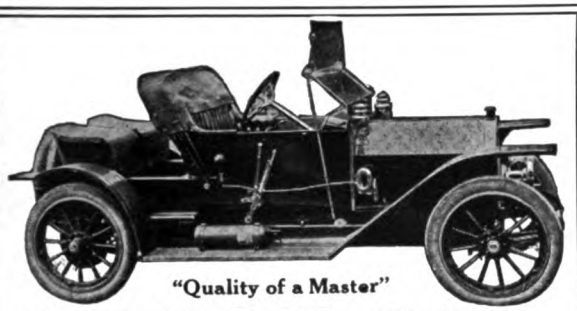
"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times. When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"



The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them. Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

NEWTONE

The Mile Away Electric
MOTOR HORN

Torpedo Type

PRICE

$20.00

Including Button and Cable

Patented Sept. 5, 1911

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

Weed Anti-Skid Chains

One of the Most Remarkable Inventions in the History of the Motor Car Industry

A well known editor of one of the largest automobile papers thus expresses his views: "The fact remains that no other device will do just what *Weed Chains* will do. The Weed invention is one of the most remarkable in the history of the Motor Car industry. When first put upon the market, its *effectiveness* was self evident, but the skeptic said it would ruin tires and that something far better would be forthcoming. The fact is that it *constantly creeps and does not ruin tires* any more than the ordinary use of the tire—without the chains—wears it.

"*Another fact* is that Taxicab companies, who do everything that money can do to minimize accidents, universally use *Weed Chains* because *no other device at any price is equally effective.*"

When Used on the Front Wheels, Too

Weed Chains give comfortable, easy steering; no cramped fingers; no cramped arms; no sore muscles—out of car tracks, ruts, and "heavy going"—*just like steering on smooth roads.*

Even if you don't value your own life—what right have you to imperil the lives of others? *For your own safety*, for the safety of the public and other road users, fully equip you car with *Weed Chains* today.

Recommended and sold by all reputable dealers.

GASOLENE GALLON GAUGE

For Automobiles and Motor Boats.

For measuring the amount of gasolene in supply tanks.

The numbered markers are slideable and may be adjusted to show the number of gallons in any given tank whether it is square, round, oval or irregular in shape.

The depth of each gallon is the same in square sided tanks.

In round or oval tanks the depth of the gallons will be less towards the middle of the tank.

The outside level marker shown is to register the amount in the tank at any given time.

Handsomely finished in black stained wood, 15 inches long, with 20 brass markers.

If your tank holds more than 20 gallons, extra markers will be inserted as ordered.

Price 50 cents postpaid anywhere in the United States.

Send Express or Postoffice money order. Stamps accepted.

SPECIAL.

Extra long gauges made to order for very deep tanks; not more than 24 inches in length, with markers numbered from 1 to 30 as may be required.

Price 75 cents, postpaid anywhere in the United States.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

A plain talk on Carbon Deposit.

THERE are three mistaken ideas on carbon deposit.

(1) Light colored oil is commonly supposed to leave the least carbon deposit. (2) Heavy-bodied oils are often avoided through fear of excessive carbon deposit. (3) Claims that some lubricating oils are "non-carbon" are often accepted as sound.

Our experience has clearly shown that:

(1) Color is an unsafe guide in determining the amount of carbon in an oil.

(2) The body of the oil does not determine the amount of carbon deposit. The heaviest oil that can be properly used gives the most efficient automobile lubrication.

(3) "Non-carbon" oils do not exist. Lubricating oils are a hydro-carbon product. Were all carbon eliminated, *the oil could not lubricate.* The *free* carbon is the only carbon that can be safely removed.

The amount of carbon deposited in the cylinders depends partly on the carburetion and gasoline combustion, partly on the oil, partly on its fitness for the car.

Unfortunately, the more the layman tries to comprehend carbon deposit, the more he is bewildered. He needs authoritative guidance.

Equipped with the experience gained from our authoritative position in lubrication, we studied every make of American automobile and many foreign makes.

We found that no one grade of lubricating oil would suit all cars. We produced our Gargoyle Mobiloils in several grades, and prepared a schedule showing the correct grade for each make of car.

The complete schedule will be mailed you on request.

We refined and filtered these oils to remove free carbon. Aside from furnishing the correct oil for each car, that is the most that any producer can do toward eliminating carbon deposit.

We can say without fear of successful contradiction, that these oils establish a world standard for automobile lubrication.

Gargoyle Mobiloils are put up in barrels, half-barrels, in 5 and 1 gallon sealed white cans.

All are branded with the Gargoyle, which is our mark of manufacture. They are handled by the higher class garages, auto-supply stores and others who supply lubricants.

Mobiloil

A grade for each type of motor.

If oil saves power, it follows that one oil saves more power than another.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

THE BEAUTY OF THE 1913 PEERLESS

It is individual, distinctive; it is apparent at a glance; it grows with familiarity; it lingers with you like the beauty of a living being; there is something personal in it.

This beauty—inevitably associated with a Peerless car—is no thing of chance. It is the beauty of studied harmony—for every part and piece is perfectly proportioned to every other.

It is the beauty of long, clean lines and graceful curves—in the sweep of the fenders, in the unbroken line of the parapet, in the gradual taper of the bonnet, in the broad, continuous curve of top and body-back.

It is the beauty of simplicity—the extra tires are carried below the parapet, the chairs in the tonneau fold away out of sight, there is no break or jarring contrast to the long lines and the broad expanse of body-surface.

It is, too, the beauty of utility and strength—of power in reserve. The three six-cylinder chassis, equipped with various types of open and closed bodies, meet the requirements of experienced motorists. All have the flexibility of a motor unusually long of stroke, with the convenience of an automatic dynamo electric-lighting system and a power-driven tire-pump.

One can not view this car as it flashes over the road, the sunlight glancing from wheels or polished body-surface, without a deep and lasting impression of beauty.

Its beauty and comfort can be yours for the full season, as the 1913 Peerless is ready for immediate delivery.

THE PEERLESS MOTOR CAR COMPANY
CLEVELAND

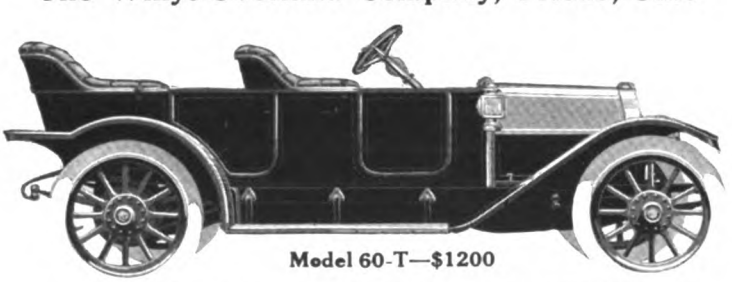
Overland

WE want every prospective purchaser of an automobile to know that the Overland Model 60 costs $1200.



To sell you a model 60 we want you to know the price first. We do not base our arguments on worthless special selling points in the manner of some manufacturers. Others will tell you of a thousand special features first of all. You may even have to ask the price.

You can get more automobile satisfaction for $1200 in an Overland Model 60 than for $1500 in any other line. That is why, when you come to inspect this car, we tell you the price first. Its merit is then self-evident.

The Overland Model 60 will never be equaled in low price until there is a duplication of the mammoth Willys-Overland production methods.

Ask for book K-47.

The Willys-Overland Company, Toledo, Ohio

Model 60-T—$1200

Wheel base, 111 inches; body, 5-passenger fore-door touring; motor, 4⅛ x 4½; horsepower, 35; Remy magneto; tires, 34 x 4 inch Q. D.; equipment, three oil lamps in black and brass finish, two gas lamps, horn and generator. Self-Starter, $20 extra.

True Merit and Real Value
Now Recognized

The only Anti-Skid device which can be relied upon and the only one in which absolute confidence can be placed.

Proven to be a necessity and not a luxury.

Weed Chains
"With the Creeping Grip"

No car is safe without them. They have stood the test of time and are regarded as the *most important* and profitable accessory handled and sold by automobile dealers. *Victory after victory* has perched on the banner of Weed Chains.

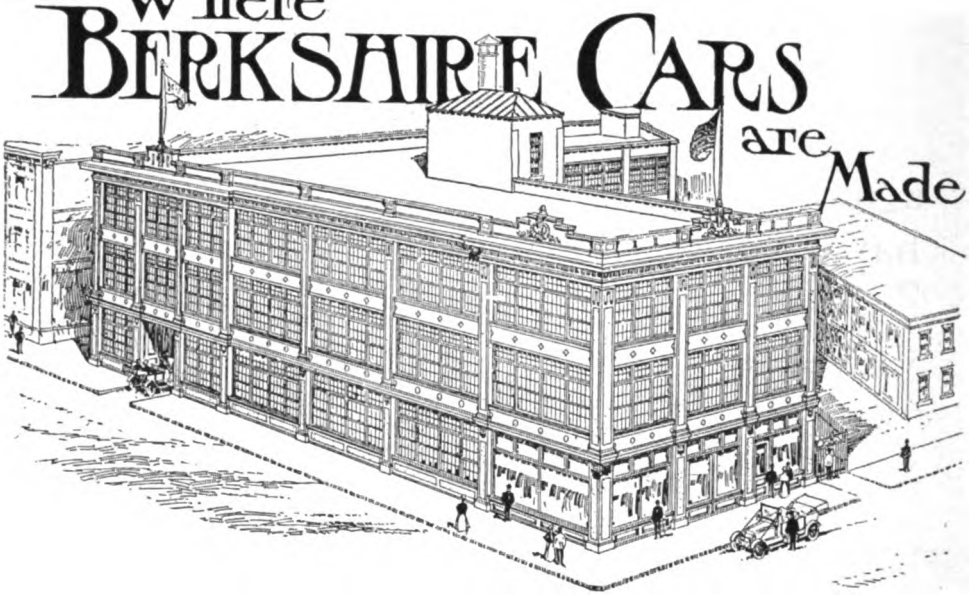
The courts, in emphatic language, after carefully considering the facts, have in numerous cases issued injunctions, *restraining infringers* from manufacturing or selling their infringing devices. Weed Chains are *the only genuine* Anti-Skid device—all others are infringements.

Join today the army of "Anti-Skidders"

Consider your own safety—consider the safety of the road users. Take no chances.

Wise motorists are victorious in overcoming skidding accidents by the use of Weed Chains.

Cannot injure tires because they creep. *Absolutely necessary* on wet and greasy pavements, or on muddy, slippery roads. By our *new, secret process of hardening*, just adopted, the cross sections are more perfect and wear better than ever before. Packed and shipped in canvas bags.



Equip your own car with *Weed Chains* and insist, for your own protection, that other drivers do the same.

Recommended and sold by all reputable dealers.

Weed Chain Tire Grip Co.

This truck saved $1546.12 the first year

KisselKar 3 Ton Truck

Saved $1546.12 First Year

The purchase price of this four-ton truck, owned and operated by the Howard Company of New Haven, Conn., plus interest, depreciation, overhauling, fuel and driver's salary for one year, amounted to $5,921.88.

It replaced three double trucking teams. The cost of the horses, wagons and harnesses, plus interest, maintenance and drivers' salaries for one year amounted to $7,468.00. A balance in favor of the truck of $1.546.12—the first year.

A Kissel truck is your logical selection because it is the truck of surest economy and slowest depreciation. It is strong, simple and silent. It carries 50% overload without harm. It rides easiest. It consumes the least fuel.

Note these striking KisselKar merits: its wonderful engine—its lock on the differential which equalizes power between rear wheels, when without it, a slipping wheel would absorb all the power—its fourth geared up speed which saves the engine when driving empty and makes fast time judicious when haste is necessary.

At the disposal of KisselKar owners is the unrivaled KisselKar service, consisting of completely equipped service buildings at leading centers, where the mechanical end of motor trucks is taken off your hands.

KISSELKAR TRUCKS

Write and tell us how many horses you use, how many trips they make per day, single or in teams, the average number of stops per load, carrying capacity of your equipment, average daily distance covered, cost of drivers and aids, general nature of the highways traveled.

Do this and we will tell you how motor haulage may be most advantageously used in your business.

Your copy of the new catalog is ready. Send for it.

Long-Stroke "32" Touring Car, $900

F. O. B. Detroit, including equipment of windshield, gas lamps and generator, oil lamps, tools and horn. Three speeds forward and reverse; center control; sliding gears. Four cylinder motor, 3 1-4 in. bore and 5 1-2 in. stroke. Bosch magneto. 106-in. wheelbase, 32 x 3 1-2 in. tires. Color, Standard Hupmobile blue. Roadster, $900.

Standard 20 H. P. Runabout, $750

F. O. B. Detroit, with same power plant that took the world-touring car around the world—4 cylinders, 20 H. P., sliding gears, Bosch magneto. Equipped with top, windshield, gas lamps, and generator, oil lamps, tools and horn. Roadster, 110-inch wheelbase, $850.

How the Long-Stroke "32" Pulls on the Road

Hupmobile

Power in plenty to take the car and its load through sand and mud and up the hills is one of the most valued characteristics of the Long-Stroke "32" Touring Car.

How the steady, bull-dog pull of the long-stroke motor works to the tourist's advantage is convincingly told in the experience we cite here.

Late last March, when the country roads were at their worst, Earl Sowards drove a recently-bought Hupmobile "32" touring car, fresh from the Detroit factory, to his home in Decatur, Ind.

"It is the best mud-turtle you ever saw. I could not tell you how bad the roads were, for if I did you would not believe me," he wrote after completing the trip.

"I had 23 miles where I never saw a place that the mud was less than six inches deep; and one place the mud came above the running board for a space of 40 rods or more. It is impossible to stick the car.

"The Model '32' is the best car on earth to pull in the mud. I know for I have driven several of the best makes. I have had eight years of experience.

"I was pulling through the mud along by a farmer's house. Just in front of the house I thought I would have some fun; so I let my motor die slowly and stopped for a chat. I asked the farmer if he would get his team and pull me out. He answered: 'There are no two teams in the country that could do it.'

"Then I told him that I would have to pull myself, and he said: 'I guess you can stay with me until the mud dries up a little.'

"When I was ready to go on, I started as if nothing had happened.

"He said he was going to have a car of that kind."

All country roads are not boulevards; and many a tourist finds himself in difficulty when the bad stretches are reached.

On the other hand, the Hupmobile owner tackles any road, serenely sure that his power will take him through.

Added to this, are a low center of gravity, lines and style not approximated in any other car of Hupmobile price, and mechanical features that you should certainly know about.

Driving A Car At Night

The Necessity For Installing
The Best Lighting Equipment

Safety, convenience and comfort depend on the quality of the lighting equipment of every car. After sundown, some roads—especially strange highways—offer many opportunities for trouble. Ruts, holes, dangerous curves and crossings constantly present themselves. With powerful, brilliant light the motorist need not fear any road. A broad bright ribbon of light makes every highway safe.

The best system
to use is
the reliable and efficient

GRAY & DAVIS
Lighting Dynamo

Gives the most brilliant light. Operated by the motor and requires but 1-6 H. P. Charges batteries, furnishes current for all auxiliary purposes and enables you to light your lamps without battery connection. Has the necessary CONSTANT SPEED feature. You need no other system.

Studebaker

Flanders "20"

Forget the nameplate—and still the car stands pre-eminent

If it bore no nameplate—the Studebaker Flanders "20" would be bound to make an immediate and an impressive appeal to your preference.

If it had no reputation—your sense of value would instantly recognize the wonderful money-worth of the car.

If it had enjoyed no sales-success—a demonstration of its splendid response to every normal, or even abnormal demand would drive you straight to the decision that your $800 could not be better expended.

Study it from any of the ordinarily accepted specification standards — motor-measurement, power, wheel-base, axle-strength, ease, style—and rivalry, in its class, recedes into the remote background.

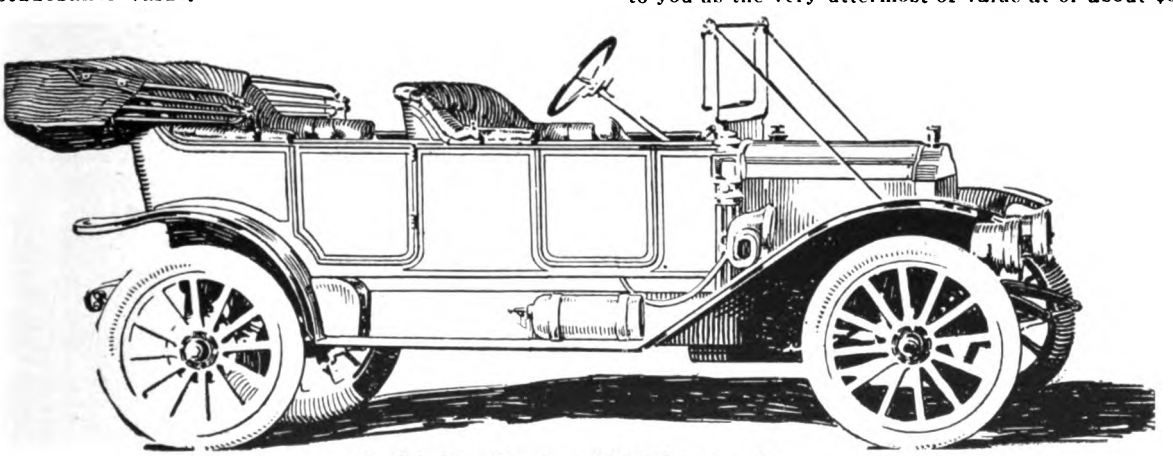
But you are not asked to draw a check for $800 on the evidence of your own eyes; or your own experience; or your own sense of value.

The Studebaker "20" will speak for itself on that close-range inspection which should precede a purchase—but another voice speaks to you in its behalf, louder and more impressive still.

Seventy-five thousand of your fellow citizens vouch for Studebaker value.

And we would like you to feel the impact of that tremendous pressure of public opinion.

We would like you to summon up a mental picture of that mighty host of Studebaker cars rendering yeoman service in every nook and corner of the nation.



We would like you to remember that the satisfaction of these 75,000 citizens has its *source* in the name Studebaker.

We would like you to realize that each and every one of these 75,000 cars does its full duty, day by day, precisely *because* it is a Studebaker car.

The Studebaker "20" which you buy and drive is the embodyment and the expression of the sixty-year-old Studebaker policy of serving its public.

We want you to remind yourself that the Studebaker word has been good as gold to the buying world for more than a century—and that it is being made good in every car that issues from the mighty Studebaker plants.

The globe-girdling sales system of the Studebaker Corporation—the 1,800 Studebaker stores in America—the superb laboratory and manufacturing equipment in the Studebaker plant—and the low cost of production and distribution which they involve—in these factors you find the reason why the Studebaker "20" lays immediate hold upon your preference—why it appeals to you as the very uttermost of value at or about $800.

Studebaker Flanders "20" Touring Car.

$800 F. O. B. Detroit, standard equipment.
Equipped, as above, with Top, Windshield, Prest-O-Lite Tank and Speedometer, $885.

SHOCK ABSORBER

ALMOST UNIVERSALLY USED IN FRANCE

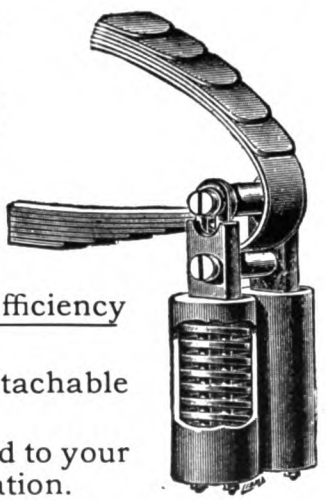
THE RAGE IN ENGLAND

TRADE MARK

"Look at the rear springs"

if you want to know why some cars ride so comfortably—why comfort is possible when only one or two persons ride in a 7-passenger car.

It's because they are equipped with



"J. M." Shock Absorbers

which not only *absorb* all jolts and jars, but *actually prevent* them.

By keeping the rear wheels on the ground, the "J. M." secures continuous traction, and eliminates:

First—Racing of the engine when the car jumps the ground;

Second—Grinding of the tires when they hit on the rebound.

This means maximum comfort, increased engine efficiency and decreased tire expense.

Made in three models---attachable in an hour, detachable in fifteen minutes.

Prices, $35 to $50 per set. Send coupon below pinned to your business letterhead for booklet D, with full information.

BOSCH

A Product of True Merit

On Tour

Perfect ignition is essential for complete enjoyment of your trip: it is then that you appreciate the thorough reliability and perfection of

BOSCH
Magnetos and Plugs

The numerous displays of unequalled efficiency whether on Track, Speedway or Hill, likewise the continual high percentage of drivers to use Bosch products in the events where forced conditions prevail, afford an idea as to the confidence those on tour may place in the Bosch Magneto and Plugs.

Most tourists use Bosch equipment; they insure themselves safe and timely arrival without attention or worry. They are sure that Bosch Magnetos and Plugs

Are Best

Ask your dealer or write us concerning any information you may desire.

Directory of Touring Information

KEY TO ROUTE INDEX.

Suppose that a motorist in Boston, Mass., desires to visit Milwaukee, Wis., to witness the Vanderbilt Cup race. Study of the map on pages 40-41 will indicate that he must pass through Chicago. Follow the directions under the heading **BOSTON, MASS., TO—Chicago, Ill.** to Chicago. Next turn to **CHICAGO, ILL., TO—Milwaukee, Wis.**, and full directions will be found for reaching the latter city.

Assume that a Milwaukee motorist desires to visit the Pacific Coast. He knows that he must pass through Chicago, and in order to reach that city, he will reverse the routing supplied in **CHICAGO, ILL., TO—Milwaukee, Wis.** Study of the double-page map will reveal that Chicago is on the Transcontinental Tour, which has been designated A. This will give him complete running directions to San Francisco, from which point he may select any itinerary offered.

Should a tourist who has reached Los Angeles, for instance, over Transcontinental Tour A and Pacific Coast South, desire to return to the East by another route than that suggested in Transcontinental Tour B, he may connect with the outward bound route at Denver, Col., by following Transcontinental Tour B to Phoenix, Ariz., and the routing indicated in **PHOENIX, ARIZ., TO—Denver, Col.** Reaching Denver, he has the option of returning to Chicago by reversing Transcontinental Tour A, or by following the routing outlined in **DENVER, COL., TO—Kansas City, Mo.**, thence by way of **KANSAS CITY, MO., TO—St. Louis, Mo.**, and **ST. LOUIS, MO., TO—Boston, Mass.**, etc.

It is believed that by the use of this Directory of Touring Information, combined with the itineraries elsewhere in this issue, a motorist may start from any point in the United States and reach any other point without difficulty.

Cartercar

This is one of the five splendid Cartercar models—has five passenger capacity—at $1600. Its unusually attractive appearance, combined with the remarkable efficiency and reliability of the Cartercar have made it one of the most popular sellers this season.

There are no unnecessary parts to the Cartercar. It has no gears--no universal joints--no clutch. All these weak features of the ordinary car are replaced by the patented Friction Transmission, the strongest point about the Cartercar.

This transmission enables the Cartercar to climb 50% grades --and to go through roads where other cars are helpless. It affords an unlimited number of speeds--all controlled with one lever. With only two unit parts, this transmission simply cannot cause trouble. The Cartercar is built for service the year around--and over all roads.

Write today for full information and special booklet.

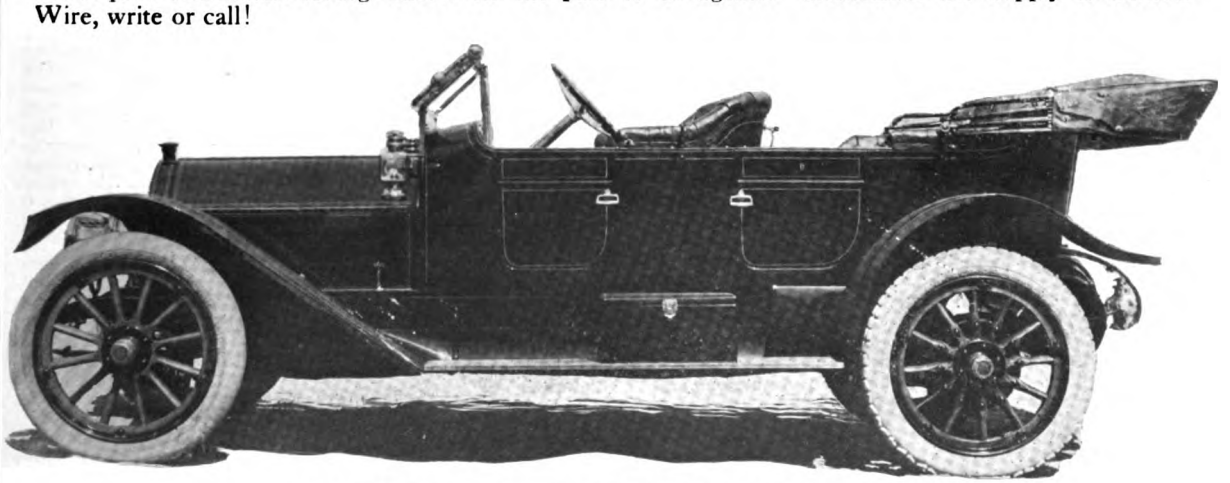
ANNOUNCEMENT 1913

PALMER-SINGER "BRIGHTON-6"

$2000.00

Agents Wanted

SEAL OF GUARANTEED SERVICE — PALMER ~ SINGER



Write for Proposition

The strongest built car in the world.

THE PALMER-SINGER "BRIGHTON SIX" is speedy, silent and sturdy. We are offering the public all the advantages resulting from six years of experience in the manufacture of six-cylinder cars. The PALMER-SINGER "BRIGHTON SIX" is manufactured in a six-cylinder factory.
The "BRIGHTON SIX" will be the same leader for a second season that it was when it made its initial appearance among higher priced cars.
We have not fallen into the error of trying to build "sixes" on the lines of a four. We absolutely will not build more than 1,000 of our "BRIGHTON SIX" models for 1913, and agents who desire to carry a high-class six will do well to communicate with us at once. The PALMER-SINGER "BRIGHTON SIX" is one that does not require Herculean selling efforts on the part of its agents. Remember the supply is limited. Wire, write or call!

SPECIFICATIONS.

Wheel base 127 inches.
H. P. 45.
Rims, demountable.
Rear axle, floating.
Clutch, multiple disc in oil.
Imported magneto—double ignition.
Luxurious upholstery.
Motor, T-head type with cylinders cast in triplets.
Price $2000.

Meets All Demands That Any Motor Can Put Upon It

TEXACO MOTOR OIL

Heavy Fire Truck

Heavy Pleasure Car

Light Pleasure Car

Greater Mileage, Less Consumption, No Carbon —Proven by Test

Texaco Motor Oil has been put to many severe and interesting tests. The results are important to every car owner. They are proofs of quality—of service rendered.

A brief summary of three of these tests tells the story. They include use in a very heavy truck, in a heavy pleasure car and in a light pleasure car. Note the increase in power, decrease in consumption, absence of carbon, and cleanness of spark plugs.

Tests in Hook and Ladder Fire Truck at Factory

Three oils used in this test. Competitors' oils indicated by letters "A" and "B." Conditions under which oils were tested were the same except that at the beginning of third test, that of Texaco Motor Oil, motor was badly overheated due to the two tests that had preceded. Motor cooled during the test of Texaco Motor Oil. About ten minutes intervened between first and second and second and third tests. For the purpose of the test a long, very steep hill was used. Truck was sent at it from a standing start.

	"A"	"B"	Texaco
Oil used			
Distance run	¾ way up hill. Motor stalled. Truck backed down under brakes.	½ way up hill. Motor stalled. Truck backed down under brakes.	To top of hill. Truck turned and descended with motor running.
Condition of motor beginning of test	Perfect	Overheated	Badly Overheated.
Condition of motor end of test	Overheated	Badly Overheated	*Good*
Saving in Oil consumption	None	None	25%

Tests in "Cadillac" and "Winton Six"

	In "Cadillac"	In "Winton"
Oil used	Texaco	Texaco
Duration of use	*Two years*	One year
Distance traveled, miles	5,000	20,000
Condition of motor, beginning	Perfect	Perfect
Condition of motor, end	*Perfect*	*Perfect*
Repairs of motor	*None*	*None*
Carbon deposit	*None*	*None*
Cleaning of spark plugs	*None*	*None*

Texaco Motor Oil is sold in one and five gallon cans at most garages and supply shops. Look for the can with the inner seal and long, detachable spout. Colors—green with red star.

We have prepared a booklet, "About Motor Lubrication." We want every owner of a motor car to read it. Your copy is waiting for you. Address Dept. E. 7 West St., N. Y. City.

More Jewelers Than Blacksmiths Work on the Warner Auto-Meter

For the Warner is a *jeweled* instrument. It is the product of *jewelers* and experienced instrument makers.

It is built with more care than many watches.

For it must *do* more than any watch ever built.

It must possess Waltham *exactness*, Elgin *sensitiveness*, Howard *dependability* yet be able to endure the persistent cruelty of severe vibration at all times, in all weather, in frigid or torrid temperature. It must possess, above all, Warner *endurance*.

Some watches are sold at retail for four dollars. There is a certain market for these watches.

But there is a *greater* market for *high quality* watches since the advent of the cheaper tickers.

The *high* quality watches win by *contrast*, by *comparison*.

More quality Warners have been sold this year because 1912 is a *quality* year.

By comparison and contrast the Warner is chosen by far-sighted car manufacturers, dealers and owners.

Model K-2

Price Complete

$75

Diameter 4 1-2 inches. Season odometer registers 100,000 miles and repeat. Trip odometer, 1,000 miles and repeat. Indicates all speeds up to 60 miles an hour. Finished in brass, nickel or black enamel with brass or nickel bezel. Hooded electric light connection under the glass concentrates rays of light on speed and distance figures.

Automobile Manufacturers

are *glad* to *pay* for quality because the Warner, as part of their car's equipment, helps to give the car class and distinction—allows the owner to drive the car *intelligently*—to *know* what the car is *doing*—to put the x-ray on the car's service *every minute*.

Such a manufacturer *must* be far-sighted to do this. He *must* be figuring on the owner's *lasting* satisfaction.

For the Warner is built to *last*. It is about as hard to figure the duration of Warner service as to know the exact life of the high-grade watch. We *do* know that the instruments we made in the very earliest days of manufacture are still giving the same accurate service. Many of these have registered over 100,000 miles and have been used on five and six different cars.

Warner Instrument Co.,

Main Offices and Factory: 1287 Wheeler Avenue,

Tarvia

Preserves Roads
Prevents Dust~

Boulevard--East Side Mississippi River--Minneapolis, Minn. Road treated with Tarvia A.

Tarvia "makes good" in Minneapolis

MINNEAPOLIS has been using Tarvia since 1907—and is using it still. On November 24, 1911, Mr. Theodore Wirth, Superintendent of the Board of Park Commissioners, Minneapolis wrote—

"The Tarvia applied on Minnehaha Avenue in October, 1907, *gave very satisfactory results.* The application was made under the most ideal conditions, the new road-bed being just right to receive the binder and the screenings used for covering being of excellent quality. The surface withstood the traffic well and although the treatment has not been repeated, the road-bed is *still in fairly good condition.*

The 46th St. section of King's Highway was similarly treated in September, 1908, but in place of using stone screenings for covering, we used a fine pea gravel, which gave a pleasing color and a still better wearing surface.

The last piece of tarviating we did was on the new River Road, East from Franklin Avenue, South to the City limits, where we also used pea gravel for dressing over Tarvia coating, with the same excellent results.

This road was finished in June, 1910, and has been in constant use ever since by an immense amount of automobile traffic. I hope to be able to treat this road again with Tarvia next Spring. I am *well pleased* with the results of Tarvia on our roads."

There are three kinds of Tarvia—Tarvia X for road and pavement construction, Tarvia A for surface work and Tarvia B for dust suppression and road preservation.

Booklet describing these treatments free on request

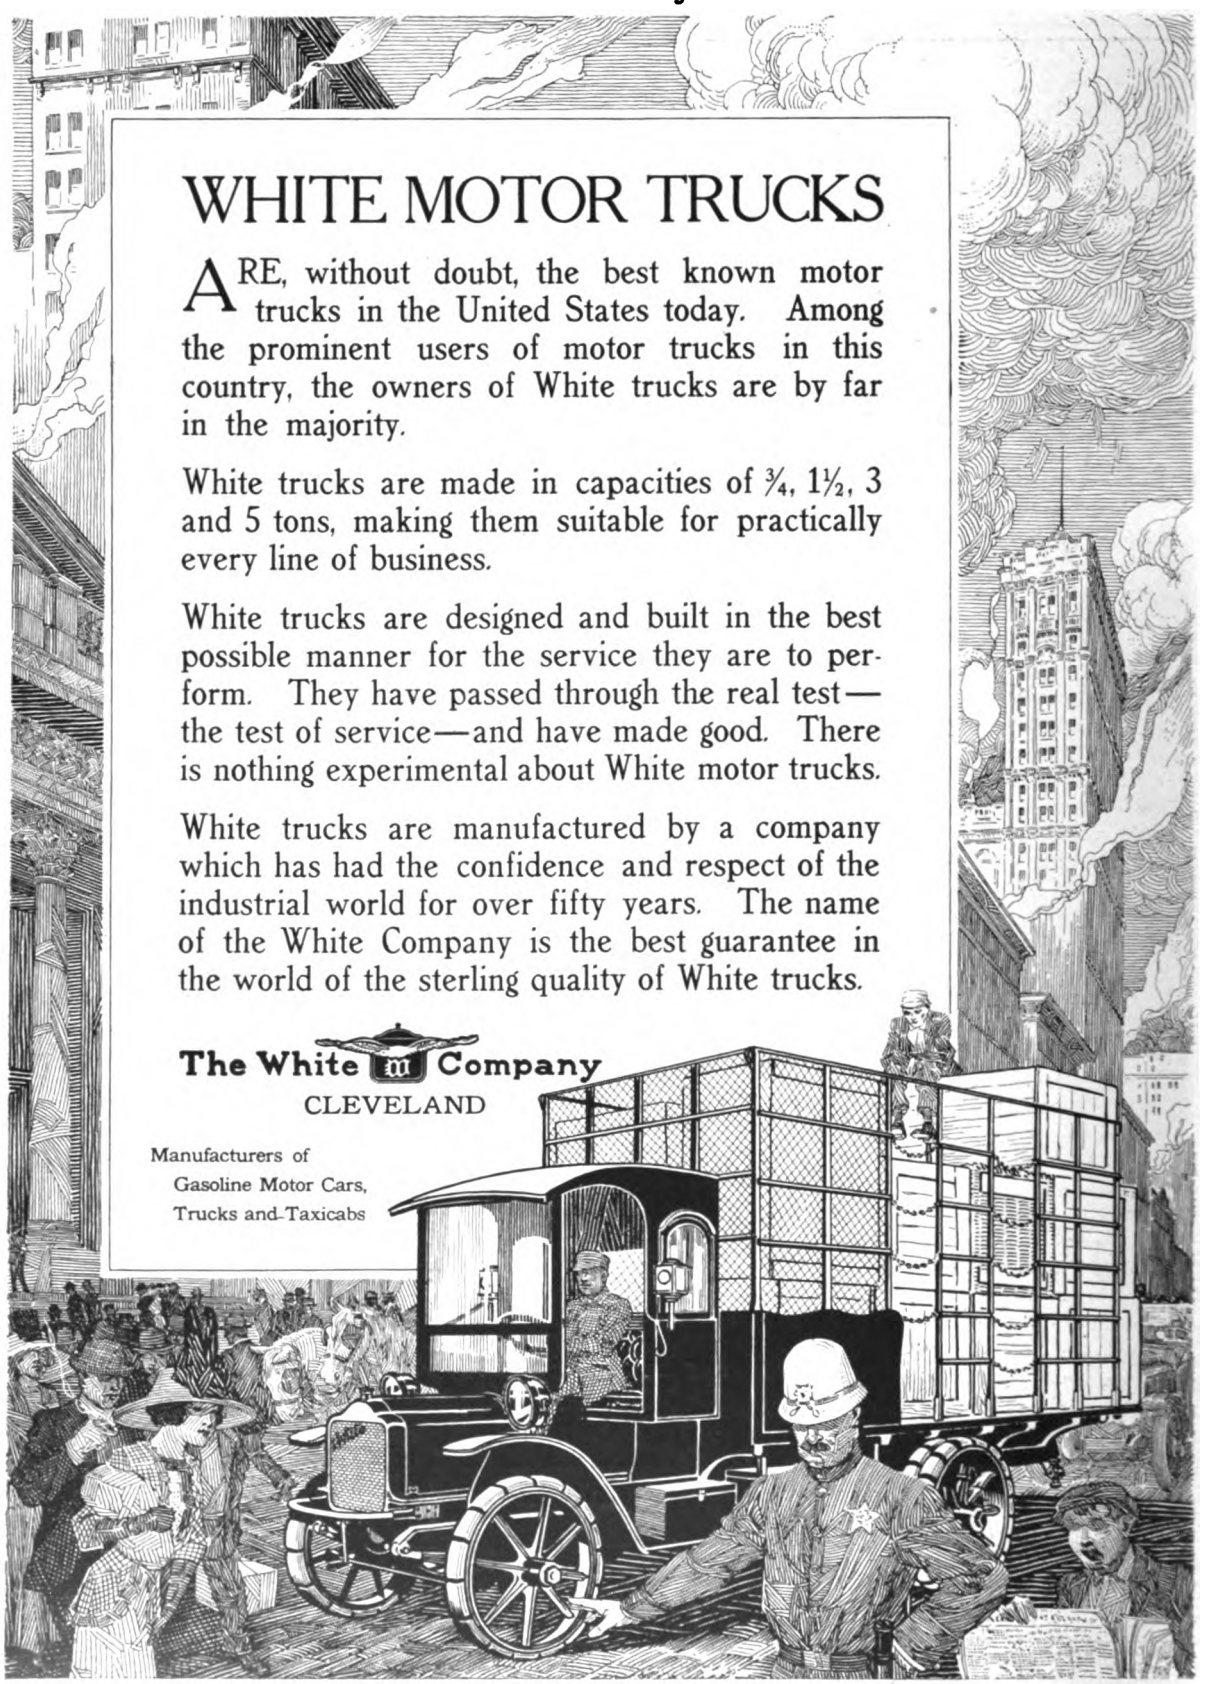
WHITE MOTOR TRUCKS

ARE, without doubt, the best known motor trucks in the United States today. Among the prominent users of motor trucks in this country, the owners of White trucks are by far in the majority.



White trucks are made in capacities of ¾, 1½, 3 and 5 tons, making them suitable for practically every line of business.

White trucks are designed and built in the best possible manner for the service they are to perform. They have passed through the real test—the test of service—and have made good. There is nothing experimental about White motor trucks.

White trucks are manufactured by a company which has had the confidence and respect of the industrial world for over fifty years. The name of the White Company is the best guarantee in the world of the sterling quality of White trucks.

THE SIXTH ANNUAL TOURING NUMBER.

FOLLOWING a plan which has met with decided approval on the part of thousands of motoring tourists, The Automobile Journal presents its Sixth Annual Touring Number. There is little need of enlarging upon the benefits accruing from spending the vacation in the motor car, or upon the value of this compendium of touring information. Each of the five numbers which have preceded it has been retained throughout the season as an authoritative compilation—a book of reference to be carried in the car continuously.

America is still a land of magnificent distances, but the automobile has demonstrated that distance is no longer a deterrent to the thorough enjoyment of what nature has provided. In view of the growing interest in transcontinental touring, it has been thought advisable to extend the scope of this year's Annual Touring Number to include the entire country. The splendid vacation grounds of New England and the East have not been neglected, however. In this respect, the information will be found to be even more complete than in previous years.

While the tendency to "See America First" is more marked than ever before, it is recognized that many Americans still delight in visiting Continental Europe. The information contained herein will place at the disposal of these every facility for making the trip a pleasure. The same thing holds true of those tours which enter the Dominion of Canada.

The digest of motoring laws in the United States, the preparation of the car and its equipment, the suggestions as to accessories and fittings that increase the enjoyment of touring, the hints as to wearing apparel—each has its place in a comprehensive number of this nature, and each will be appreciated by the thoughtful tourist. Nothing has been omitted. In every respect this Sixth Annual Touring Number is the most complete publication of its kind that ever has been placed before the motoring public.

Regarding the American section, it may be stated that each itinerary has been prepared with a view to connecting with every other tour, so that the motorist may start from any section of the country and visit any other section. In the preceding pages will be found an index to this information, the idea being simply to offer a few suggestions as to the possibilities of the itineraries which follow. Inasmuch as it would be impractical to index every combination, this list is suggestive merely. However, by a careful study of the general plan the tourist should have no difficulty in arranging his vacation to suit his fancy in every respect.

It ought to be said, that the various tours presented have been laid out primarily to suit the busy man, who may have opportunity to get away from work for a few days, but hesitates through lack of information as to where to go and how best to employ his time. The routes are not necessarily the shortest between the given points, but have been selected as offering a wide diversity of interesting scenery or for some similar reason. While some the itineraries have been published previously, all have been thoroughly revised and present the very latest information of the territory covered.

A feature of this number is the very handsome photographs illustrating the text matter, and The Automobile Journal is indebted to a large number of parties for courtesies in this regard, as well as for information concerning road conditions and other detail. Among those who have rendered valuable assistance may be mentioned: Boston & Maine, Bangor & Aroostook, Pennsylvania, Philadelphia & Reading, New York, Ontario & Western, Delaware, Lackawanna & Western, New York Central, Lehigh Valley, Grand Trunk and Great Northern railroads, the boards of trade in practically all the cities of the West and Pacific Coast, Raymond & Whitcomb Company, and a large number of individuals some of whom are mentioned by name elsewhere in this issue.

Macadam Way Invites the Motoring Tourist to Explore the Wonders of the Garden of the Gods.

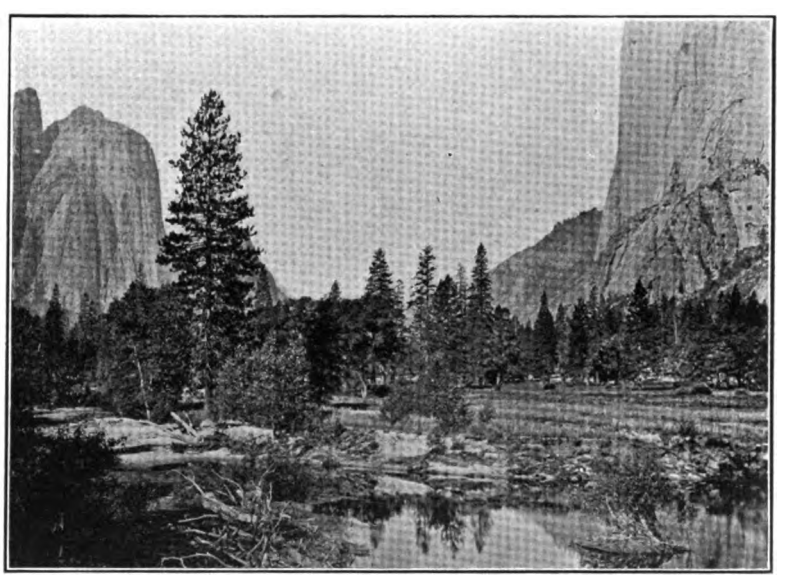
PRACTICAL TRANSCONTINENTAL ITINERARIES.



Suggestion for a Motoring Trip from New York City to San Francisco, Los Angeles and Return, with Pacific Coast Routes Connecting with Seattle.

OBVIOUSLY, it would be impossible to present in the space which must necessarily be allotted to the subject in a work of this character, complete and detailed information concerning any given route across the Continent. That there is much to be seen is indicated in a faint manner by some of the illustrations accompanying these itineraries. It is assumed, however, that the motorist who decides upon a transcontinental tour is fully aware of the natural wonders which await his pleasure in the great West and Northwest. What he is particularly desirous of obtaining in a touring number is information as to how to reach the section in which these phenomena abound. That is what The Automobile Journal has attempted to present in these columns.

Transcontinental Tour A contemplates that the tourist will leave New York City, going to San Francisco, over what has come to be known as the northern route. As outlined, it is expected that at least 23 days will be needed. It should be remembered, however, that the road conditions throughout the Rocky mountain district can hardly be termed ideal, and it is more than probable that some of the daily mileages will be found excessive, particularly for those who are accustomed to driving over the excellent highways of the East or of the Pacific Coast. In addition, it is expected that numerous stop-overs will be decided upon en route.

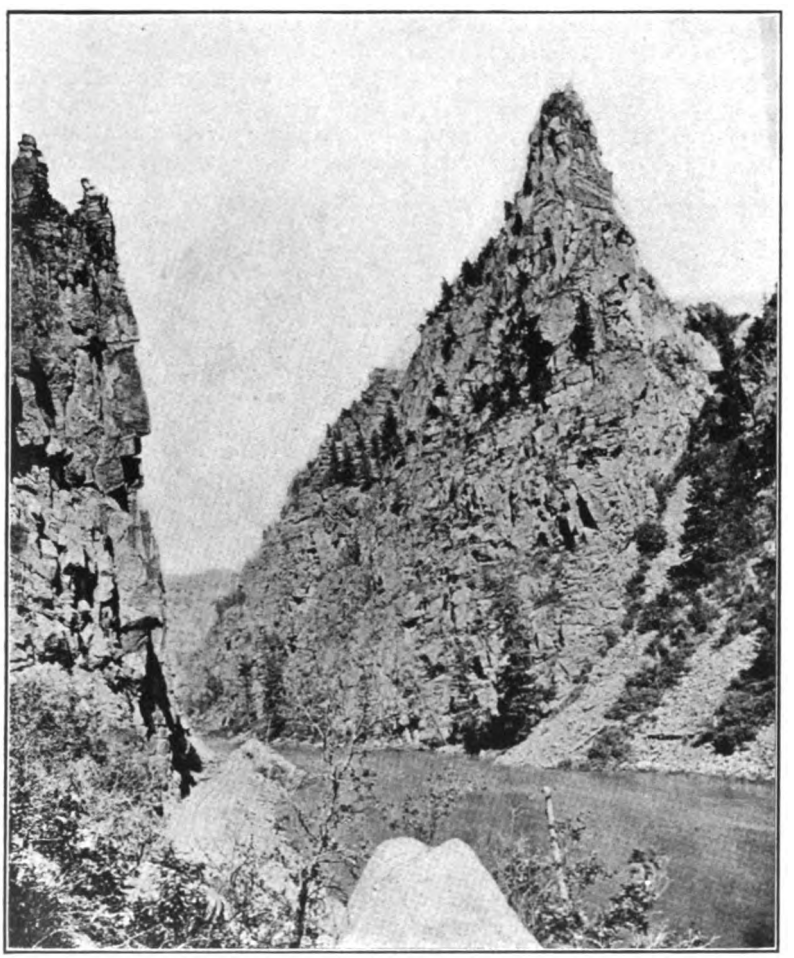
Transcontinental Tour B leaves Los Angeles for a return to New York by the so-called southern route, reaching the Atlantic seaboard at Atlanta, Ga., and continuing the journey over what has been termed the national highway from New York to Jacksonville, Fla. As outlined this tour is expected to occupy at least 29 days.

Those who desire to return to New York by a more direct route may do so by traversing the Sante Fe trail from Phoenix, Ariz., to Denver, Col., connecting at the latter point with Transcontinental Tour A, or with roads leading to Kansas City, St. Louis, etc. Full information as to running time, mileages and road conditions may be obtained from The Automobile Journal, or the boards of trade and automobile clubs in Phoenix, Colorado Springs, Denver, or other cities of that section will give the tourist necessary data. Space does not permit of presenting more than the two transcontinental routes in detail.

Massive Granite Walls That Guard the Entrance to the Yosemite Valley in California.

Much of the information contained in the two itineraries presented was prepared for The Automobile Journal by Dr. C. G. Percival, who recently covered much of this territory in the Abbott-Detroit "Bull Dog." He suggests that as E. L. Ferguson had previously routed many of these highways, particularly the southern route, while accompanying the Ohio "Mud Hen" on its famous transcontinental journey of 1910, due credit should be given that source as well.

The tour listed as Pacific Coast South, is designed to connect the two transcontinental tours between San Francisco and Los Angeles. That denominated Pacific Coast North offers an interesting side trip to Seattle, Wash. It may be said in this connection that Dr. Percival is believed to be the first to route this tour in detail and that this is the first presentation of his information in the East.



It will be noted that Transcontinental Tour A leaves the main route across country at Julesburg, Col., for a visit to Denver. This suggestion lengthens the tour by at least one day, as it would be possible to drive from Julesburg to Cheyenne, Wyo., in a direct line. This detour is made for the purpose of offering the tourist an opportunity to visit Denver, and

Digitized by Google

connect there for the famous drive to Colorado Springs and the Garden of the Gods. Other touring information to be presented in The Automobile Journal throughout the touring season will go into this section in still more detail.

The same thing will apply in a measure to the visit to Salt Lake City, since it would be possible to reach Ogden, Utah, direct from Green River, Wyo., reducing the mileage materially. It is believed, however, that these detours will be appreciated by the tourist, and it is probable that still other places of interest will be included in the itinerary, when this section of the country has been reached. The Automobile Journal is prepared to supply information covering practically all points of interest and will be only too glad to place the tourist in communication with those who can aid in the proper selection of such points to be reached within any definite specified time.

The road conditions over the routes selected in these itineraries are considered as the best that obtain in the respective districts. In many places, the tourist will be surprised to find that modern macadam has replaced the ancient trails of the Indians. The good roads organizations throughout the West have been particularly active during the past year. Unless weather conditions interfere the tourist should experience no difficulty in making a transcontinental tour today.

Currecanti Needle in the Black Canyon of the Gunnison, Another of Colorado's Natural Wonders.

From a close study of the itineraries, it will be noted that in various places the route does not touch towns or settlements except at rare intervals. It is not anticipated, however, that the tourist will find it difficult to follow the itinerary as given, since the motoring clubs of the Rocky mountain district have been exceedingly active in posting the roads. In many places the highway will be found so thoroughly supplied with guide boards that routing directions would prove superfluous.

There was a time when it was considered absolutely necessary to equip the car with some sort of camping paraphernalia to be used after leaving Denver on the western trip. The roads have been improved so materially within the past year, that this is now quite a matter of option with the tourist. On Transcontinental Tour A there is but one point where it is possible that such equipment might prove advisable.

The road from Elko, Nev., to Eureka and Austin is not ideal in many places. It would depend largely upon the weather conditions as to whether or not the car would be able to reach Austin in one day. If everything were favorable, no trouble ought to be experienced. It is advisable to secure a liberal supply of gasoline at Elko, for although fuel may be obtained at Eureka, it commands an excellent price.

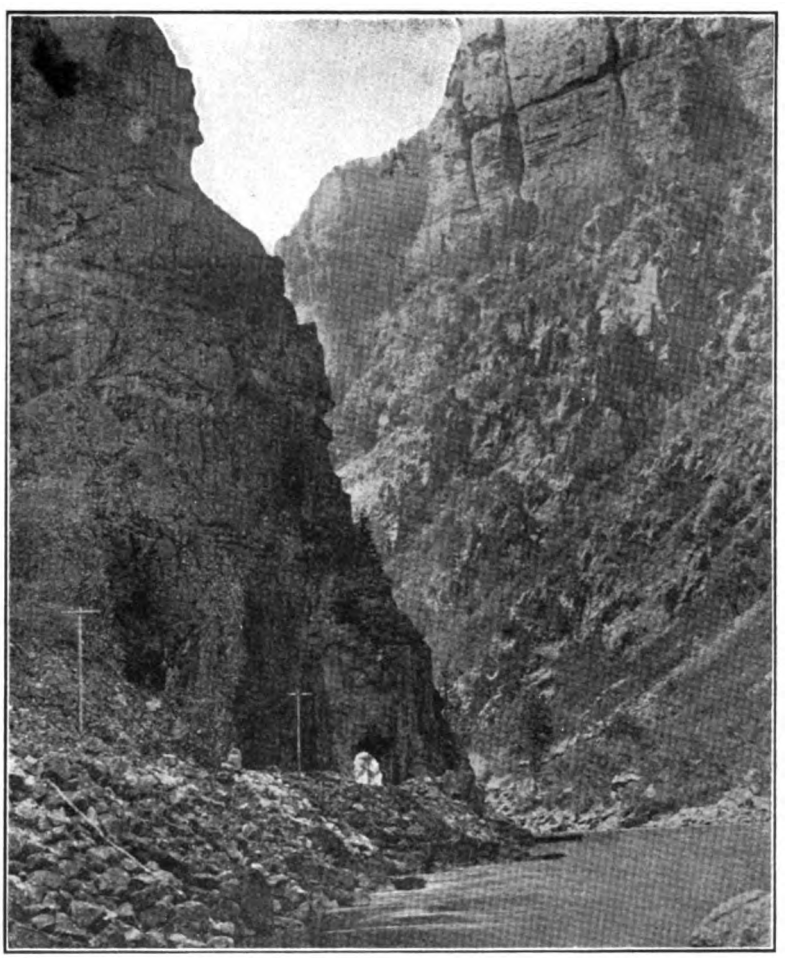
On Transcontinental Tour B, the roads in many places in Arizona, New Mexico and Texas are decidedly in contrast with those of the East. Macadam ways will appear at most unexpected points, and at others, the trail will be but dimly outlined, appearing to go in the wrong direction at times. It is best to make frequent inquiries. Ranches and settlements are sufficiently near together to make camping unnecessary, except under the most unfortunate circumstances.

It is anticipated that the tourist will appreciate the information covering the South, which is presented in this connection. It will be admitted that New York City might be reached over shorter routes from many points on this

Digitized by Google

itinerary. It would be possible, for instance, to connect with Kansas City from Fort Worth, Tex., or with St. Louis from Forrest City, Ark. But there is much interesting scenery in Mississippi, Alabama and Georgia, which ought to become more familiar to the American citizen.

Of course, the Blue Ridge country has a historical interest all its own. Many of the famous battlefields are passed on this itinerary, and opportunity should be taken to visit these scenes if time will permit. Accompanying illustrations indicate that nature has been quite liberal in endowing the Atlantic seaboard, south of Washington, with phenomena which are little known to the people of the North.



The roads throughout this section have been improved materially within the past two years. It will be found, however, that in many places extreme care in driving will be necessary. Still, the tourist that has passed the dangers of the Rocky mountain district and of the desert country of the Southwest will have little difficulty in traversing these ways.

Reference already has been made to the illustrations, but particular attention may be called to those accompanying this transcontinental touring section. Many of the natural wonders presented have peculiar significance to the American, who may have long desired to visit these localities. Undoubtedly he has been deterred heretofore by the fact that it would mean a long tiresome railroad journey. The rich mountain scenery of Europe, mention of which will be found elsewhere in this issue, has been decidedly more available to the motorist.

The people of the West, in their desire to act upon the suggestion that Americans should "See America First," have so planned their good roads movement that it includes a large number of these natural wonders. For instance, the Grand Canyon of the Colorado is now quite as easy of access to the motorist as Niagara Falls. An excellent automobile road runs to the most interesting portion of the splendid gorge from Phoenix, Ariz., and it may be added that the government has aided materially in bringing this about, with its macadam way to the Roosevelt dam, so-called, and through the famous Superstition mountains.

Good roads also lead to the Yosemite valley, where it is possible to gain a close view of the giant trees, the well known Bridal Veil falls and the other beauties of this prehistoric California forest. Unfortunately, while good roads lead the tourist to the very gateway of Yellowstone national park, automobiles are rigorously excluded from the park itself. This is not true of the Garden of the Gods, however, and the tourist may spend a number of days in the vicinity of Denver with profit.

To include a full list of the magnificent mountain and valley scenes now possible of reach on a transcontinental tour would prove impractical. It is sufficient to state that the tourist who follows the itineraries listed below cannot fail to appreciate the remarkable resources of the country.

Some of the Picture Rocks in the Grand Canyon of the Colorado, Now Within Easy Reach by Automobile.

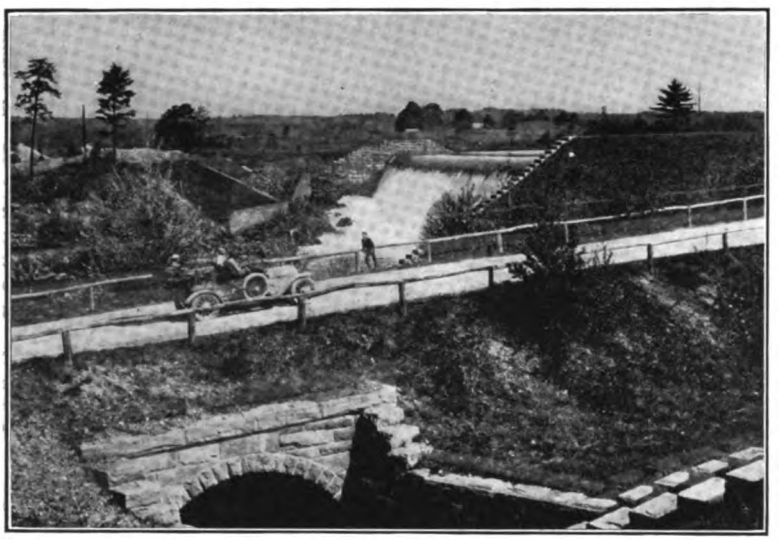
THREE SPLENDID VACATION TOURS.

The First Itinerary Covers the New England States, Including the White Mountains, the Maine Woods and Numerous Seaside Resorts.

Vacation Tour No. 1 contemplates that the tourist start from New York City and be gone 10 days. It covers almost the whole of New England, visiting the beautiful Litchfield hills, as well as the Housatonic and Naugatuck valleys the first day; spends the second in the Connecticut valley; the third in the Green mountains and around Lake Champlain; the fourth in northern Vermont and the upper Connecticut; the fifth in the White mountains; the sixth in the Rangeley lake section of Maine; the seventh in the Maine woods; the eighth along the North Shore; the ninth in Rhode Island, and the tenth on Long Island.

The Litchfield Foothills of Southern Connecticut Furnish Mild Climbing Tests as a Foretaste of the Mountains.



Leaving New York the first day, the route lies through the metropolitan residential suburbs of New Rochelle, Larchmont, Mamaroneck, Rye and Portchester to Greenwich, Conn., which with its many splendid homes, is also a suburb of New York. At Stamford, a pretty little city with handsome drives, the tourist turns northward into the Litchfield foothills. Ridgefield is well known to New York people as a summer place. It gains its name because of a lofty ridge, called by the Indians Caudatowa. In May, 1777, a little band of militiamen here cost Gen. Tryon 170 men before he was able to capture the defense. On the way to Danbury, is to be seen the monument raised to Gen. Wooster, the commander of the Continental forces, by the Masons, who have a particular regard for his memory, because of the fact that he instituted the first lodge in the state, Hiram of New Haven.

Danbury is the home of the hat industry, the first American hat factory being located here in 1780, when Zadoc Benedict, with three men, was able to produce three hats a day. The town was destroyed by Gen. Tryon in his memorable raid of May, 1777, and with it a large quantity of army supplies stored there by the colonists. The road now descends into the Housatonic valley and then, up the hill to Newton, where Beecher said "the hills first begin to show mountainous symptoms." There is a good deal of up-hill and down-dale between this point and Middlebury, which is a quiet little town among the hills and the seat of Westover School for girls.

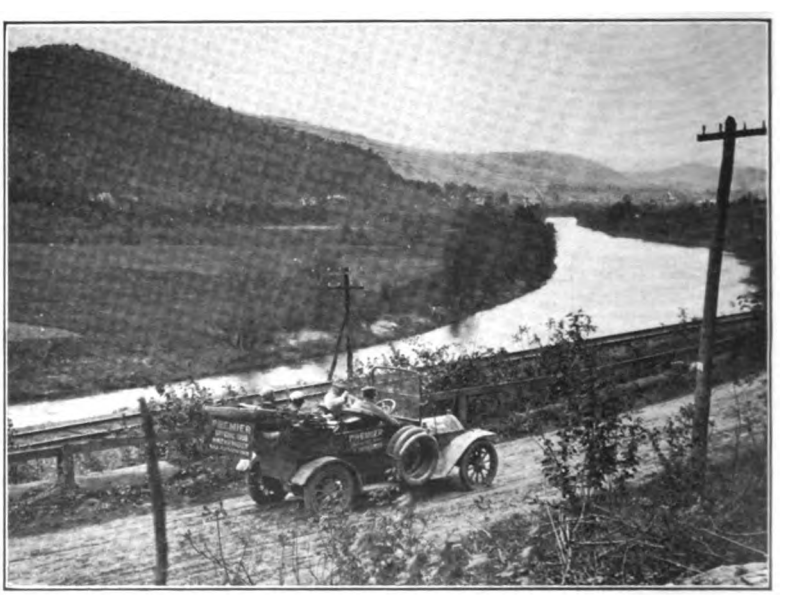
Waterbury is in the Naugatuck valley, and is the seat of the brass industry. The tourist will do well to forget his "Waterbury watch" jokes, because the people of the Brass city do not take at all kindly thereto, although watches and clocks still continue to form a large portion of its manufacturing life. Shortly after leaving West Cheshire the route lies over the famous Southington mountain, which is no longer formidable, owing to the system of road grading which has been carried out at this point. Lake Compounce is near the foot of the mountain.

Plainville was once a large carriage manufacturing centre, but the growth of the automobile industry has affected it very materially. Splendid macadam roads take the tourist through New Britain, where Elihu Burritt, the learned blacksmith, was born in 1811. The water supply is furnished from a large reservoir, located 200 feet above and in the heart of the city. Hartford, the night stop, is the capital of the state and has a number of very pretty parks. The view from the capitol dome is a particularly pleasing one.

Digitized by Google

Where the Chicopee River Empties Into the Connecticut.

The entire second day is spent in the valley of the Connecticut river, with its system of splendid roads. Crossing the new stone bridge into East Hartford the tourist enters the tobacco country just north of that town. For miles, on either side of the river fields of this crop will be found, studded with numerous tobacco barns. At Warehouse Point will be noted a steel truss railroad bridge, which is considered a noble piece of engineering, made in Manchester, England, and set up here in 1866. Enfield was settled by Salem men in 1681, but the town itself has almost lost its identity because of the carpet making establishment at Thompsonville.



Longmeadow is the first Massachusetts town entered, and its wide streets with excellent macadam surface once made the motorist unhappy because of the very efficient speed trap located there and presided over by one Hanratte. A little later, as the tourist descends Pecusic hill at Forest Park, a splendid view of Springfield, the City of Homes, is seen, spread out like a panorama before him. Time may be spent profitably in a visit to the Springfield Arsenal, the subject of Longfellow's poem by that name, concerning which it is said no better view in the wide world can be secured than from its roof.

Chicopee, at the confluence of the Chicopee and Connecticut rivers, is the home of the Ames foundry, in which the superb bronze doors of the United States Senate chamber were cast during the Civil War. The doors of the House of Representatives were made in Munich, and the Senate doors were to have been cast in the same place. The over-prudent Bavarians demanded their money in advance, and the Government decided to try home production. The work of the Chicopee foundry, while little was hoped or expected from it, challenges comparison with the best from the Munich concerns.

The South Hadley Falls at Holyoke present a pretty scene as the route turns over the hills for a brief period, long enough to visit Mt. Holyoke College, for girls, at South Hadley. At Amherst, is Amherst College, with a handsome campus, though in many respects it by no means compares with that of Mt. Holyoke. Amherst was the home of Eugene Field, and many of his richest poems were written under these trees. The Massachusetts Agricultural College is located at North Amherst. Some mention also should be made of Mt. Holyoke and Mt. Tom, one on either side of the river, and both of which are seen from a number of points on the tour.

Crossing the river at Sunderland, under the sheltering shadow of Mt. Toby, the way leads along the foot of Sugar Loaf mountain, the scene of some of the bloodiest tragedies of the King Philip and later Indian wars. King Philip is said to have directed the movements of the western Indians from his headquarters on this mountain, and Table rock, a beetling cliff on the east side, has a seat cut in the side, which is called King Philip's chair.

In the northern part of South Deerfield is a monument on the Blood Brook battlefield. Sept. 18, 1675, Capt. Lathrop and 84 men were conveying a train of grain wagons from ruined Deerfield to Hadley, and as they passed this brook they halted to rest and pick some luscious wild grapes which hung in clusters over its waters.

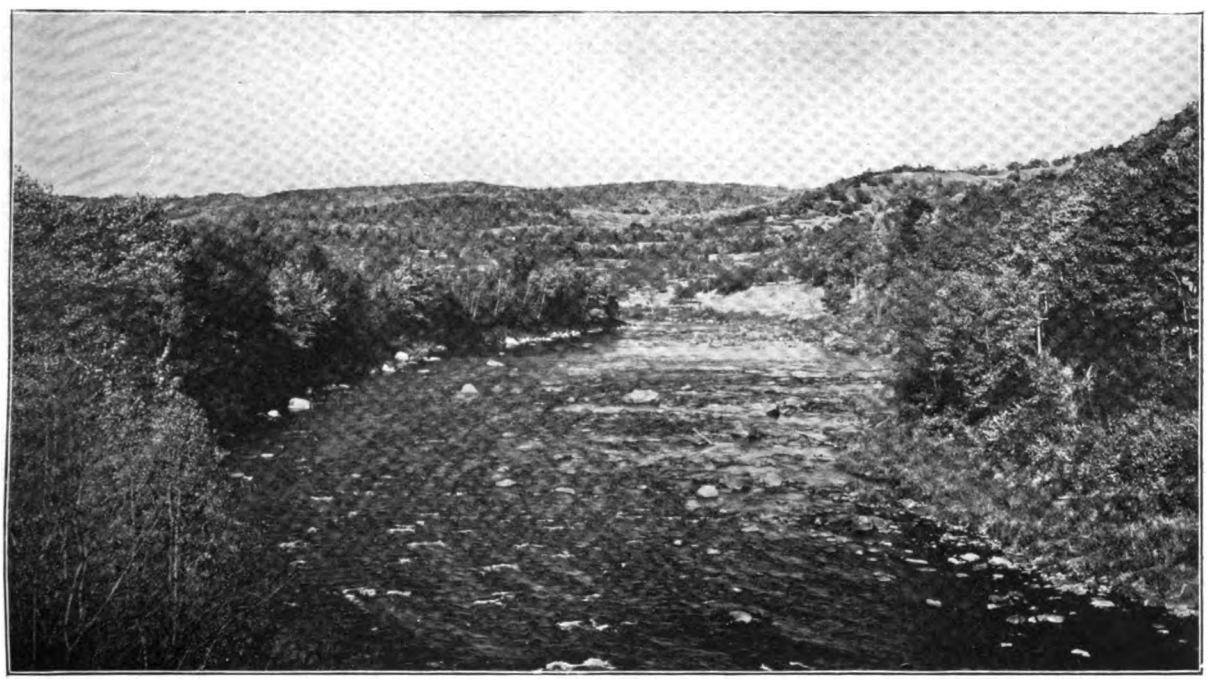
Connecticut Valley Supplies Beautiful Mountain and River Scenery.

Digitized by Google

While they were thus engaged 700 Indians fell upon them, and but seven men escaped.

Deerfield was sacked and burned and then abandoned shortly before this battle. Later it was settled again by a number of younger men, and in 1694 it was again attacked, although ably defended by the settlers, headed by their pastor, Rev. John Williams. Feb. 29, 1704, a third attack was made, and this time the village was destroyed again, only one house remaining. One hundred and twelve captives were taken to Canada, where they were held for ransom. Memorial Hall contains an excellent collection of historical relics.

Soon after passing Greenfield, the route crosses the river again into East Northfield, the seat of the Moody School for girls, and of other institutions organized and perpetuated by Dwight L. Moody. Mt. Herman School for boys is only a short distance away.



Entering Vermont at Vernon is noted the magnificent dam across the river, which furnishes Brattleboro with a splendid lake front. The electricity generated at this dam furnishes light and power for numerous towns in northern Massachusetts, as far distant as Worcester. Brattleboro is naturally very beautifully situated and is the business centre for a large area in both Vermont and New Hampshire. The Estey organ works here are of especial interest.

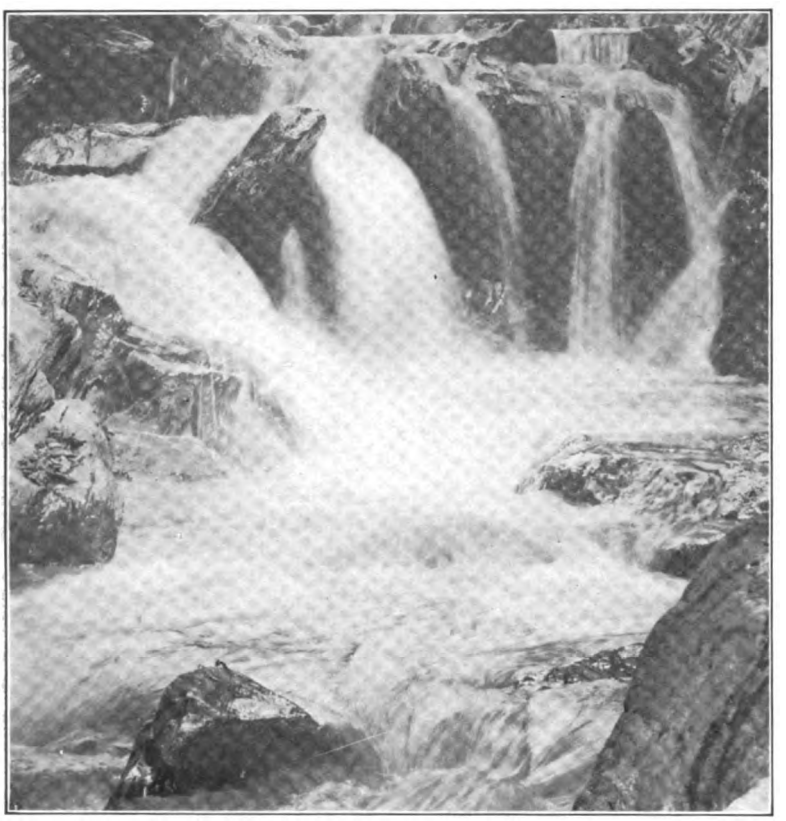
In Putney are long strata of roofing slate, and the rare mineral, fluor spar, of a rich emerald green. In 1775, a strong timber fort was erected, which protected the settlement until the conquest of Canada made it unnecessary.

Bellows Falls was a favorite Indian resort, because of the large number of salmon and shad near its rapids. A short distance above the old bridge at this point are a number of hieroglyphics, which Schoolcraft decided were the records of an ancient battle. The river falls 42 feet within half a mile of the village, forming a white and impetuous rapids.

Charlestown, N. H., was settled by Massachusetts people and was originally named Number Four. Between 1746 and 1760, it was repeatedly attacked and conducted a defense so admirable that the enemy decided at last to abandon the conquest. During the later French and Indian wars it was a military station. It is situated between two broad, rich meadows, and has a long, wide, well shaded street.

Ascutney mountain comes into view just above Claremont, and the river is recrossed into Vermont at Ascutneyville. At Windsor, during a heavy thunderstorm and with the news of the fall of Fort Ticonderoga ringing in their ears, the deputies of the Vermont towns adopted the state constitution, July 2, 1777. Ascutney, the name of the mountain, which is easily reached from Windsor, was Indian for Three Brothers, and is supposed to refer to the three singular valleys which run down its western slope. Early settlers claimed they often saw a curious light overhanging the peak at night. White River Junction is the night stop, at the union of the White and Connecticut rivers.

The Deerfield River Rushes on Its Way to Join the Connecticut from the Berkshire Hills.



The third day, the route follows the picturesque White river for a time, branching off to climb the Green mountains toward Montpelier. Joseph Smith, founder of Mormonism, was born in Sharon. At Royalton, occurred the last attack by the Indians on New England in October, 1780. Two hundred redskins plundered and burned the village, as well as Sharon, and captured 27 of the people.

Bethel is a busy manufacturing village among high hills. A little further along is the famous Williamstown gulf, through which it is seldom indeed that cool breezes

Digitized by Google

do not blow. The view from this point to Barre and Montpelier is most superb. Montpelier, the capital of the state, is situated on a plain near the Winooski river, and is surrounded by fertile hill farms. Under the portico of the State House are two cannon taken from the Hessians in the battle of Bennington in 1777, after a desperate struggle. The British got them back, but they were retaken by the Americans during the Canadian campaign, and were presented to the state by Congress.

Near Middlesex, the river passes through a gorge 30 feet deep, 60 wide and 1300 long, which has been worn by the action of the water. Waterbury abounds with pleasant rambles and drives, with frequent glimpses of Camel's Hump and Mt. Washington. Bolton Falls are also near by. The road now descends toward Lake Champlain, along the valley of the Winooski, the Adirondacks coming into view now and then.

View of Little River as It Tumbles Over Bolton Falls, Vermont.

Burlington, the Queen City of Vermont, has several fine buildings, among them St. Paul's Episcopal Church of blue limestone and with beautiful stained glass windows. The University of Vermont occupies a commanding position on a high hill, and near this is Green Mountain Cemetery, in which lies the body of Ethan Allen, under a Tuscan column 42 feet high.

Near Winooski is the romantic canyon on the river, and at High Bridge, the impetuous stream has cut a gorge through the solid rock 90 feet deep and 70 feet wide. St. Albans is the night stop, located on an elevated plain, three miles from Lake Champlain. A neat park of four acres in the centre of the city, is surrounded by hotels and numerous public buildings. A Norman-towered Episcopal church of red sandstone is most noteworthy. A magnificent view may be had from Aldis hill, about a mile to the northeast.

The fourth day takes the tourist first to Sheldon, near which are located the famous mineral springs. That near the Missisquoi Falls has had an enviable reputation. From Dunton's hill, a vast panoramic view of the Green mountains is obtained, while the silver waters of Lake Champlain, the Adirondacks and the spires of Montreal are to be included in the scene. At Richford, Jay peak rises to an altitude of over 4000 feet.

Newport is located at the upper end of Lake Memphremagog, and from the edge of the town rises Prospect hill, from which excellent lake views may be obtained. The lake is 30 miles long, and two-thirds of it lies in Canada. Barton Landing was the scene of much smuggling during 1810-15. At Barton, may be seen Crystal lake and the Flume, where a brook flows through a natural passage in the granite rock, 170 feet long, 10 wide and between 20 and 30 deep. The granite walls are smooth and perpendicular. In 1810, the people of Barton determined to widen Barton river by turning Long pond into it. They barely had completed a channel, when the waters burst through with tremendous force and swept down to Lake Memphremagog, wrecking everything in their path and causing immense damage. The bed of Long pond is now dry and is called Runaway pond.

Numerous rare plants are to be found along the sides of Lake Willoughby, a magnificent sheet of water on the way to Lyndon and St. Johnsbury. At the latter place considerable interest attaches to the works of the Fairbanks scales concern, particularly those which are made for use in oriental countries, with their Chinese and Turkish numerals marked thereon. The Passumpsic river and its black, rock banks is crossed at this point.

From the hills in the vicinity of Littleton, N. H., may be had a fine panorama of the White mountains, and a little later the tourist enters the White mountain region at Bethlehem. No more beautiful view of the entire range can be secured from any other point. To the north and west are the mountains of Lancaster, the Percy peaks, the Pilot mountains and the great Presidential range. The night stop is at Bretton Woods, the very centre of the entire district.

The fifth day gives ample opportunity to test the car on mountain roads, but if additional trials are desired it is possible to connect

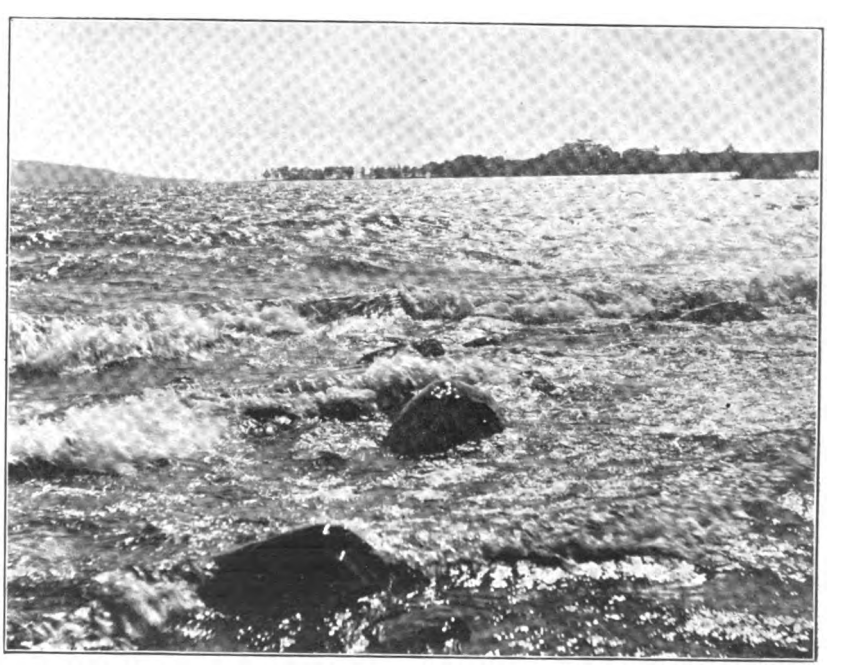
Digitized by Google

One of the Many Gorges Worn by the Winooski River in Vermont.

with the road to the summit of Mt. Washington at Cherry Mountain or Gorham. For river scenery, combined with the impressive mountain forms, the vicinity of Gorham surpasses all the other districts from which the highest peaks are visible.

The drive to Gilead, Me., is along the river, with ever changing hill scenery on either hand. This continues through Mayville, North Bethel and Newry to Rumford Falls. Here the descent of the Androscoggin is over 150 feet in three or four plunges over ragged granite ledges. The third fall has a nearly perpendicular drop of over 70 feet, and its roaring is heard at a great distance.

From this point the route enters the Maine woods on the way to Rangeley lakes, passing through Mexico, Dixfield, Weld, Webb and Madrid. Many summer camps and once in a while a farm house serve to break up the monotony of the continual forest, of which there are nearly 100 square miles in this region. The trip is by no means uninteresting, however, for something new in the way of scenery is being spread out before the tourist all of the time. The elevation of the lakes is about 2000 feet, and the pure air and sparkling water make it a most desirable spot in which to spend a summer's vacation.



During the sixth day, the tourist has many more miles of Maine woods before him. The route from Rangeley lakes to Skowhegan, by way of Dead River, Green Farm, Stratton, Flagstaff, North New Portland and North Anson, is somewhat better known by automobilists than that over which the tour reached Rangeley. The scenery, still that of the woods, interspread with numerous ponds and lakes is fully as inspiring as any in New England.

After leaving Skowhegan, fine fishing country is visited on the way to Pittsfield and Newport, the latter town being located on the shores of East Pond, which is 15 miles in circumference and affords most excellent fishing. The night stop is at Bangor, in size the second city of the state, and the second lumber mart in the world. The approach to the city, by way of Etna, Carmel and Hermon, gives commanding views of the hills at head of navigation on the Penobscot. The tributaries of of this river penetrate the great Maine forest in every direction, and bear downward to this city immense quantities of lumber, work on which may be seen at numerous places en route.

The river is quite as picturesque below Bangor. During the war of 1812, the British attacked Hampden, plundered and overran the town for three days. Between Winterport and Frankfort may be seen the granite quarries around the base of Mt. Waldo. Belfast is a handsome little city built on a declivity which slopes to the water, with wide shady streets.

The route now passes along the Penobscot bay, with its views of Mt. Desert in the distance. Camden is a pretty little town, with the two Megunticook peaks and a number of other smaller mountains to complete a picturesque group. Hills continue to furnish the change of scenery through Rockport and Rockland, the latter situated on Owl's Head bay. Here ship building is carried on, but the chief industry is lime burning. The kilns should be seen at night, and make a splendid addition to the hill and marine scenery about the city.

Thomaston is located on a deep,

When a Summer Breeze Stirs Up the Waters in St. Albans Bay, Vt.

Digitized by Google

narrow harbor, and is the site of the Maine state prison, established in 1824. This was the scene of a sharp naval battle in 1724, when a fleet of 24 vessels, composed for the most part of captured fishing boats, engaged the colonial relief ships, which were forced to retire, greatly damaged by the Indian artillery. The fort which was built in 1720 withstood all attacks and was still standing during the Revolution.

Warren, another ship building town, was settled by Scotch and Irish in 1736. Waldoboro was settled by 1500 Germans in 1753, and some of their descendants still remain. Woolwich was founded in 1638, its Indian name being Naquasset, but was depopulated by an attack in 1696. It was rebuilt in 1759. William Phips was born in this town in 1651, and was a shepherd on its rocky hills. Later he learned the art of ship carpentry and in 1687, he succeeded in locating a Spanish treasure ship near the Bahamas, recovering something like $1,500,000 worth of jewels and bars of gold and silver. For this he was knighted by the king and received $80,000 of the treasure.

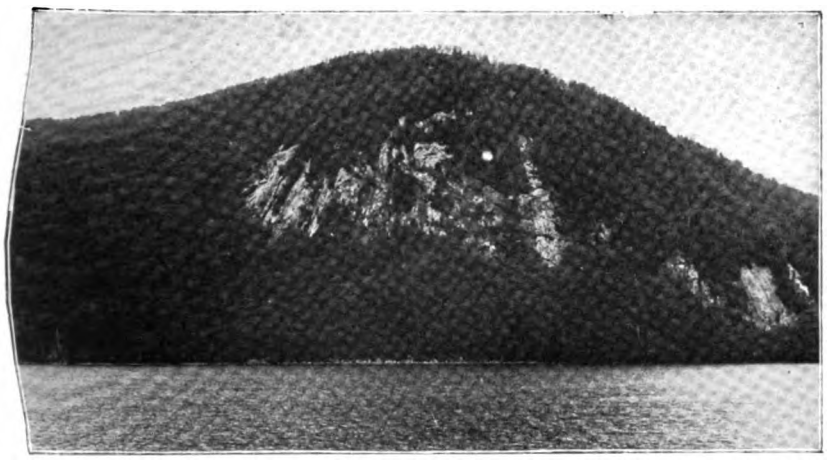
Bath was once a wealthy city, until the decline in American commerce seriously affected its ship building industry. It has a fine harbor, rarely bothered with ice, and the Kennebec at this point is very beautiful. The river is half a mile wide, and is rapid and deep. Some of the best shipbuilding lumber is floated down from its head waters.

Brunswick is a prosperous town at the falls and the head of the tidewater on the Androscoggin. The river falls 41 feet in three pitches and furnishes power for numerous factories. The city is also the seat of Bowdoin College. The pine groves in the rear of the college buildings are widely known for their sombre beauty.

Portland is the night stop. The city is situated on a high peninsula at the southwest end of Casco bay. Its harbor is deep, well sheltered, and is defended by powerful forts, while its numerous islands afford favorite resorts during the summer season. Portland has been devastated by fire several times. It was burned by the Indians and British, and several large fires have destroyed portions of it since.

Near Biddeford, may be seen the ruins of Fort Mary, built in 1708. A quaint old house of the 17th century is also of interest. Between Saco and Kennebunk the tour crosses the Saco river, and at Biddeford may be seen the falls, which furnish power for a number of towns in that vicinity. Several of the famed Maine beaches are passed as the tourist proceeds on his way to Portsmouth, N. H.

This is a quaint and pleasant old city, with some very remarkable examples of colonial architecture. The old Church of St. John is worthy of a visit, as well as the Gov. Wentworth mansion at Little Harbor. This latter is a large, irregular building, dating from 1750, and contains the old provincial council chamber and many quaint relics of the past.



The tour is arranged to visit the beaches in this immediate vicinity, all of which are famed for their beauties. The old chain bridge, three miles west of Newburyport, is the second suspension bridge in the world and the first in America. The Newburyport silver mines, which were opened in 1875 and for a time yielded richer ore than those of Nevada, are also near the city. Newbury was settled in 1635, and for many years was noted for its wealth and aristocracy.

Rowley is a town composed largely of salt marsh. It was settled in 1638 by a nomadic church, led by Ezekiel Rogers. In 1650, he died, leaving his library to Harvard College. The first cloth made in America was turned out by these early settlers. Ipswich was the home of Cotton Mather. The town was purchased from the Sagamore Masconmet for $100 in 1633 by John Winthrop,

One of the Views of the White Mountains from Bethlehem, N. H.—Mt. Washington in the Distance.

Digitized by Google

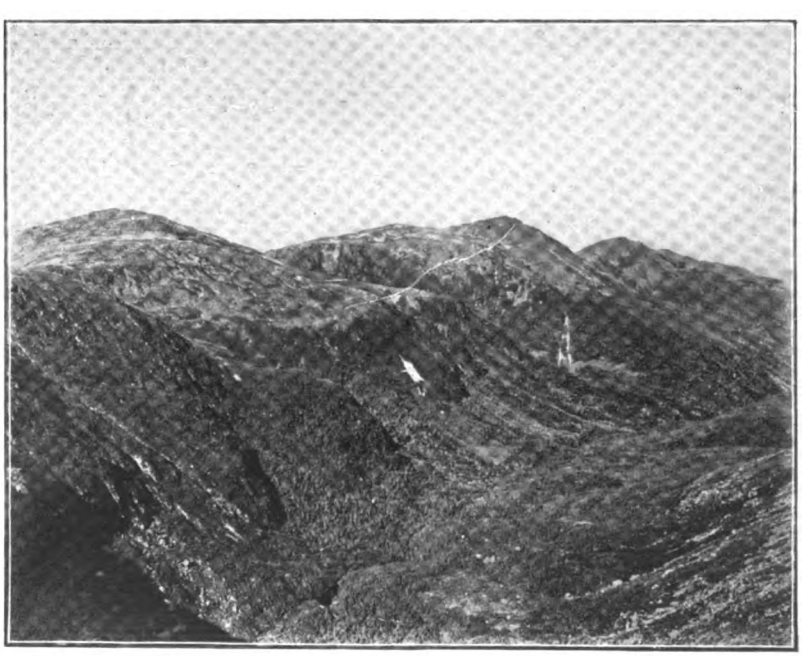
Where Mt. Hor Raises Its Head Above Willoughby Lake at West Burke.

the first governor of Connecticut.

Wenham lake has a world-wide reputation for its ice, which is shipped to remote parts. This ice is kept entirely free from snow and is harvested when about a foot thick, yielding about 1000 tons to the acre. Beverly is now known as the summer capital, it being the vacation home of President Taft. Other North Shore towns passed on the way to Boston, are Salem, home of Salem witchcraft, with its witch's hill, the East India Marine Hall, Plumber Hall and other historic associations; Lynn, with its first shoe factory in America, its Dungeon rock, where pirates are said to have held sway and the home of Molly Pitcher; Revere Beach, a favorite summer amusement park; Somerville, one of the richest suburbs of Boston; and Cambridge with its Harvard University, Washington elm and Longfellow's home.

Boston is filled with points of interest, but a bare mention of some of them will suffice. These would include the Old South church, Paul Revere's home, the old State House, Faneuil Hall, the Public Gardens, the library, the Christian Science church, the Museum of Fine Arts, and other equally famous buildings and places. From this city to Providence the way is over macadam for its entire distance.

The wide streets of Dedham are over-arched with handsome elms, and the sidewalks are fringed with arbor-vitae. Among the points of interest may be mentioned St. Paul's church, a handsome Gothic structure, and the ancient cemetery alongside it. The town has many old mansions in wide and pleasant grounds, and is considered by many to be the most beautiful town in eastern Massachusetts.



Pawtucket, R. I., was the scene of the total destruction of Capt. Pierce and his 70 men in 1676. Surprised by the Indians he was driven back to the river by a shower of arrows, and when help came not one man was left. It is the home of the first cotton mill in the country, a building which is still standing and may be seen above the falls of the Blackstone river in the centre of the city.

Providence was settled by Roger Williams, after being driven out of Salem. The city abounds with memorials to him, and his body rests in North cemetery. There are many places of interest, includ the state house, with its handsome portrait of Washington; the ancient First Baptist church, founded by Roger Williams; the Athenaeum, with its wealth of fine paintings; and the buildings of Brown University.

On the way to Apponaug, the tour passes Roger Williams park, given to the city by Betsy Williams, great-great-granddaughter of the man whose name it bears. It includes 100 acres of beautifully diversified land and the venerable gambrel roofed home of the donor. At Wickford may be seen the curious old square Episcopal church built in 1707, the block house erected for defense in 1641, and the rolling rock, where Roger Williams and Canonicus signed their compact.

This is all historic country, and recent discoveries in the hieroglyphics on some of the rocks proclaim that it was at this point Norsemen first landed to communicate with the Indians hundreds of years before the discovery of America by Columbus. On the way to Saunderstown are the ruins of the old Narragansett fort on the edge of the pine and cedar swamp.

Narragansett Pier is one of the best known shore resorts in the

View of Franconia Notch and Bald Peak in the White Mountain Region.

Loon Lake, One of the Small Bodies of Water in Rangeley Lake Region.

country. It is at the height of its glory during the touring season, when its many large hotels are filled with prominent people. Then comes Wakefield, Charlestown and Westerly, the latter the home of the Seventh Day Adventists. If the tourist happens to reach this town on Saturday, he will find little business going on and the church bells ringing.

Of Stonington it was once written that it "suffers in religion because of its nearness to Rhode Island." However true that may have been at that time, it certainly suffers nothing because of being pleasantly situated with a fine outlook upon Long Island sound. Its quiet streets are embellished here and there by iron relics of 1814.

Near Mystic, is Pequot hill, the scene of the battle between the allied English and Indian forces against the Pequots. Upon arriving at the Indian fort the allies of the English at first declined to aid in the attack and the colonists decided to make the attempt alone. As they were kneeling in prayer, the sachem Wequash was so impressed with the sight that he became converted and preached Christianity throughout New England until he suffered martyrdom.

New London is the night stop, and as it is impossible to take the ferry to the eastern end of Long Island until 10 in the morning, some time is to be found for exploration. There are several points of interest in and about the city, among which may be mentioned the only house still standing, which was left by Benedict Arnold when he burned the town during the Revolution; the building in which Nathan Hale taught school, now standing near "Ye Anctient-ist Burying Ground," and others.

Reaching Sag Harbor about noon, the return to New York is made across Long Island; for a time along the south shore and later changing to the sound side. This will be found a pleasanter trip than along the Connecticut shore line, because of less traffic, and the roads are equally as good. Even those who are familiar with Long Island scenery will always find new views to enjoy, and while these may not be as impressive in their grandeur as the mountains and woods encountered earlier on the route, they will leave many pleasant memories and offer suggestions for further short trips.

Digitized by Google

VACATION TOUR NO. 2 VISITS CANADIAN POINTS.

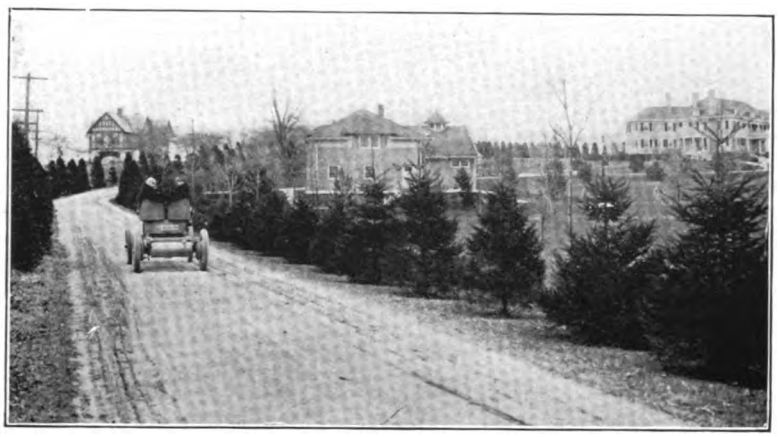
As with the preceding, Vacation Tour No. 2 is outlined to start from New York City. The first day crosses Westchester county and visits the Litchfield and Berkshire hills; the second is spent in the Green mountains and ends on the banks of Lake Champlain; the third, fourth, fifth, sixth and seventh find the tourist in Canada; the eighth covers western New York; the ninth is in northwestern Pennsylvania, and the last day in northern Jersey. This last state now grants reciprocity and is, in many respects, ideal touring country.

Those who have visited England and have enjoyed the English custom of sipping tea in the quaint little tea rooms located at numerous points along the many drives, will recall these experiences upon catching glimpses of the tea houses scattered throughout the district between New York City and Briarcliff Manor, and beyond that point for some distance. This section is familiar touring ground for metropolitan motorists, who often find it pleasant to drive out to Lake Mahopac and spend the afternoon amid quiet surroundings.

It is the lake country of the beautiful Croton district, and beside Mahopac, Lakes Waccabuc, Oscawana and Peach each have their own peculiar charm. Lake Titicus is on the way to Pawling, near which is Quaker hill, 1300 feet above sea level and commanding a view of the Hudson and the lake country, considered one of the finest in the North. It was at this point that Gen. Washington maintained his headquarters for a time during the Revolution, and the house occupied jointly by Washington and Lafayette remains with but slight alterations. The old Quaker Meeting House, erected in 1764, is another attraction of interest.

One of the distinctive features in the vicinity of Dover Plains is Chestnut ridge, which extends north and south for about three miles and forms part of the water shed between the Hudson and Housatonic rivers. The small streams from the western hills have worn deep ravines and in several places have formed beautiful cascades. A few miles from the village, one of these streams flows down the mountains in a succession of rapids, and at the foot of each fall smooth rounded holes, called wells, have been worn in the rocks to a considerable depth. Near this, and a little higher up in the mountains, is a stream which has worn a remarkable channel in the rocks, forming a cavern with a gigantic Gothic arch, known locally as "the old stone church."

Sharon, Conn., is noted for its rural loveliness. Several splendid views of the Berkshires are to be had from its long, shady street, 200 feet wide and two miles in length. Lakeville is a quiet little place situated on the shores of Lake Wononskopomuc, on the banks of which may be seen the Hotchkiss School for boys. The town apparently is almost under the shadow of Mt. Everett, which is passed on the way to South Egremont, Mass. It is possible to make the ascent to the summit, a feat for which there is considerable rivalry each year.



At Great Barrington, a side trip may be taken to Purgatory, a curious rock formation. Monument mountain is on the way to Stockbridge. On the east side is a white quartz cliff of considerable depth, detached from which is Pulpit rock. On the north side of the mountain is the Profile. A short distance beyond Stockbridge is Lake Mahkeenac, a beautiful calm sheet of water, surrounded by hills, with the village and spires of Curtisville peering over the trees toward the south.

Stockbridge and Lenox are known for the singular purity of their air. Many summer homes of wealthy people are located in this immediate vicinity, and add their beauty to that of nature. From Bald Head is gained a splendid view of the Berkshires and the

Prospect Lake, One of the Pretty Little Sheets of Water That Dot the Berkshire Hills.

Digitized by Google

Westchester County's Splendid Roads at Briarcliff Manor, N. Y.

well-known Housatonic valley.

Pittsfield, the Heart of the Berkshires, is the first night stop. It commands a view of the Lebanon valley which is unsurpassed. Balanced rock, near by, is one of the Berkshires' greatest natural curiosities. Its height is 18 feet and its estimated weight 150 tons. Resting upon one square foot of surface, this immense boulder is so evenly balanced that it may be swayed readily with a lever or by a man's weight. A number of interesting lakes are in this vicinity, including Pontoosuc, Ashley, Silver and Morewood.

Pontoosuc lake is near Lanesboro, which is reached early on the second day. This town possesses beds of snow white granular quartz, used in the manufacture of superior cylinder glass. Variegated marble also is obtained here. Savage mountain and Constitution hill are picturesque heights a short distance away. Lanesboro was the birthplace of H. W. Shaw, known throughout the world as Josh Billings.

Midway between Mt. Greylock and Berlin mountain, is a pretty rural hamlet, South Williamstown, seat of the Greylock Institute for boys. Five miles further along is Williamstown, the reason for the existence of which is Williams College. The tour enters Vermont at Pownal, and approaches Bennington by way of the famous battlefield.

Beyond Arlington, the highway passes through the Sandgate notch, a remarkable cut in solid rock, 30 feet high, 800 long and 12 wide. Manchester is a quiet town at the base of Mt. Equinox. The sidewalks are of marble from the inexhaustible quarries on the mountains nearby. The route now enters a valley between the Green mountains on one side and the marble hills on the other, and slowly climbs up into the former. At Danby and beyond at Wallingford the lofty ridge of White Rocks is reached. Clarendon is passed on the way to Rutland.

The principal marble quarries and sawmills are at West Rutland, whence immense quantities of white marble is shipped to all parts of the world. Large gangs of saws, without teeth and cutting by means of sand poured in from above, are constantly running. A little further along the tourist reaches Castleton, where there are extensive marble and slate quarries, and at which point an excellent imitation of marble is produced by coating the slate with marble deposit. Much of this stone is taken from quarries on the banks of Lake Bomoseen, a sheet of water eight miles long and from one to 2.5 in width.

At Hubbardton, an obelisk, near the Baptist church, marks the battlefield of July 7, 1777, soon after the evacuation of Fort Ticonderoga. Rich lake views are obtained from many points, on the way to Lake Champlain and the New York state line, which are crossed by ferry at Addison Junction. The ruins of Fort Ticonderoga crown a high hill near the steamboat landing. An interesting drive along the lake shore takes the tourist to Ticonderoga itself and northward to Westport, the night stop. At Port Henry a detour may be made to Crown Point, where are to be seen the ruins of the French Fort Frederick, the ramparts of which are brilliant with blood red thorn apples, in their season, a tree which is found nowhere else in the state and is said

Lake Pontoosuc, Favorite Berkshire Picnic Resort at Pittsfield, Mass.

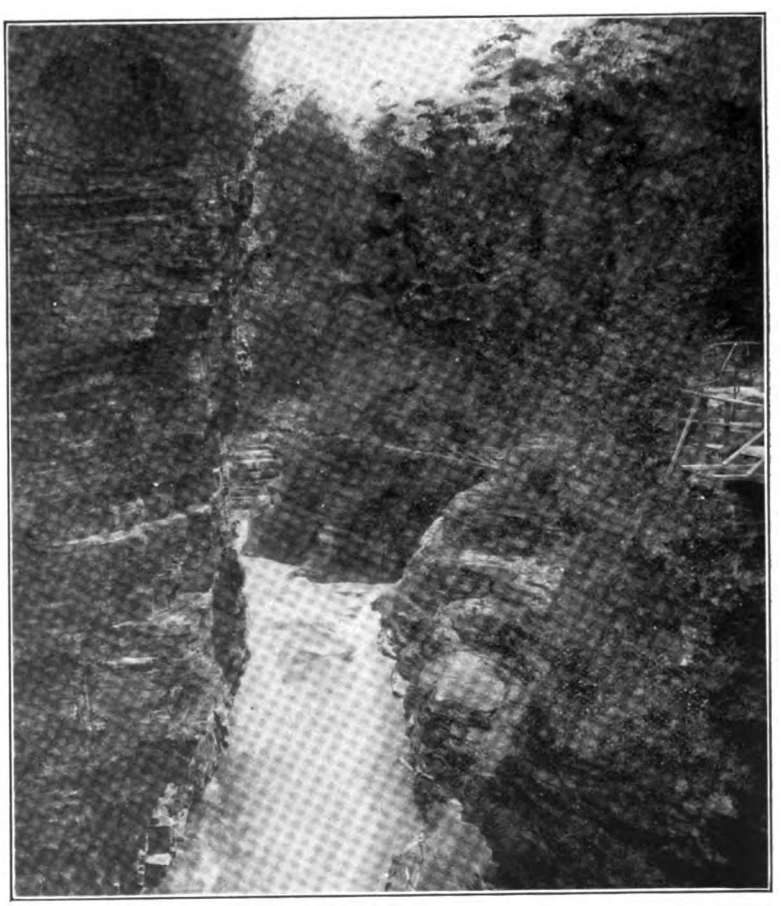
Digitized by Google

to have been brought here from France.

The tourist is now in the Adirondack foothills, and may visit the famous Ausable Chasm, with its grand succession of cascades and gorges early the third day. Keeseville, on the lake near the Chasm, is the turning point toward Canada, which is entered by way of Plattsburg and Chazy, at Rouse's Point. Here the customs regulations will have to be observed, licenses, customs bond and numbers being secured at a reasonable fee, as well as the necessary papers for readmission to the United States.

At St. Johns, Que., a chain of forts existed for years, extending along the Richelieu river from Sorel to Lake Champlain. It was the scene of a 45 days' siege by the Americans in 1775, at the end of which it fell and was destroyed. The St. Johns of today boasts of some excellent hotels and fine shops, as stores are termed on that side of the line, and also possesses a large barracks and military school. Across the river is Iberville, in which there is a curiously constructed church tower, reminding the tourist of the Turkish mosques, from the turrets of which the Moslems call the people to prayer.

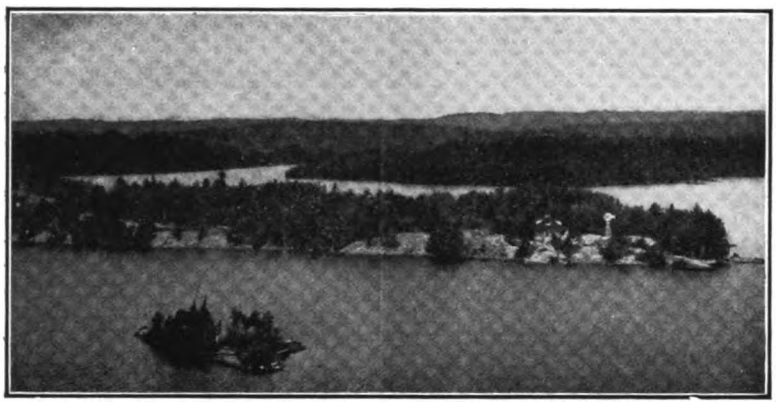
Montreal is replete with the historic and the interesting, both as the result of nature and man's handiwork. It has been successively under French and English rule, and was for a time in the hands of the Americans. In 1776, the commissioners of the Continental Congress, Benjamin Franklin, Samuel Chase and Charles Carroll, held council in the Chateau de Ramezay. The city was the scene of many battles between the Indians and white men, French, English and Americans and is filled with historic tablets and monuments.



The fourth day takes the tourist from Montreal to Ottawa. The road is of clay and in wet weather is practically impassable. Should the tourist happen to reach this point under such circumstances, he is earnestly advised to ship his car by way of boat to Kingston, and rejoin the route at that point. A somewhat better road lies along the shores of the St. Lawrence river joining this route at Prescott, but if conditions are favorable it will pay the tourist to make the trip to Ottawa, as originally planned.

The way leads across Montreal Island, thence across the Isle of Jesus and along the shores of the Lake of Two Mountains to St. Andrews East on the River du Nord. It then lies to Carillon and across the Ottawa river to Point Fortune, following the south shore of this river to Little Rideau and L'Original. At this point it turns away from the river to Alfred and Plantagenet, and back again to the Ottawa at Wendover, skirting the river again to Clarence, Rockland, Cumberland and Orleans.

Ottawa is of interest because of its being the seat of the Canadian government, the buildings of which are situated on a picturesque bluff 150 feet high, overlooking the Ottawa river. They comprise three blocks of departmental buildings, the House of Parliament occupying the fourth side of the square. The famous Chaudiere Falls, where the river dashes over a ledge of rock 1260 feet high, are located in the west end of the city and furnish power for extensive lumber operations as well as lighting and street railway plants.



The fifth day finds the tourist on good roads once more, turning back toward the States. The St. Lawrence is reached at Prescott, opposite Ogdensburg, N. Y., where connection may be made with Vacation Tour No. 3 and followed to Niagara Falls and Buffalo if preferred, or the boat may be taken to Niagara-on-the-Lake. Just below Prescott is the famous Patriot's Windmill, the scene of a bloody conflict in the uprising of 1837. The old mill is now a lighthouse. In making the water trip from the Thousand Islands to Montreal, passengers change at Prescott for smaller boats, more suitable for shooting the rapids.

The route follows the north shore of the river to Brockville,

Where the River Has Made Its Mark in the Ausable Chasm, N. Y.

Digitized by Google

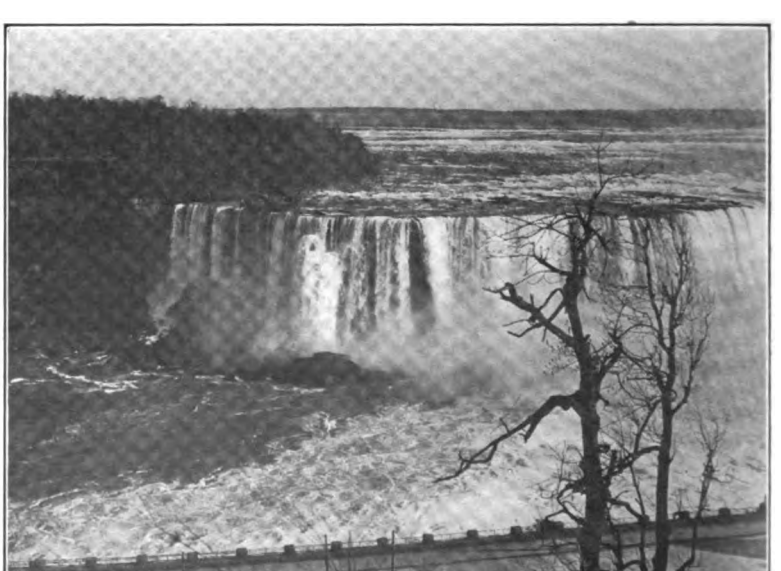
The Beautiful Muskoka Lake Country, North of Ottawa, Canada.

from which point there is a ferry to Morristown, N. Y. The road now turns away from the St. Lawrence for a time, though within sight of the beautiful Thousand Islands, which are seen still better at Gananoque. The Rideau river is crossed at Kingston, the night stop.

Kingston is a quaint, attractive city and will reward amply a few hours' sight-seeing. The fine business blocks and public buildings offer a pleasing contrast to the old forts and other evidences of early occupation. Among the interesting places to visit are Fort Henry, the Royal Military College (Canada's West Point), Queen's University and St. George's Cathedral.

The sixth day's route skirts the north shore of Lake Ontario all the way into Toronto. Many splendid views of this immense inland lake are afforded, as the road follows the shore line for many miles. None of the towns en route are large, but offer sufficient opportunity to study the people and furnish a safe source of fuel supply at all times.

Toronto is a beautiful modern city, rich in architectural attractions and containing many eminent institutions of learning. Its extensive parks, broad avenues and pleasant environs make it exceedingly interesting to tourists. Located on the lake for some distance on either side of the city are numerous summer resorts, and Toronto is the centre from which these may be reached. If visited in the first week of September, the annual fair is worthy of a couple of days' stop.



The seventh day ends at Niagara Falls, one of the greatest wonders of the American continent. The tip of Lake Ontario is rounded at Hamilton, and from that point the roaring of the mighty cataract begins to penetrate above the humming of the motor. The approach to the falls from the Canadian side is perhaps a little less beautiful than from the American, still, there is so much that is grand and awe inspiring concerning the spectacle that comparisons seem out of place.

The customs regulations will have to be arranged at the Falls. Naturally, the tourist will desire some little time for exploration, and fortunately, the roads throughout the day's trip are such that the whole afternoon ought easily to be available. The trip to Queenstown Heights and Brock's monument is advised, especially. The short 20-mile drive to Buffalo can be made comfortably in the cool of the evening.

Buffalo may be considered the gateway to the immense touring country from the West. Similarly, it might be added, that the tourist could so plan an extension of his vacation to include portions of the Middle West before returning to New York City. Vacation Tour No. 3 touches this point, the outline for both being identical from Niagara Falls to Buffalo. If preferred, the other route may be followed to New York, by the way of Washington, D. C. This route contemplates, however, that the tourist will have only about 10 days at his disposal and the eighth day crosses western New York to Elmira.

Delightful scenery marks the entire way. Several hills are encountered, though nothing like the mountains of western New England which were crossed earlier on the tour. Silver Springs is near Silver lake, practically the most western of the chain of central New York lakes. Here the scenery is particularly delightful, and gives a foretaste of what is to be seen further to the east.

Portage has a history dating back to Indian days. The settlement was so named because of the fact that the Indians were compelled to carry their canoes around the falls of the Genesee river. At this point the river makes three separate falls, at some little distance apart, and offers a pleasing sight. A splendid railroad bridge

Niagara Falls, as Seen from the Canadian Side.

Digitized by Google

now replaces the portage at a considerable height, giving a view of all three.

Dansville is in the centre of the hop growing country, and for miles the fields appear on either side of the road. A little later the tour enters the grape country, in the valley of the Canisteo river, and during the remainder of the distance into Elmira luscious fruit tempts the tourist on every hand. Incidentally, this country is somewhat noted for its wine cellars.

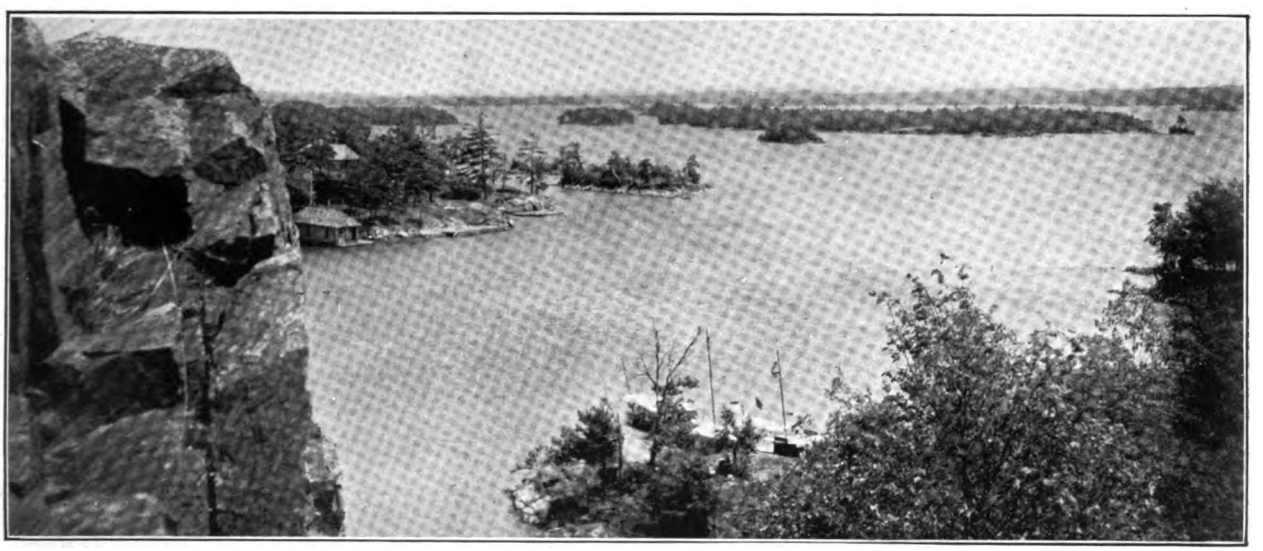
Beyond Bath is Corning, with its cut glass factories. Then comes an excellent macadam road, along the Chemung river into Elmira. This night stop first became a permanent settlement in 1788, and was incorporated as the village of Newton in 1815. The name was changed to Elmira in 1828. It is now the seat of Elmira College and other institutions of learning. Perhaps it is best known as the site of the state reformatory. Its chief industries are rolling mills, railroad car shops, steel bridge works, etc.

For the first 20 miles of the ninth day, the tour lies along the Pennsylvania line, before it finally crosses it at Athens. From this point, mountains begin to make their appearance. The route is along the Susquehanna river and affords some excellent scenery all of the way.

The Lehigh Valley railroad here winds its way among the peaks in a manner almost miraculous, and adds its share to the general picturesqueness. Perhaps the view is at its best at Tunkhannock, but the tourist will find sufficient cause for rejoicing all of the way.

The night stop is at Wilkesbarre, located in the Wyoming valley. This is the shipping point for the rich and extensive anthracite coal beds of this valley. Other industries include lace factories, silk mills, automobiles and parts, adding machines, locomotive works and cutlery shops. It was founded in 1769, and occupies a commanding position in upper Pennsylvania.

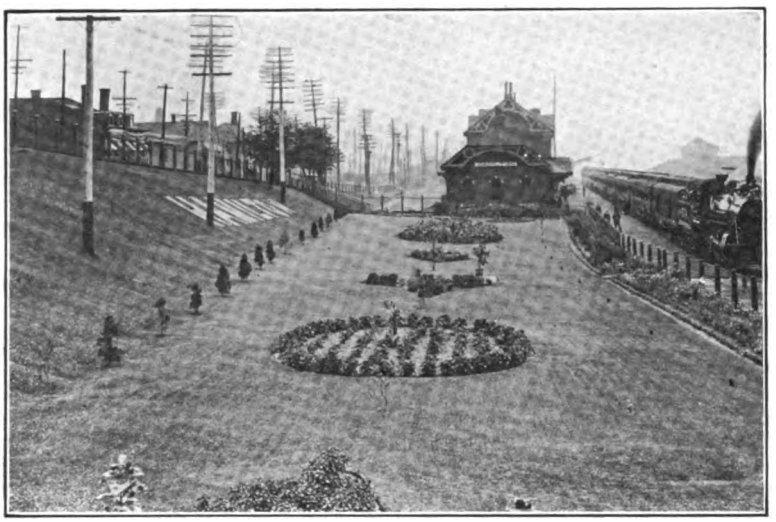
More mountains are encountered the 10th day. At Fairview the route leaves the railroad and passes Crystal lake on the way to Glen Summit springs and Bear Creek. The view still continues to hold the attention past Pocono lake and Naomi Plains to Mt. Pocono, one of the most interesting summer resorts in eastern Pennsylvania.



One of the groups which go to make up the Blue Ridge, the Poconos share with the Catskills and the mountains of West Virginia and North Carolina, an average altitude of 2000 feet, with heavily wooded slopes, through which brightly rushing streams leap from crag to crag. While much of this section is wild and uninhabited, many camps and hotels are to be found here and there.

At Stroudsburg, the tour enters the world famed Delaware Water Gap, although the gap itself is practically four miles distant. At Marshall's falls the waters of Marshall's creek plunge 100 feet downward into Sylva lake. Beyond is Oak Grove where there is a pleasing combination of mountain run and the placid Lily lake.

At Delaware Water Gap, the Delaware river flows between two high mountains. That on the Pennsylvania side is named Minsi, but that on the Jersey shore bears the more commanding cognomen of Tammany, although it goes without saying that such has not always been the case. The tops of these peaks are each over 1600 feet from the bed of the river.



On this tour, the Delaware river is crossed at Meyers Ferry, where an old-fashioned flat boat attached to a cable performs the needed service. At Hackettstown, the Musconetcong river is crossed, and very soon the tourist finds himself climbing Schooleys mountain, a former well known summer resort, commanding an excellent view of the Musconetcong and German river valleys. The remainder of the distance, beyond Morristown, is over fine new macadam, and New York City is reached by way of Weehawken.

It is anticipated that tourists will welcome the opportunity to visit Jersey points this year without being compelled to take out a special license, and in consequence the last portion of this itinerary will provide new touring ground.

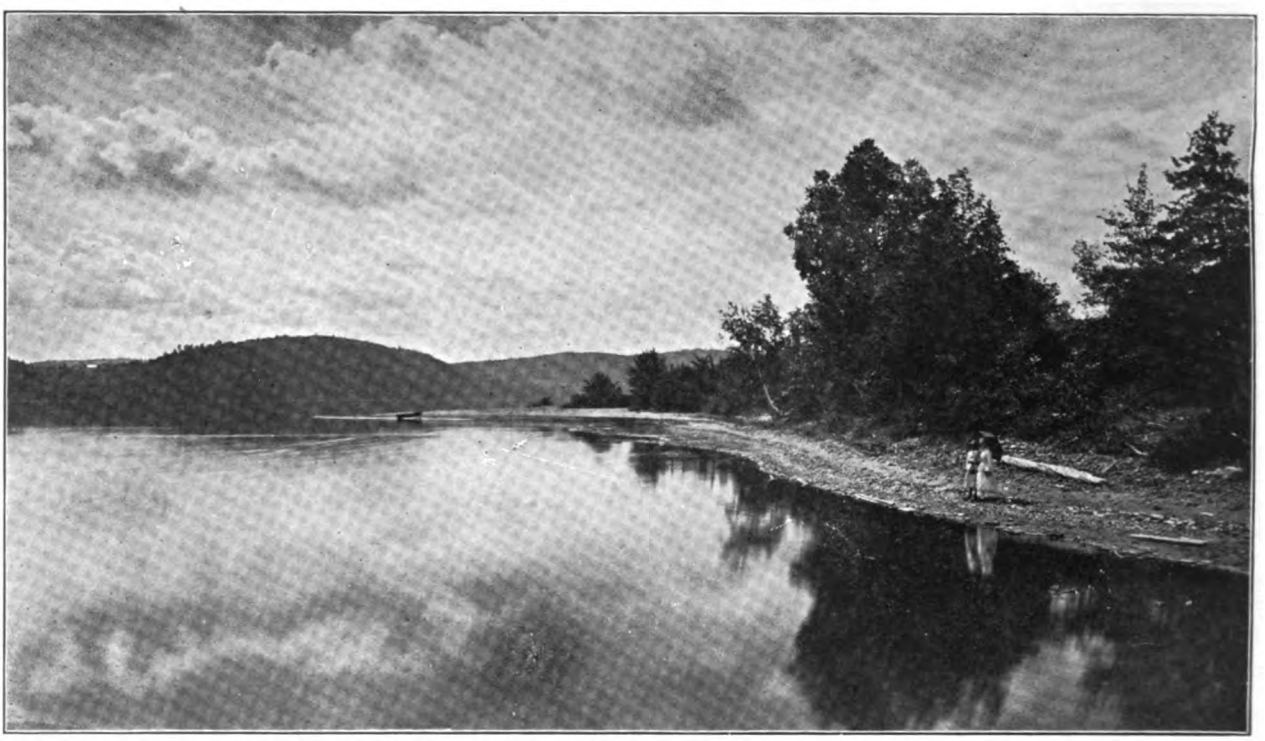
VACATION TOUR NO. 3 ENCIRCLES ATLANTIC STATES.

Ten days are also devoted to Vacation Tour No. 3, which, like the others, begins in New York City. The first day is spent in the Catskills and along the Hudson river; the second and third in the Adirondack region; the fourth about the Thousand Islands; the fifth at Niagara Falls and in western New York; the sixth among the Alleghenies; the seventh in Maryland; the eighth in Virginia; the ninth from Washington to Philadelphia, and the 10th in New Jersey.

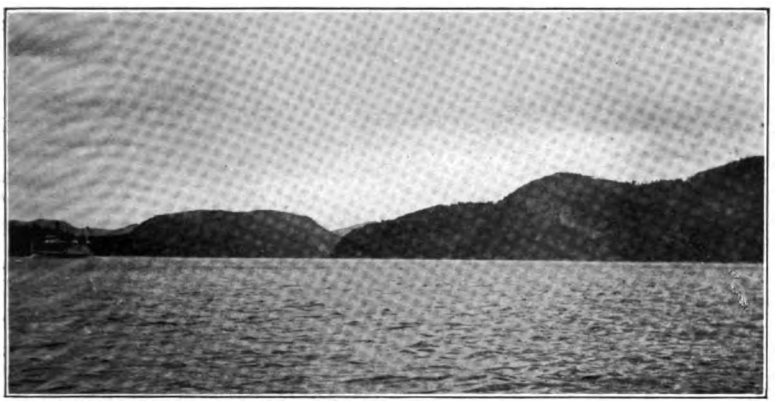
Leaving New York the first day, the route lies along the east bank of the Hudson to Tarrytown, passing through Yonkers on the way. Tarrytown has many revolutionary relics, but undoubtedly is best known as the home of John D. Rockefeller. The ferry across the Hudson is at Tappan Zee, the widest point of the river, and the first city on the opposite bank is Nyack, near which is Rockland lake, a picturesque sheet of water.



Suffern, N. Y., is a small village, but its location among the Suffern hills, on the border line between New York and New Jersey, makes it of considerable importance to automobile tourists. Good roads verge from this point in nearly every direction. Tuxedo Park, the entrance to which is passed on the way to Tuxedo, is a private preserve surrounding Tuxedo lake.

Newburgh is one of the most historic cities of the Hudson valley, and is perhaps best known as the headquarters of Gen. Washington in 1783. The house occupied by him is now a museum of Revolutionary relics. At New Platz, connections may be made for Lakes Mohonk and Minnewaska, two beautiful sheets of water in the Shawangunk mountains.

Kingston is at the foot of the Catskills, and from this point some hill climbing is in order, although the route skirts the river at the base of the mountains themselves. Some excellent views, both of the mountains and the famed Hudson river, are obtained throughout the remainder of the drive into Albany, the night stop. The handsome State House, recently damaged by fire, has an added interest.



The route the second day is still along the Hudson for a time. Just north of Cohoes are the Falls of the Mohawk, which offer a pleasing sight, and from this point to Saratoga the road lies away from the river. While Saratoga Springs is not the resort it once was, the mineral springs have lost none of their interest. There are still many handsome buildings, and the city is by no means deserted. A short distance further along is Glens Falls, intimately associated with recollections of Uncas, the last of the Mohicans, so graphically portrayed in Cooper's romance. It was also the scene of a decisive battle between the French and English in 1755.

For years, Lake George has

Beautiful Schroon Lake in the Foothills of the Adirondacks and Surrounded by New York's Historic Ground.

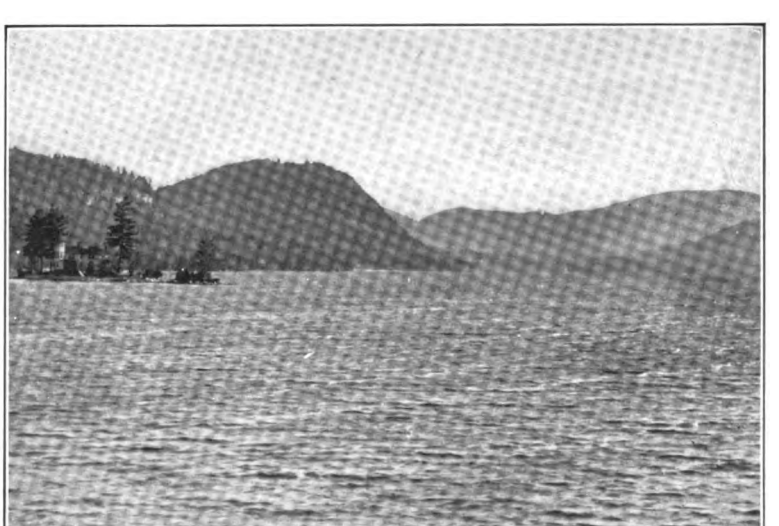
Digitized by Google

Brant Lake Vies with the Mountains in Tempting the Tourist.

been a favored resort by those who love the beautiful in nature. The lake itself is 35 miles long and in some places four miles wide. The hills and vales of the neighborhood, as well as the waters themselves, witnessed many fierce engagements during the French and Indian, and Revolutionary wars. A few miles distant is Loon lake, one of several by that name in this region, although not so well known as that other in the extreme northern part of the state.

Schroon lake is indeed a pretty sheet of water, 10 miles long and at an elevation of 807 feet. The whole is encompassed by a number of interesting hills. The valley of the Schroon river is next followed until the low divide is crossed, and the route then lies along the Pleasant valley to Elizabethtown. The way becomes rough and more mountainous at this point, albeit the views are among the best of the entire Adirondack region.

Considerable road work has been accomplished in the Keene valley during the past year and the motorists should have little difficulty in making Lake Placid for the night stop. On the way he will pass the picturesque Cascade lakes, two in number, concerning which it may be said that the beauty of the scenery about them is unsurpassed.



Lake Placid is perhaps the best known of all the Adirondack resorts, and is surrounded by high mountains. At the northern end the scenery becomes bold and imposing. Hoary old Mt. Whiteface raises its head 4780 feet, high above the rest, cleaving the clouds in solitary grandeur. All of the Adirondack's gaunt peaks are in sight, the distant ones being veiled in an exquisite violet hue. Rivers winding in and out among the green forests look like ribbons of silver, while amidst it all lies the peaceful Lake Placid, and separated from it by only a wooded eminence, Mirror lake.

The third day, finds the tourist approaching Lake Saranac. This region lies within the heart of the Clinton range, the highest and most impressive of the entire chain. The route leaves this beautiful region, to find another soon after reaching Malone, very near to the Canada line. Crossing the Raquette river near Massena Springs, and the St. Lawrence Power Company's canal at Massena, the shores of the St. Lawrence river are gained nearly opposite the Rapids du Plats. Here the dark swirling waters make a beautiful sight as they dash and tumble over each other in their haste. Further along are the Galops, a little less violent, but still sufficiently turbulent to afford abundant interest while the tourist is approaching Ogdensburg.

This is a pretty little city, located at the confluence of the Oswegatchie and the St. Lawrence, the former of which affords abundant power for various manufacturing establishments. It is known as the Maple City, because of the magnificent maple trees which line the principal streets. Connection may be made by ferry with Prescott, Ont., on Vacation Tour No. 2, which may be traversed in either direction.

A steamer runs between this point and the Thousand Islands, which are seen at their best at Alexandria Bay, the night stop. If possible the tourist should arrange to stop over for a whole day at this point, as there is so much of interest that it cannot well be covered even in much longer time. A steamer ride among the islands gives some idea of the distinctive beauties of the region, but subsequent trips to other islands will indicate that each has features which are possessed by none of the others, giving it a charm peculiar to itself.

If preferred, the tourist may continue the journey over Vacation Tour No. 2, connecting at Kingston, Ont., after a sail around the islands. This tour turns inland for a short run across country to Watertown, one of the principal western gateways to the Adirondack region. Thence, the

Anthony's Nose and Rogers' Rock on the Banks of Lake George, N. Y.

Digitized by Google

southern shore of Lake Ontario is skirted through Oswego to Rochester, the night stop. Some excellent lake views are witnessed during the day's run.

Rochester is one of the most important industrial centres in the Empire State. The Genesee river makes three distinct falls within the city limits, affording a large and valuable water power. Among the points of interest are the plant of the Eastman Kodak Company; the aqueduct, 850 feet long, by which the Erie canal is carried over the river, and the statue of Frederick Douglass, the famous negro statesman.

Continuing along the south shore of Lake Ontario, the fifth day, the tourist reaches Niagara Falls. The scene from the American side is held by many to be far superior to that offered from the Canadian shore. To those for whom this is the first visit, it undoubtedly would be wise to make this a night stop, or at least so arrange matters that some little time may be devoted to exploring the many wonders here presented. Much has been written about the Falls, and it is only necessary to recall the Cave of the Winds, the Burning Spring, the Whirlpool Rapids and the famous Gorge of the Niagara as indicating the possibilities for extended exploration.

Buffalo, the sixth city in the world in commercial importance, offers many pleasing drives, and its many parks make up a pretty combination for the sightseer, the recently completed McKinley monument being of particular interest. The route skirts Lake Erie to Westfield, and is that taken by most transcontinental parties, passing through to Chicago. Those who desire may continue the journey to the West by connecting with Transcontinental Tour A at this point. At Westfield, also, the tour intersects the old Portage road constructed by the French in 1763.

Here, the way turns inland to Mayville, on Lake Chautauqua, one of the most remarkable sheets of water in western New York. The lake is nearly 20 miles long, and although but seven miles from Lake Erie, is 700 feet above its level and its waters flow into the far-away Gulf of Mexico.

Several well known resorts are located on this lake, but perhaps the best known is that of Chautauqua, the night stop. This is the home of the world renowned Chautauqua literary and scientific circle, where summer after summer, students from all over the world assemble, in the midst of surroundings which cannot help but stimulate, and pursue their studies of the languages and scientific subjects.

Jamestown, at the eastern extremity of the lake is the first important city of the next day's run. A short distance away is Celoron, which resembles very much a seacoast resort. Excellent opportunity is offered for fresh water bathing, boating and fishing. All the various resorts on the lake are connected by steamboats.

At Warren, Penn., the route enters the oil fields. Warren is located at the intersection of the Allegheny and Conewango rivers and is an important railroad centre. Between Warren and Butler the tourist will find plenty of interest in studying the oil wells, while some excellent views of the Alleghenies are also obtained.

Pittsburg is best known as the Smoky City, and is famous for its steel works. It was settled in 1753 by the French, who built a line of forts along the Ohio and Allegheny rivers, that at this point being named Fort Duquesne. This was destroyed in 1758, and later was succeeded by Fort Pitt. The history of Pittsburg, as such, dates from 1765. Its commercial advantage is gained through the fact that it is in the centre of the richest coal district in the world.

Thousand Islands, as Seen from Alexandria Bay, One of the Prettiest Playgrounds in Northern New York.

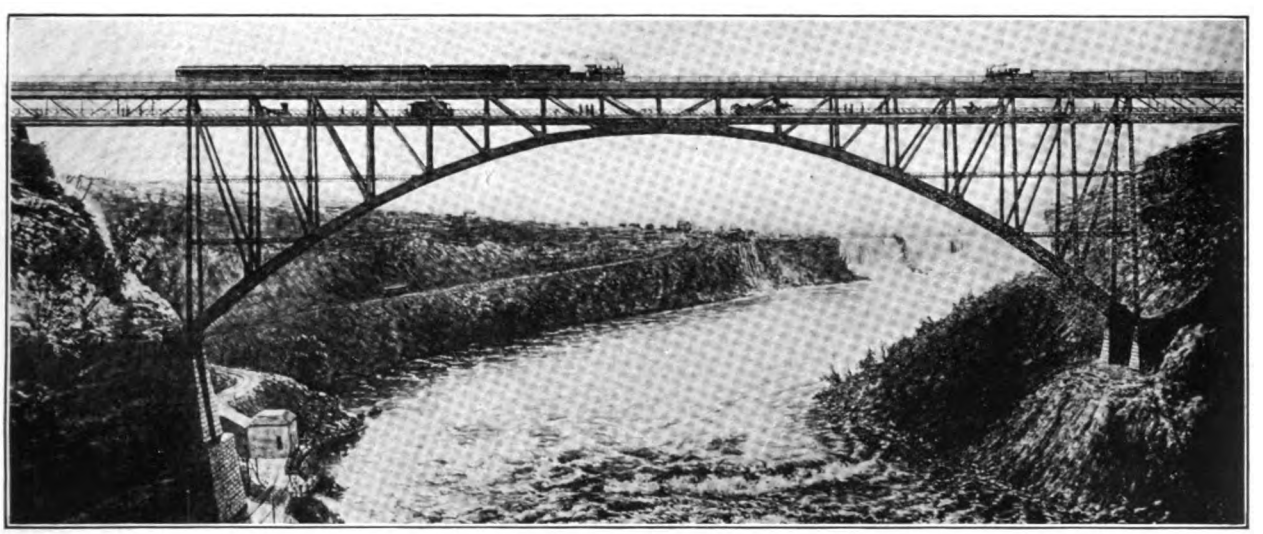
Across the river is Allegheny, formerly a separate municipality, but incorporated with Pittsburg in 1897. Here may be seen Phipps Conservatory, ranking among the finest in America; the Carnegie Institute, and the Carnegie Library. In Pittsburg, itself, is located the Allegheny County Courthouse, the main tower of which is 420 feet high and commands a splendid view of the valley.

Leaving Pittsburg the route passes through Carnegie, the site of the Homestead mills, and Canonsburg into Washington, the home of Washington and Jefferson

Digitized by Google

College. The road is somewhat hilly and bumpy, but connection is made at this point with the national highway, which, while it has not been kept in very good condition, has been replaced in spots with macadam. In places the ascents and descents are very steep.

At Scenery Hill is an old tavern built in 1794. At Brownsville, the highway forms a horseshoe curve, one end being at the bridge over the Monongahela river and the other at the summit of a hill. The grades are not bad until Uniontown is reached, but beyond that point there is one steep ascent for nearly three miles. A little further along the old Braddock road, cut through by Washington, is followed into Grantsville. Washington is said to have camped at the foot of Mt. Washington, near Farmington. The old earthworks of Fort Necessity are still discernible, and Braddock's grave is in a small enclosure near the roadway.



Beyond Farmington, the road goes over Briery mountain. The Youghiogheny river is crossed at Somerfield. Shortly after passing Addison, the West Virginia state line is crossed, and then comes a climb to the top of Negro mountain, 2906 feet above sea level. Little and Big Savage mountains are descended into Grantsville, Md. Near the foot of Mt. Warrior is an old Indian trail, followed by Gist on his trip of exploration for the Ohio Company. From Frostburg to Cumberland, is a fine stretch of macadam to end the day's drive.

Cumberland was the centre in the military operations during the Civil War, and is now a manufacturing city of the upper Potomac. Nearby are the Wills, Dans and Knoby mountains, and the deep gorge of the Narrows. The national road continues to Hagerstown, still more noted in Civil War history.

The eighth day the route leaves Cumberland toward the south, again entering West Virginia for a time. Leaving the Potomac valley, the road ascends more of the Alleghenies, of which some excellent views repay for the hard climbing, and descends into the Shenandoah valley to Winchester, Va. Soon afterward, the climbing begins once more, for it is necessary to cross the Blue Ridge before regaining the Potomac and the final dash into Washington. At Berryville, connection may be made for Harper's Ferry.

Washington offers much for the tourist. Aside from being the capital of the nation, and as such the public buildings are of more than ordinary interest, it is the centre of a historical country with which every American is more or less familiar. If possible to spend a day in pleasant rambles about the city and to some of the historical spots nearby, the tourist will be well repaid. By all means, he should find time to visit Alexandria, Va., a drive of only 10 miles.

Mt. Vernon, the handsome estate of Gen. Washington, is still further away, and the roads leading thereto are decidedly poor. In Alexandria, however, are to be found numerous memories of the "Father of His Country." Chief among these may be mentioned: Christ Church, in which his pew remains as when occupied by him; engine house of the old Friendship Fire Company, organized in 1774, of which he was a member; the old City Hotel, from the steps of which he delivered his farewell address; the Masonic lodge room, where he presided as worshipful master; the Carlyle House, built in 1752, where he received his first command, and numerous other places of interest associated with other historic figures. The return trip to Washington may be made via Arlington and the national cemetery with profit.

Gorge of Niagara River and Grand Trunk Railway Bridge, With Falls in the Distance.

The route of the ninth day is over the main trunk line from Washington to Philadelphia, passing through Baltimore, Md., and Wilmington, Del. Good macadam marks a major portion of the way. Baltimore is one of the chief oyster packing centres of the world. It is a manufacturing city of importance, and has a number of fine public buildings. Druid Park, a 700-acre plot with varied native forests, is beautifully laid out and contains a number of fine drives.

Between Havre de Grace and Newark, Del., road improvement is going on and a detour may be necessary. In any event, the old road was very bad in all conditions of weather, and the new way will

Digitized by Google

Colonnade and Pergola at Point Chautauqua, N. Y.

be much appreciated by tourists over this line. At Havre de Grace, the Susquehanna river is a full mile wide. At Perryville the road crosses a long railroad span, which has been transformed into a highway bridge.

Wilmington is noted for its parks, one of which is located in the Glen of the Brandywine, a name which is familiar to students of the Revolution, and another is Rockford Park, where a handsome statue of Thomas F. Bayard is to be seen. Here also is to be found the famous Dupont powder works. The old Swedes Church was built in 1698.

Philadelphia is an important touring centre, many of the interesting places in both Pennsylvania and New Jersey being reached from this point. It has numerous historic places, including, of course, Independence Hall. Fairmount Park, with its miles of excellent roadways, is the scene of the annual Fairmount Park road race for automobiles. One of the features of interest is the United States Mint.

Crossing the state of New Jersey, from Camden, to within 10 miles of the Atlantic ocean, the tour reaches Lakewood, among the pines. The booming of the surf can be heard faintly above the murmuring of the wind in the pines, and the air is all that could be wished. The superb polo grounds of Georgian Court, by courtesy of George Gould, are open to visitors, with very slight restrictions. Here also is Lake Carasaljo, named, as the guide will explain, by the father of three daughters, who combined the first syllables of their names into a harmonious designation for the lake.

From Lakewood the route turns northward, visiting a number of seashore resorts, before reaching Asbury Park and Long Branch, two names inseparable with the history of watering places in America. The return to New York is along the Jersey coast for the entire distance, crossing to Staten Island, and entering the big city by way of the Manhattan ferry.

TOUR NO. 11.

Tour No. 11 has Boston for its starting point, and is suggested to cover three days, with night stops at Keene and Plymouth, N. H. It is so laid out as to connect with Tour No. 15 at Keene, by reversing which to Brattleboro, Vt., Vacation Tour No. 1 may be followed, giving opportunity for extending the vacation to at least seven days. By reversing Tour No. 21, from Brattleboro to Manchester, Vt., connection is made with Vacation Tour No. 2, opening up still other possibilities. Other combinations will be suggested herewith, and still others will suggest themselves.

Leaving Boston by way of Cambridge, Arlington and Lexington, the motorist follows closely the road covered by Paul Revere on his famous midnight ride. At numerous points on the way monuments have been erected setting forth the progress of that trip as well as other interesting historical data connected with the Revolutionary period. In Lexing-

The White House, Official Home of the President of the United States.

Digitized by Google

ton and Concord, there is much to stir the patriotism of the tourist.

Groton was visited in 1646 by Sachem Monoco at the head of 400 Indians, and the town was burned, with the exception of four garrison houses, in which the people successfully defended themselves. Monoco boasted that he was on his way to Concord and Lexington to reduce these towns, and later would march upon Boston. The following year saw him in Boston, but with a rope around his neck, marching toward the Common, where he was hanged.

The reverse of Tour No. 23 is met at Ashby and followed into Keene, N. H., through the pretty little New Hampshire towns of East and West Rindge, East Jaffrey, Jaffrey and Marlboro. In the northwestern part of Jaffrey is Monadnock mountain, with its high and rugged top rising 3186 feet above the sea. In this town, also, may be seen the ancient church, now secularized, which was erected on the day of the battle of Bunker Hill. Workmen thereon are said to have heard the cannonading. Numerous drives about the lakes in this region are worth taking, if time be available.

Keene is a pleasant city in the valley of the Ashuelot river. Its original name was Upper Ashuelot, and signified "the collection of many waters." Two miles north of the city are the Beaver Brook falls, where the brook flows over a stair-like succession of ledges 40 feet into a deep pool, the haunt of large trout. Lake Spofford is also nearby.

The second day finds the tourist approaching Lake Sunapee, 1104 feet above sea level, and nestling among the hills of Sullivan and Merrimac counties. The lake is about 10 miles long, indented with enticing bays and coves, and ranges from one-half to three miles in width. A short distance from its shores is the majestic Mt. Sunapee, which adds not a little to beauties of the scenery. Connections may be made here with Tour No. 16, rejoining this tour at Concord, or returning to Boston by way of Portsmouth.

Skirting this body of water by way of Newport, Guild, Sunapee and New London, the route lies toward the White mountains, with ever changing glimpses of the peaks in the distance. Entering the Pemigewasset valley, and passing Bristol, two miles further along, is Newfound lake, with Sugar Loaf mountain on the west shore and Crosby mountain on the east.

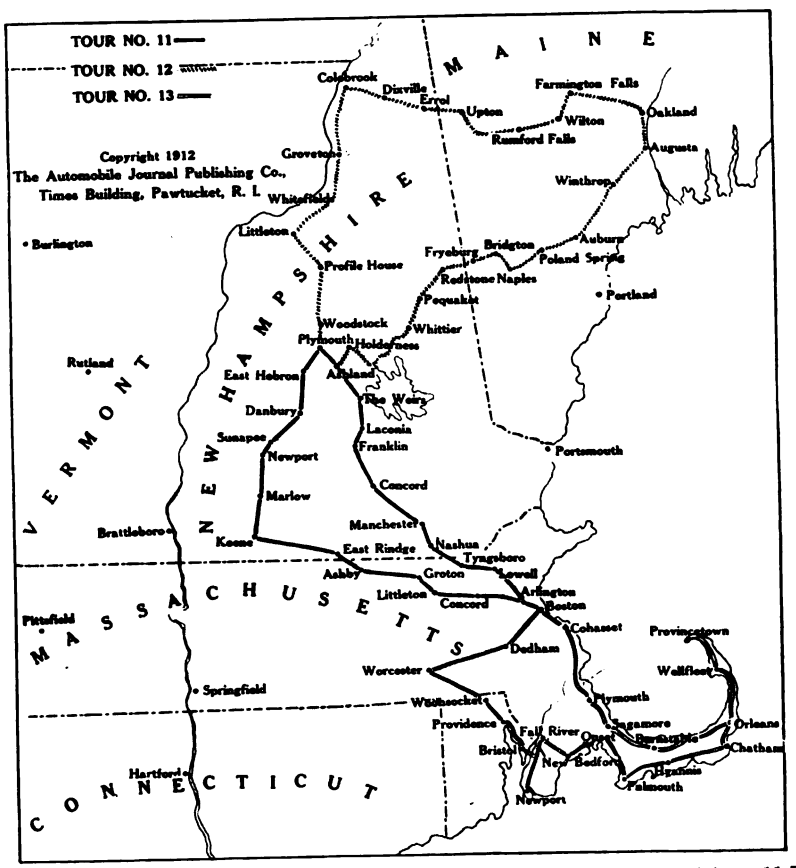
Plymouth, the night stop, is within easy view of the Franconia and White mountains to the north. Mt. Prospect, 2072 feet high, is a little to the northeast. It possesses a number of interesting features, notably the Miser's cave, the Avalanche, the Cold and the Boiling springs. Oscela and White Face are toward the northeast, and just below Squam range to the east, is Squam lake, island dotted and very pretty. This is only a partial list of the lake and mountains to be seen from Plymouth, most of which are located within a few miles' drive.

Connection may be made here with Tour No. 12, which may be followed in the reverse direction to Vacation Tour No. 1 and the Bretton Woods, or as planned, reaching the White mountain region at Conway and visiting the Maine woods, returning to Boston by way of Portland.

The third day visits Meredith on the way to Lake Winnipesaukee and The Weirs. Near the latter, on the banks of the lake is Endicott rock, which is about 20 feet around, and on which are carved the initials of the chiefs of the Colonial survey of 1652, and with the words, "John Endicut, Gov." The waters of the lake reflect the shadows of several bold mountains and surround nearly 300 islands, large and small.

The Weirs is best known as a summering place, but at this point is located a large flood gate, so arranged that the flow of the waters from the lake into the Merrimac river, is controlled for manufacturing purposes throughout the entire Merrimac valley to Newburyport, Mass. The return to Boston is through this valley as far as Lowell.

Franklin was the birthplace of Daniel Webster. Concord is the capital of the state, and an abundance of shade trees gives it a pleasant embowered appearance. A



Lake Sunapee, N. H., in the Midst of Romantic Scenery and the Home of Gamy Bass.

Digitized by Google

splendid view may be obtained from the dome of the State House, and a number of the public buildings are worthy of attention.

At Manchester, the Amoskeag Falls on the Merrimac river have a descent of 47 feet, with rapids above, and afford a fine sight. A short distance from this city is Lake Massabesic, which has 31 miles of shore with some beaches of remarkably white sand. The Fairy Cave and a curious sulphur cave, Devil's Den, are often visited by tourists, while in this vicinity.

Nashua is the last New Hampshire town to be visited, and at this point connection may be made with Tour No. 15 for Lawrence and Salem, if it is preferred to return to Boston by that route. The Pawtucket falls at Lowell, were a favorite fishing grounds of the Indians. The Pawtucket canal extends from the head of the falls to the Concord river, below the city, and affords excellent water power, having a fall of 30 feet.

The outward route is rejoined at Arlington, after passing through Billerica and Burlington, although there are numerous methods of reaching the centre of the city from this point, practically all of them over excellent macadam roads.

TOUR NO. 12.

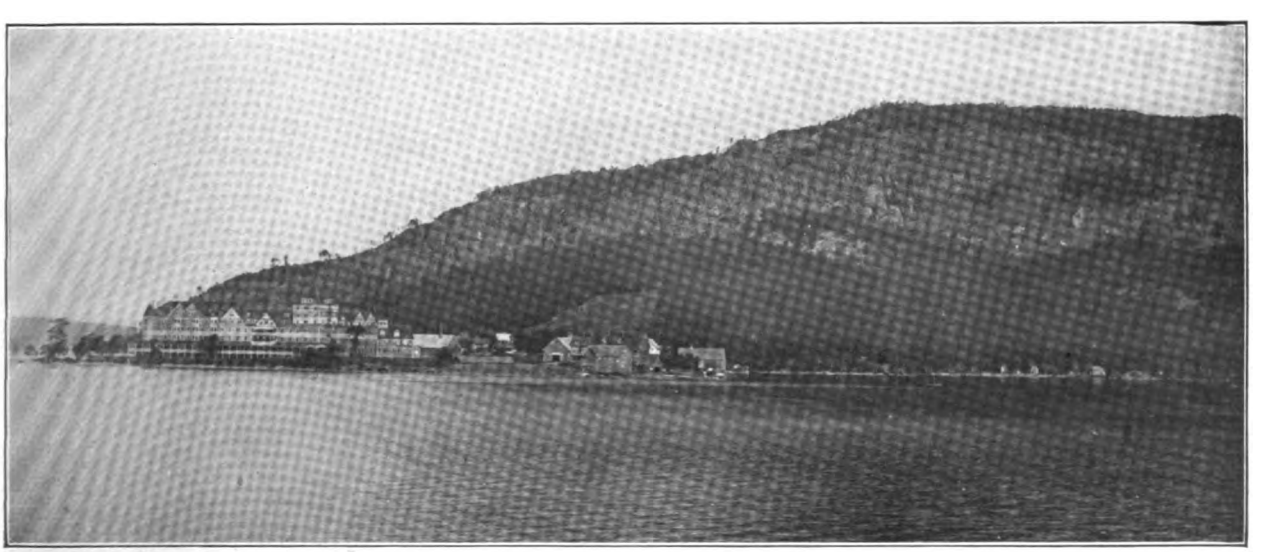
Tour No. 12 is planned to start from Augusta, Me., and visits the White mountains. It is suggested as another three-day vacation, but can be continued indefinitely, by combination with other tours at various points on the way. The night stops are at Dixville Notch and Center Harbor, N. H. While it is possible to go direct to Boston, Mass., for instance, by reversing Tour No. 31 to Portland, continuing Vacation Tour No. 1 from that point, a very pleasing alternative may be obtained by joining Tour No. 11 at Plymouth, N. H. The entire journey from Augusta to Boston by both of these outlines used in combination could be made to occupy not more than five days, if desired, and would afford a fine vacation.

Leaving Augusta on the first day, the tour visits the Belgrade

Digitized by Google

View in the Flume at Dixville Notch in New Hampshire.

lakes, without doubt the finest bass fishing grounds in the country. The water of the lakes is very clear and the bottom decidedly rocky, making an ideal haunt for bass. The shores of both lakes are well wooded and some excellent views are to be obtained along the roads skirting their edges.



At Farmington, connection may be had with Tour No. 31, returning from Moosehead lake to Rangeley lakes. This tour crosses Tour No. 31 again at Dixfield and joins Vacation Tour No. 1 at Rumford Point. The way then leads into the Maine woods in the vicinity of the Rangeley lakes, through Hanover, Newry, Grafton Notch and Upton, into New Hampshire at Errol. On the way several lakes are passed, included among which are: Mollychunkamunk, Allegundabagog, Welocksebacook and Umbagog, the latter at Upton.

At Errol, the tourist finds himself in the heart of the White mountains. On every side, there are to be found signs of nature's handiwork on the way to Dixville Notch. Among these may be mentioned Table Rock, reached from the road by a rude stairway of stone blocks known as Jacob's Ladder. The view is very extensive from this point, and amply repays for the strenuous climb. The rock is 561 feet above the road, 2450 above the sea and is a narrow pinnacle only about eight feet wide at the top, with sharp, precipitous sides.

The notch itself, has high columnar sides, frowning at each other across the narrow chasm. These cliffs of decaying mica slate present a scene of ruin, transition and shattered strength, that is mournful and almost repulsive. The Notch is not a mountain pass, but a wonderful ravine among high hills. It has its flume, its cascades, its profiles, its snow cave, and its cold springs of the purest water known to science. Altogether it is a sight not to be missed, and well worth the climbing to which the car is subjected in reaching it.

The second day, the tourist again passes through this two miles of palisades on his way to Colebrook, where a detour may be made to Connecticut lake, at the head of the Connecticut river, down the valley which he will drive through for a time. At Littleton, connection may be made with Vacation Tour No. 1, which may be taken in either direction.

This tour now enters the Franconia range, scarcely less grand than that which was left behind so recently, and divided from it by the Twin mountain and Field Willing ranges. The Franconia region has two great natural wonders, either of which would make any other section famous. Twelve

Canoeists Enjoying One of the Lakes in Central Maine.

hundred feet above the lake, starting out from the blue crest of the mountain, stands a sculptured likeness of a giant Titan; the profile of the Old Man of the Mountain. The Flume, located some miles below, is a rock fissure 700 feet long and 60 deep, with fern decked granite walls from 10 to 20 feet apart; in reality a miniature canyon.

Continuing to Plymouth, where connection may be made with Tour No. 11 for Boston, or Tour No. 12 for Rutland, Vt., at which point Vacation Tour No. 2 may be followed either way, this tour turns eastward to Center Harbor, on Lake Winnipesaukee, for the night stop. The next morning, the journey will take the tourist up the eastern side of the White mountains, affording still more wonderful views.

At Conway, the route crosses Tour No. 16 from Portsmouth, N. H., and re-enters Maine at Fryeburg. A little later it visits the region of Lake Sebago and crosses Tour No. 31 at Poland Spring. Auburn and Lewiston, separated only by the Androscoggin river, are the last cities of importance passed on the way to Augusta. Lewiston falls, where the river breaks over a ledge of blackened gneiss, is worthy of note at this point. Lewiston is also the seat of Bates College, with its commodious buildings.

Near Winthrop is Lake Maranocook, the chief picnic ground of central Maine, It is a lovely winding lake, nine miles long, and about one mile wide, dotted with picturesque islands. West of the village is Mt. Pisgah, from which views of the White mountains are obtained.

At Augusta is located the recently rebuilt Capitol, and also the State Hospital for the Insane.

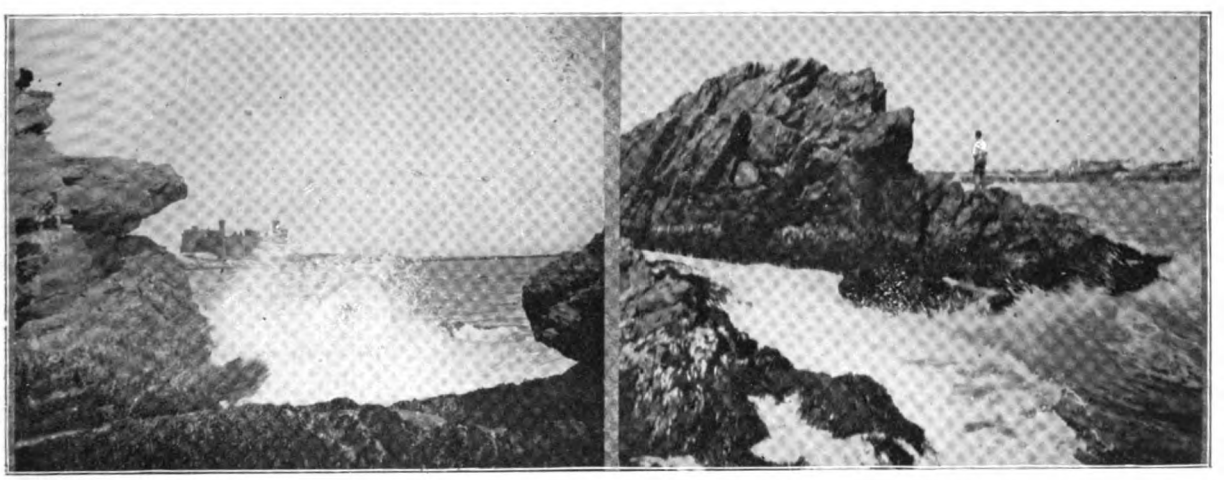
TOUR NO. 13.



Tour No. 13 offers a decided change from those heretofore outlined. Like them it is planned to occupy three days, and is so arranged that it may be utilized in combination with any of the others presented herewith. It starts from Boston, and Provincetown, Mass., and Newport, R. I., are the night stops. The tourist returning from the Maine woods by Vacation Tour No. 1 may enter upon this tour at Boston, rejoining his original schedule at Narragansett Pier, R. I., by ferrying across the lower end of Narragansett bay from Newport. It will add at least two days more to the trip, but it will be found to be time very well spent.

The route lies along the south shore from Boston, through Quincy, Hingham, Cohasset and Kingston, all filled with summer homes of Boston people, to historic Plymouth. In fact the entire trip during the first day from this point is over historic ground. At Plymouth, the tourist will wish to see Forefathers Rock, on which it is said that the Pilgrims first set foot in making their landing in America; Burying Hill, with its graves of Miles Standish, John and Priscilla Alden, and others only a little less known; Pilgrim Hall, with its museum of Pilgrim relics; the plot of ground where the dead were buried during that first winter, and their graves sown with grain the next spring to keep the Indians in ignorance of their death, and many other noted scenes. The sites of interest to the tourist are clearly marked, and it is possible to determine with a fair degree of accuracy just where each of the central figures lived and moved during those early days following closely upon 1620.

The route lies along the north shore of Cape Cod, through a number of small towns, distinctive in their original quaintness, to Provincetown, in the harbor of which the Mayflower was brought to anchor, while the members of the little band drew up their compact and signed it with their life's blood. The tourist goes over the route in the reverse direction from that in which the Mayflower sailed from Provincetown to Plymouth, but after a night on the tip end of Cape Cod he returns over a portion of the trip, before shifting to the south shore.

From Chatham to Onset, the tour visits a number of towns, which have furnished numerous sailors for America's merchant marine, as well as the navy. Cape Cod has an individuality, unlike that of any other section of the country. Connection may be made for Wood's Hole and Martha's Vineyard at West Falmouth. Buzzards Bay is well known as the summer home of the late Grover Cleveland, while President.

Fairhaven was the home of the late H. H. Rogers, and the very excellent highways of the town practically were a gift from him. For years he was superintendent of streets in Fairhaven, but many times the salary voted by the town was expended by Mr. Rogers in giving to that section permanent highways, which will serve long as a memorial to him.

Two Views of Surf from Cliff Walk at Newport, R. I.: Ochre Point at Left; Brenton Point at Right.

New Bedford and Fall River are large commercial centres in southeastern Massachusetts, the former having been for a number of years the home port of an extensive whaling fleet. The latter has an excellent harbor, and the numerous streams emptying into it afford abundant water power for numerous manufacturing enterprises.

Newport is reached by the way of Tiverton and along the island of Rhode Island. It is famed the world over for its magnificent summer homes of wealthy people. Opportunity should be taken to visit a number of these. The cliff walk, leading for several miles along the shore and through many of the estates, is also of interest. Aside from the summer

Digitized by Google

One of the Pleasant Summer Villas at Newport.

Cliff Walk Bridge on Vanderbilt Estate.

homes, Newport has much of historical value, and among these features may be mentioned the Old Stone Mill, found standing on the highest point in the city when the settlers first cleared away the underbrush, and supposed to have been erected by the Norsemen, hundreds of years before the visit of Columbus to America. The United States naval training station, navy yard and torpedo station also are located at Newport.

The third day finds the tourist skirting the east shore of Narragansett bay, after crossing from the island of Rhode Island to Bristol by ferry. From Bristol may be seen Mt. Hope, where King Philip congregated his anti-English allies for the attack upon the Narragansett fort in 1675.

Vacation Tour No. 1 is reached at Providence, over which the return to Boston may be made, if desired. This tour follows the Blackstone valley to Worcester, Mass., and re-enters Boston over one of the three main macadam routes between those two cities. Good roads are encountered practically all of the way from Providence, the beautiful Blackstone valley being ideal touring ground.

TOUR NO. 14.

Tour No. 14 leaves New London, Conn., for a three days' trip, most of which is spent in the state of Connecticut. Used in combination with Tour No. 21, it is possible to join Vacation Tour No. 2 at Great Barrington, Mass., and as it reaches the outward bound portion of Vacation Tour No. 1 at Danbury it affords abundant opportunity for Connecticut motorists to join the whole itinerary of tours presented herewith.

Leaving New London, the way leads along the Long Island sound to New Haven, at which point connection may be made with Bridgeport, forming what is termed the shore line to New York, and can be used as an alternative for Vacation Tour No. 1 from New London. Lyme is a venerable old hamlet, buried in foliage, its main street lined with old trees and historic mansions. At Saybrook Point was an old fort, built in 1635, which was destroyed in 1871 in order that the railroad might be cut through. It was in a fair state of preservation, and its long history should have deserved a more noble end. America, or at least Connecticut, had not begun to realize the importance of antiquities at that time, it would appear. The new bridge over the Connecticut river at Saybrook makes it unnecessary to utilize the ferry as it has been in previous years.

Westbrook, Clinton and Madison are pretty summer shore resorts, still untouched by the trolley and lacking the noisy amusement parks of those nearer the Elm City. Guilford was the hiding place of the regicides for a time. Between Guilford and Madison is Sachem's Head, so named because during the extermination of the Pequots, Uncas, the Mohegan sachem, pursued and shot a Pequot chief, placing his head in the fork of an oak tree, where it remained for many years. Branford bay is dotted with the Thimble islands, on which many summer homes are located.

At New Haven the buildings of Yale University are of particular interest, and if time permits, the Art School and Peabody Museum of Natural History should be visited. The shore line from this point to Bridgeport is through

Over the Litchfield Foothills Into the Housatonic Valley.

Digitized by Google

West Haven, Milford and Stratford, macadam all of the way and practically impossible to lose.

The way now leads inland, across to Derby, Shelton and Huntington, three manufacturing centres at the confluence of the Naugatuck and Housatonic rivers. At Danbury connection is made with Vacation Tour No. 1 and with Tour No. 51, the latter of which is followed for a time, into the valley of the Housatonic.

At New Preston is the prettiest of all the Litchfield county lakes, Lake Waramaug. A splendid boulevard has been constructed around this body of water and makes a pleasant side trip of 8.5 miles. At Woodville the road dips abruptly into a narrow notch between two high hills, one of which is known locally as Mt. Tom. From this point the drive is through Bantam, and along the edge of Bantam lake to Litchfield, the night stop.

It is at Litchfield that connection is made with Tour No. 21 for Great Barrington, Mass. There is much of interest in the old town, situated in the midst of the Litchfield hills, particularly the old whipping post and the Gov. Wolcott mansion. In this latter the young women of the town melted the statue of King George, which was spirited away from New York City during the Revolution, thus furnishing bullets for the Continental army.

The second day the tourist crosses the hills to the Naugatuck valley at Torrington, the largest town in the county, famed as the birthplace of John Brown, the illfated abolitionist. Winsted, at the head of the valley, is another manufacturing town, with a number of memorials to William Gilbert which are worthy special attention. Highland lake, with a well kept boulevard, is also nearby. The tour soon enters the Farmington valley, passing through Satan's Kingdom, where the river dashes over a series of rapids for some miles. Long before Farmington is reached, however, the waters have calmed down, giving very little indication of their turbulent past.

At Farmington connection is made with Tour No. 21, on its return, and Vacation Tour No. 1 is reached again at Hartford. The journey from Hartford to Worcester, Mass., is almost in a direct line, crossing the new bridge into East Hartford, and thence to Manchester, Vernon and Rockville. The latter is one of the smallest cities in the state, with an abundance of cherry trees. The water supply is furnished by Sinipsic lake among the hills back of the city.

Stafford Springs is noted for its mineral springs, particularly those containing iron in solution with carbonic acid. The Indians utilized these waters with beneficial results, and the whites have been patronizing them for over 150 years.

Worcester is the second night's stop, and from this point the tour turns southward to Putnam, Conn. Near this city is Mt. Woodstock, a miniature Mt. Holyoke, looking down upon Woodstock lake, a beautiful sheet of water. Below Danielson is Quinebaug pond, where the Narragansett's fishing light is said to rise in the form of a pillar of fire once in seven years. This old legend is firmly rooted in the minds of the dwellers of the country side, and they claim to have seen the mysterious light over the pond.

Norwich is the Rose City, pleasantly situated on the banks of the Thames, its streets and homes forming neat terraces. Nearby are the Falls of Yantic, close to the Indian cemetery, a spot chosen centuries ago as the burial place for the royal blood of the Mohegans. Many of the grand sachems of the tribe are buried here, the last to be accorded such honors being Mazeen, who died in 1826. In the centre of the ancient monuments stands a massive obelisk erected to Uncas, the foundation stone of which was laid by President Jackson.

The return to New London is down the Thames valley, a portion of the distance being along the course of the intercollegiate boat races, between Harvard and Yale.

Three Views of Historic Litchfield: Left, Wolcott Mansion; Centre, Elm Street Drive; Right, Old Whipping Post.

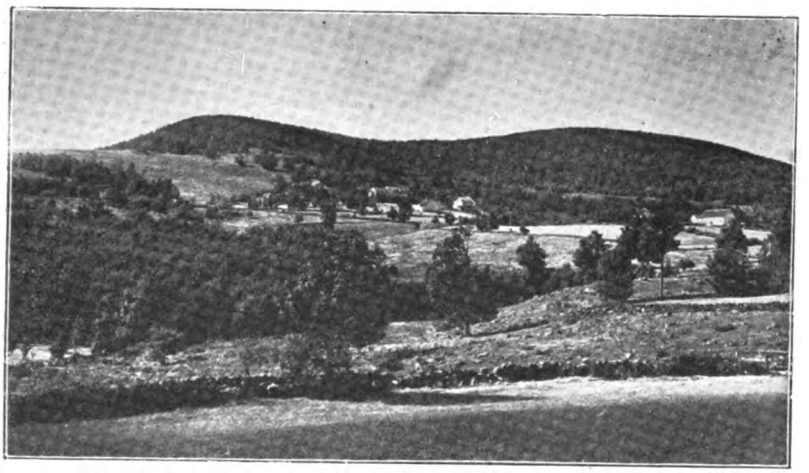
TOUR NO. 15.

Tour No. 15 starts from Worcester, Mass., with night stops at Brattleboro, Vt., and Nashua, N. H. It connects with Vacation Tour No. 1 at Greenfield, Mass., and Salem, Mass. Other connections make it possible to use this tour in combination with at least two others in a visit to the White Mountain region.

The first day's run is from Worcester across the hills of northern Massachusetts to the Connecticut river. At West Rutland is located a sanitarium for consumptives, suggesting the quality of air which greets the tourist over this portion of the journey. At Athol the Miller's river is reached and followed for some 25 miles, passing through Miller's and Turner's Falls, so named because of the pretty falls in the river which furnish power for manufacturing purposes.

At Greenfield the tour turns northward to Brattleboro, Vt., avoiding somewhat that laid out in Vacation Tour No. 1 between these two points. Brattleboro is



the night stop, and the second day's run crosses the Connecticut river to Hinsdale, N. H. Mine mountain, near Hinsdale, exhibited volcanic symptoms a few years ago, a lava-like substance having been thrown out and formed on the mountainside. On a hill near the Ashuelot river is to be seen the ruins of an ancient Indian fort.

From Keene the way leads across the southern end of New Hampshire, over ground that has not been covered by tourists until within a few years. Much interesting lake and mountain scenery rewards the visit to this region. At Milford a side trip to Mt. Vernon may be taken. From the spire of the church it is said that the sails of ships on the Atlantic can be seen. Amherst was the birthplace of Horace Greeley. The village is on a high plain and commands an excellent view of the surrounding country.

While direct connection may be made with Nashua from Amherst, the roads are much better by the way of Manchester and Merrimac in the Merrimac valley. Nashua is the night stop, and is a city of comparatively recent origin, although first settled long before the King Philip war and bravely defended during that conflict. As late as 1803 it was a sandy plain covered with pine trees. It hardly seems possible that indomitable energy has transformed this apparent waste land into the enterprising city of today.

The third day the way leads across a small portion of New Hampshire, touching Hudson and Pelham, to Lawrence, Mass. This is a manufacturing city of considerable importance, and among the

Digitized by Google

Mt. Wachusetts on the Massachusetts State Reservation.

features of interest is the new city water supply, constructed at a cost of about $1,250,000. Andover is an ancient academic town, which has been noted for its theological schools for over a century. It was purchased from the Indians in 1643 for $24.64 and a coat.

The North Shore is reached at Salem, and before turning inland again the tourist follows this shore on an excellent parkway through Marblehead, one of the quaintest old towns in New England; Swampscott, where the surf beats higher and more wildly than at any other point on the North Shore, and Lynn.

Vacation Tour No. 1 may be followed to Boston with return to Worcester over at least three different roads, all of which are of macadam. The tour connects with one of these roads by way of Waltham, home of the Waltham watch works. Marlboro was the site of the old Christian Indian village of Okommakamesitt and was settled by Sudbury people in 1655. During the first few years of its history as Marlboro, the pastor of the settlement refused to baptise children born on the Sabbath.

Worcester is reached from this point by way of Northboro and Shrewsbury, Lake Quinsigamond being passed on the way.

The summer home of the Worcester Automobile Club is located on the banks of this lake, amid fine touring country.

The Beautiful Contoocook Lake, Near East Jaffrey, N. H.

TOUR NO. 16.

Tour No. 16 is a three-day trip from Portsmouth, N. H., with night stops at Bretton Woods and Sunapee, N. H. It would be possible to curtail the mileage in Vacation Tour No. 1 somewhat by utilizing a portion of this tour, running direct from Bretton Woods to Portsmouth, and eliminating the Maine woods portion of the trip.

Dover is the oldest place in the state, and is pleasantly located at the lower falls of the Cocheco river. From Milton it is possible to ascend Mt. Tenneriffe. Cobble Crown mountain appears at Union. Ossipee lake, with Green mountain on one shore and Mt. Ossipee on the other, are seen at Ossipee.

Nature is at its best beyond Chocura. The road passes Lake Chocura with the mountain by the same name near its shores. Champney's Falls, Diana's Bath, Echo lake, the Cathedral, vie with each other in holding the tourist's attention, and high above all is the majestic head of Mt. Kearsarge, reached from North Conway. The night stop is at Bretton Woods.

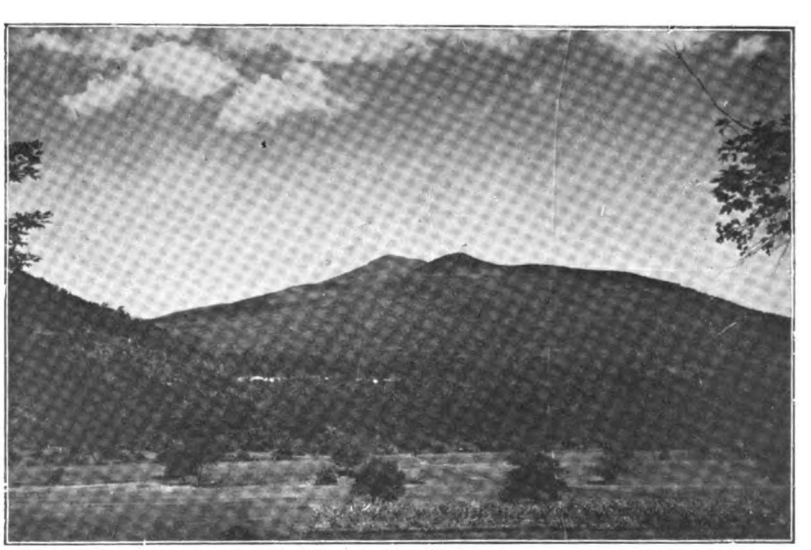
Crossing the White mountains to Bethlehem and Littleton, the tour descends into the Connecticut valley at Wells River, Vt. This beautiful river is followed almost to White River Junction. Hanover, N. H., is the seat of Dartmouth College, and from this point the way leads across the state, in practically a straight line to Lake Sunapee, where the night stop is made.

Bradford, reached early the third day, is a charming village near the island-strewn Bradford pond, much frequented by summer visitors. Mt. Kearsarge is 10 miles to the northeast, and a number of smaller mountains are within easy driving distance. Bradford mineral springs are five miles southwest.

Passing through Henniker and Hopkinton, two pretty little country villages, the next town of importance is Concord, capital of the state. While the city offers much of interest because of its fine old colonial buildings, some noble views are to be obtained from Echo hill, and the Birchdale springs, famed for their efficacy in cases of dyspepsia, offer a number of excellent groves on high, dry, sandy hills amid rich farming country.

Another point of interest at Concord is the beautiful home of the late Mrs. Mary Baker G. Eddy, head of the Christian Science church, called Pleasant View. The place is rightly named, as will be agreed by the tourist who takes the time to visit the grounds, commanding as it does an excellent view of the White mountains.

Exeter is the site of Phillips Academy, and is an elm-shaded, level farming town, in which there are a number of splendid residences. Nearby are Squamscott falls, the Indians about which were friendly to Rev. John Wheelwright, who settled Exeter after being banished from Massachusetts because of the heresy of Antinomianism. When this territory was annexed to Massachusetts in 1672, Wheelwright was banished still further west. The Indians left about the same time, migrating to Troy, N. Y., and their places were taken by more hostile tribes, who captured and destroyed the entire settlement. Phillips Academy was founded in 1781, by Hon. John Phillips, who endowed it with $134,000.



The return to Portsmouth is by the way of Stratham and Greenland, in the midst of rich fruit growing country.

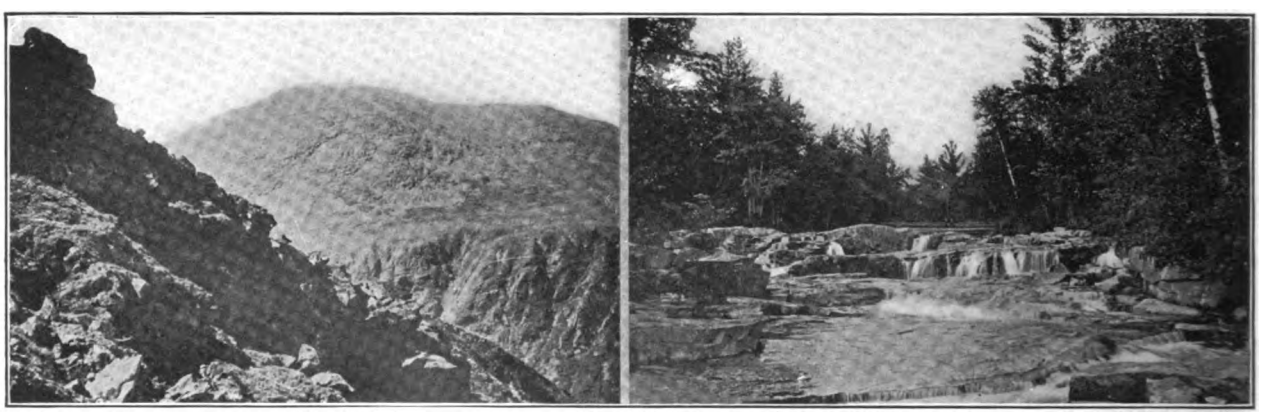
TOUR NO. 21.

Tour No. 21 has Waterbury, Conn., as it starting point, with night stops at Benningington, Vt., and Greenfield, Mass. This course connects with Vacation Tours 1 and 2 in two places and opens up considerable touring country not available until recently.



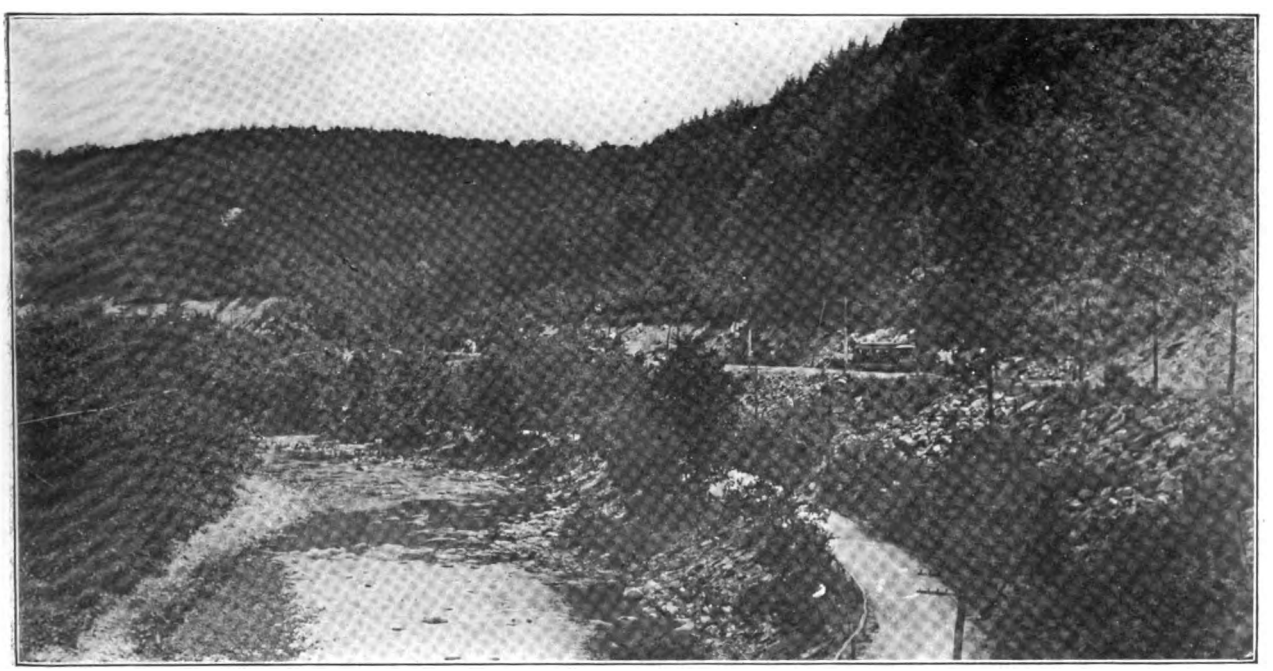
The first day's outline runs over the Litchfield foothills to Litchfield, along the shores of Bantam Lake, the latter portion of the way. Watertown is the seat of Taft's School for boys, of which the principal is Horace Taft, brother of the President. The town is somewhat famed for its silk mills, and while it is in the midst of a rich farming country, these manufacturing enterprises have made it possible for many of its people to enjoy life on a much wealthier scale than is usual in farming communities.

On the way to East Morris the route runs in sight of the Wigwam reservoir, the water supply for the city of Waterbury. Another large reservoir is in process of construction nearer East Morris. Some pretty lake views are to be had between East Morris and Litchfield, where connection is made with Tour No. 14.

Beyond Litchfield the way leads into Goshen, home of the Goshen hardhack, a troublesome bush, which overruns the country and completely devastates rich farms unless a continual warfare is made against it. Mountainous country is encountered on the way to Norfolk, located on the highest land in the state, and famed as a summer resort for many New York people. Within the past few years, Norfolk has come to be known for its summer concerts, for which Mr. and Mrs. Carl Stoeckel have provided an immense auditorium among the hills. Magnificent views in every direction are to be seen at this part of the trip.

At East Canaan, are the Twin lakes, on the banks of which are located a series of caves, recently discovered, through which the tourist may ramble for some distance in underground caverns. Bear, Bald Peak, Haystack and Talcott mountains are located near here, and from the top of Haystack mountain may be had a view probably not excelled in America. Mountain peaks in Connecticut, Massachusetts and New York are plainly visible.

The tour joins Vacation Tour No. 1 at Great Barrington, and follows it through Bennington, Vt., the night stop, to Manchester. Here, it turns toward the Green mountains, crossing them by way of Peru, Londonderry and Simonsville to Chester. The road of Peru mountain gives some excellent views, but is notorious for the number of water bars. Extreme care should be taken in driving over this portion of the route. At Chester, descent is made into the



In the White Mountains of New Hampshire: At Left, Looking Toward Mt. Washington; at Right, Artist Falls Near North Conway.

Digitized by Google

Connecticut valley at Bellows Falls and Brattleboro. The night stop is at Greenfield, the route being the same as that for Tour No. 15 at this point.

The third day gives the tourists some interesting country, over which it has not been thought possible to tour until recently. Road improvement has opened up this territory within the past few years and automobilists will do well to visit the country often. From Greenfield to Northampton the way leads along the west shore of the Connecticut river. Northampton is the seat of Smith College for girls, and there are some very interesting drives in its vicinity.

In the Naugatuck Valley, Above Waterbury, Conn., the Litchfield Foothills on Either Side.

On the way to Easthampton, seat of Williston Seminary for boys, Mt. Tom rears its head above at the left. Continuing through Southampton and Westfield the tourist approaches Southwick ponds, where is harvested a large portion of the ice supply for the city of New York. The Connecticut state line is crossed near these ponds, and just south of the line is Newgate prison, the first revolutionary prison in this country. The outlook from this point is doubly interesting not alone for its historic features, but because of the natural beauties.

Tour No. 14 is reached at Farmington and Vacation Tour No. 1 at Plainville, the latter of which may be followed back to Waterbury, but it is advisable to continue the present outline through Bristol, Terryville, Plymouth and Thomaston, the best known clock country in the world. The roads are excellent with exception of Plymouth hill, taking up the entire distance between the towns of Plymouth and Thomaston. The surface of this hill is macadam for the most part, but the grade is so steep and the railroad crossing at the foot so dangerous that extreme care must be taken. A detour is possible, going about by the Thomaston water works, and while it adds a few miles to the total itinerary the views are sufficient to repay for this.

The return to Waterbury from Thomaston is through the Naugatuck valley, with high hills on either side and some interesting glimpses of the river, if the season be not dry and the waters of the river nearly invisible in consequence.

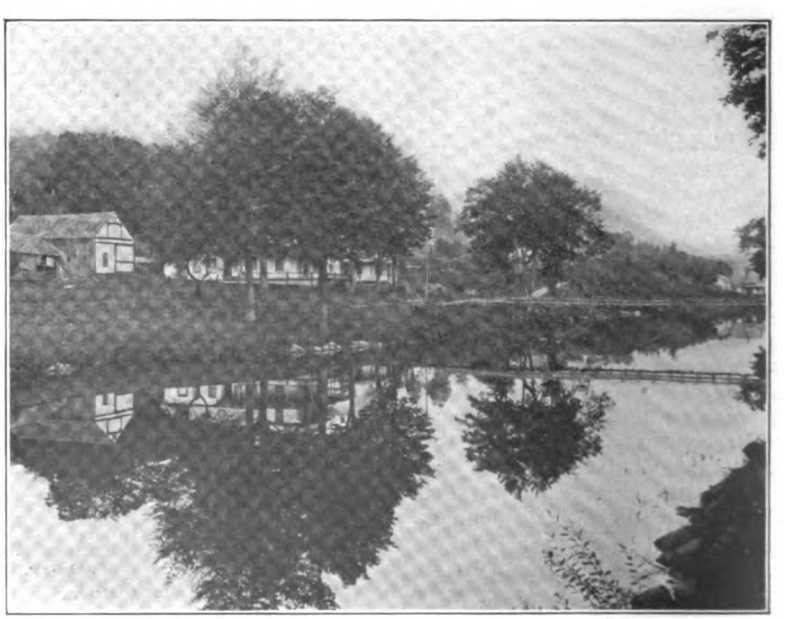
Southlands. Thence it skirts the western portion of the Franconia range, to Bethlehem, and from that point crosses the Presidential range to the eastern side, with night stops on the homeward trip at Poland Spring, Me., and Portsmouth, N. H.

The route selected is over ways not so well known to motorists, even in New England. For this reason, it is believed that it will be accepted as a most desirable alternative for the more extensively travelled White mountain tours. The location of the starting point is such that it may be reached readily from New York or the West.

Leaving Springfield the first day, the route lies along the Connecticut valley, through Chicopee and Holyoke, and thence over the hills to South Hadley, seat of Mt. Holyoke College for girls. Just before reaching the campus are the South Hadley falls, concerning the fantastic beauty and sublime majesty of which much has been written. The surroundings at the college are particularly pleasing, and the grove frequently is utilized as an outdoor stage, upon which to present Shakespearian plays and kindred productions.



Just above Moody's Corner the road enters a narrow gorge between two mountains of the Holyoke range, and from this point to Amherst the views of Mt. Holyoke and Mt. Tom, on either side of the Connecticut river are particularly delightful. Several institutions of learning are passed during the day, including Amherst College at Amherst, Masachusetts Agricultural College at North Amherst, Moody's School for Girls at Northfield and Mt. Hermon School for Boys at East Northfield.

On the way to Hinsdale, N. H., a splendid outlook upon the new dam of the Connecticut River Company is afforded. The way then joins the better known route between Brattleboro, Vt., and Keene, N. H. Beyond Keene it turns toward Newport and the night stop is at Sunapee on the shores of the lake by that name.

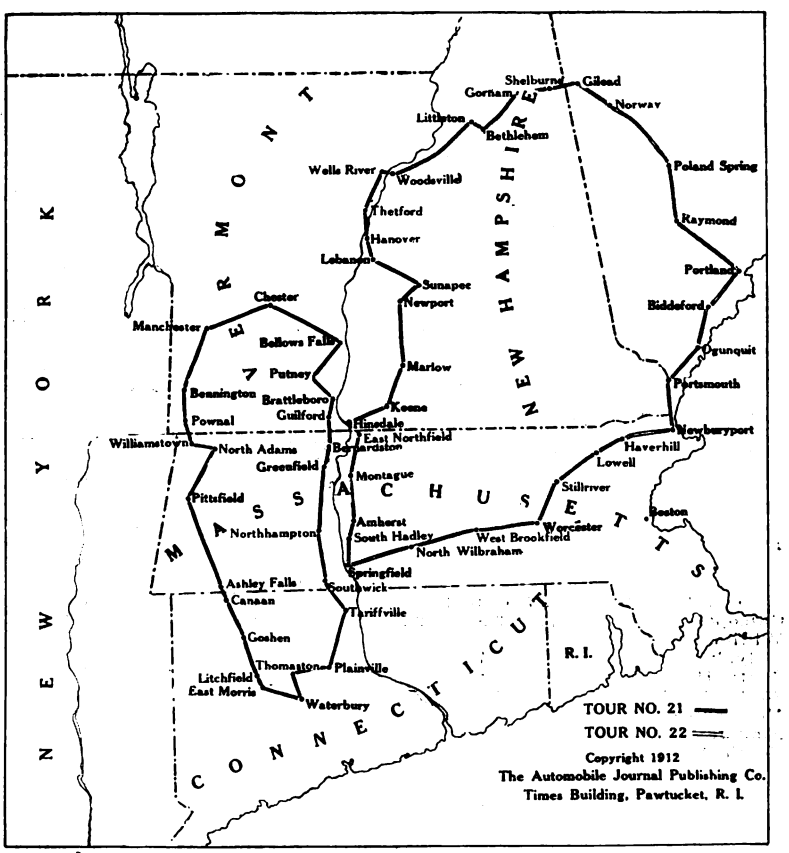
TOUR NO. 22.

The great Appalachian system of mountains, extending from the Gaspe peninsular at the mouth of the St. Lawrence river in Canada to northern Alabama, possesses no more beautiful or awe inspiring group than that commonly known as the White mountains of New Hampshire. They fill the eye of the beholder throughout a stretch of country hundreds of miles in extent. The motorist may approach them from four different directions, and each time there is something new in their aspect.

In the itinerary outlined below, it is anticipated that the tourist will leave Springfield, Mass., and be occupied five days in visiting this region. The White mountain country is entered by way of Lake Sunapee, which may be regarded as one of the gateways to the

The Mirror in the River at South Londonderry, Vt.

Digitized by Google



Several small mountains are in the vicinity of Newport, and there are any number of romantic glens along the Sugar river nearby. The new state highway begins at this point and is utilized into Hanover. Croydon is located near the mountain of that name. Splendid views follow each other with such rapidity as to bewilder the motorist. Lebanon is a small manufacturing village on an elevated plain near the falls of the Mascomy, while at West Lebanon is the Tilden Ladies' Seminary, whose fine buildings are seen on a commanding hill.

Hanover is the seat of Dartmouth College, founded in 1770 as a school for Indians, and which, at first, had 24 students, domiciled in huts built of green logs, situated in the midst of a vast wilderness. Distant views of Moosilauke and Bald mountains are obtained as the tourist approaches Thetford. North Thetford produces much copper ore, which is sent overland to Portsmouth, N. H., and thence to Baltimore by ship. Fairlee is a hilly town abounding in pretty lakes, one of which is nearly three miles long. Mt. Cuba and Mt. Sunday cast their reflections upon these waters. Cuba falls and the perpendicular cliffs of gray granite on Sawyer's mountain are worthy of notice. Near Bradford is Devil's Den on the side of Wright's mountain, where one Wright, who claimed to be a prophet, lived the life of a hermit in a dismal rocky cleft.

Crossing the Connecticut river from Wells River, Vt., to Woodsville, N. H., the tourist enters the White mountain region, the recurring grandeur of which he has been admiring throughout the day from a distance. Bath is a fine old farming village, with a picturesque glen. Lisbon is somewhat noted for its gold mining. Then comes Littleton on the far-viewing heights, from which splendid panoramic scenes of the Presidential and Franconia ranges may be had. Bethlehem, the night stop, is the summer capital of the entire region. The view of the White mountains is broader and in some respects more imposing here than that from any other point.

The third day takes the tourist through the very heart of the entire district. Those who desire, may obtain permission to ascend Mt. Washington from Randolph hill, where the view from the Tip-Top House is the most extensive in New England. River scenery combined with impressive mountain forms in the vicinity of Gorham is said to surpass all other districts from which the highest peaks are visible. The drive to Gilead, Me., is along the river with ever-changing pictures of the hills.

The broad intervales of the Androscoggin spread out in all

their fertility and fairness at Bethel, while splendid views of the mountains are still obtained from the surrounding hills. The tour then passes through a country well supplied with lakes and ponds, on the way to Norway and Welchville, and the night stop is at Poland Spring, a summering place much noted for the purity of its water, large quantities of which are exported to various countries.

The route from Poland Spring to Portland is somewhat longer than that usually followed, giving opportunity for a visit in the vicinity of Lake Sebago, 14 miles long and 11 wide. Picturesque contrasts of farm and forest, granite ledge and intervale, make this a delightful trip. From Portland to Portsmouth, the way is over the accepted trunk line from Boston and is almost too well known by motorists to need extended comment.

After spending the night at Portsmouth the tourist finds a long day's drive ahead of him before reaching Springfield. The roads are of macadam for the most part, and it is anticipated that little difficulty will be found in making the mileage indicated. The trunk line, above mentioned, is followed into Newburyport, Mass.

Haverhill, Lawrence and Lowell are all large manufacturing cities, each with its special individuality. Thus, Haverhill is built on hills which slope toward the Merrimac, navigable to this point. Lawrence is considered the most beautiful factory city in New England. Lowell is located at Pawtucket Falls, a favorite fishing place of the Indians, and is somewhat well

Digitized by Google

Campus at Mt. Holyoke College.

Lake Sunapee and the Southlands.

known to motorists, because of the road races formerly held there.

Harvard is a picturesque farming town and Clinton is noted for its Brussels and Wilton carpets. Wachusett mountain and lake are passed just before reaching Worcester, and from this point the way is over the main trunk line between Boston and Springfield.

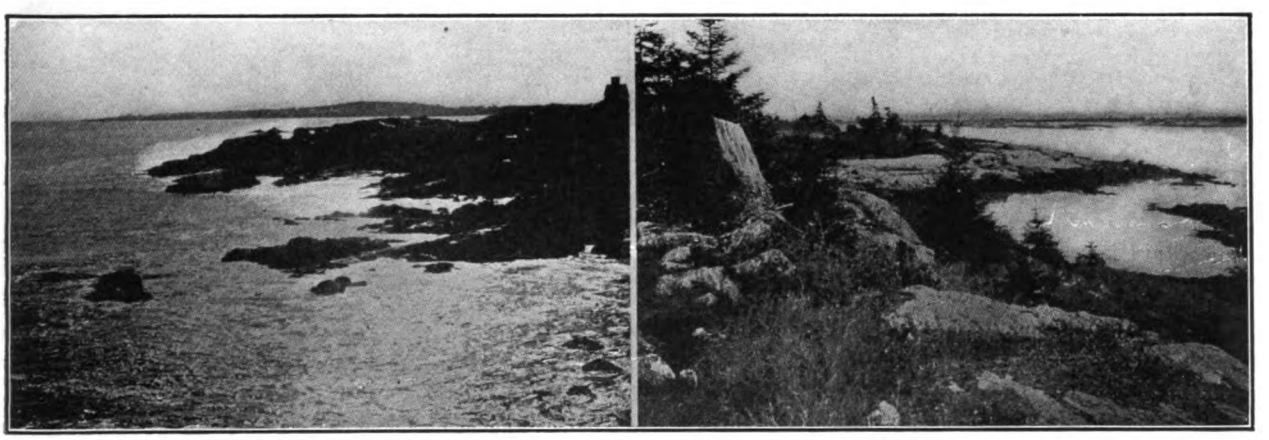
TOUR NO. 23.



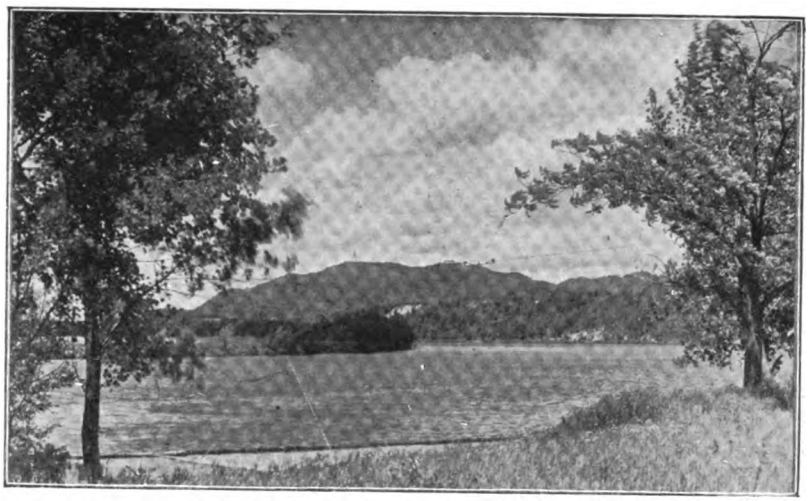
Tour No. 23 crosses Rhode Island in a diagonal direction, leading into Thompson, Conn., the Elysian Fields of the Nipmuck Indians and the reputed home of the Great Spirit. Beyond, on the way to Webster, Mass., is Lake Chabonakongkomon, which also is known as Chargoggagoggmanchoggagogg, an island strewn pond which is pretty enough to warrant an even better name.

After crossing the line into Massachusetts the tourist finds good macadam all the way to Springfield and beyond. At Westfield and Woronoco, a detour may be made to visit the Little River water works of the city of Springfield, the dam for which is located in a gorge. From this dam the water flows through a tunnel nearly a mile long to the filter beds near the road at Little River.

The road to Huntington is most picturesque and beyond that point the hills about Goshen and Williamsburg are to be found numerous rare minerals, although not in sufficient quantities to warrant extensive working.

Reaching Northampton, by the way of Haydenville and Florence, the road leads down the west bank of the Connecticut, passing Smith's Ferry, from which point it is possible to visit Mt. Holyoke. While Mt. Tom railroad station is reached before Smith's Ferry, the mountain itself is not passed until later. The view of the Connecticut at this point is unexcelled.

Holyoke is the Paper City and numerous paper mills are to be seen in connection with many handsome buildings. Still continuing on the west bank of the river, Springfield is entered over the North End bridge, crossed on the outward route. Going through the city to the South End bridge, the way leads into Connecticut at Suffield, a pretty little town in the midst of an extensive tobacco growing country. The road to Hartford, the night stop, is through Windsor Locks and Windsor, still on the west side of the river.



Shore at Cliff Island, Casco Bay, Me. **Sunrise at Cape Elizabeth, Portland Harbor.**

On the way from Hartford to Willimantic the tour enters Bolton Notch, a romantic pass from the Connecticut valley. A little later the smaller towns of eastern Connecticut are reached, and the journey from Chepachet to Providence is over the same itinerary as at the start. This tour may be utilized by Rhode Island people in connecting with Transcontinental Tour A at Albany.

Lee is best known because of its excellent white marble. Laurel lake is a pretty sheet of water about a mile north of the town. Then follows Lenox, with its beautiful wealthy estates, on the way to Pittsfield, the night stop.

Dalton is in the midst of the country noted for its Saxony and Merino sheep. Hinsdale offers some especially fine mountain views, and the hills of Peru are to be seen on the east. Cummington is another of the hill towns, noted for its grazing and dairies. In the Berkshire hills are crossed, Becket being the highest altitude. Jacob's Ladder no longer has terrors for the motorist, the old time road having been replaced with a fine macadam stretch. Several interesting lakes are located within the town of Becket.

TOUR NO. 24.

Famed as are the mountains, lakes and rivers of New England, it must not be denied there are numerous vacation spots in these states that are not so well known as their beauty would warrant. The same will hold true with respect to Long Island. And while this latter ground is more or less familiar to tourists from New York City, there are many motorists who have never taken the time to explore its resources.

In the accompanying itinerary, it is anticipated that three days will be devoted among the lesser known portions of this section. The start is made from Hartford, Conn., and the tour first reaches the Litchfield hills, and crosses Long Island sound for a day on the island itself, before returning to the capital of the Nutmeg State over ways perhaps somewhat better known.

Leaving Hartford, Farmington is the first interesting place reached. The town occupies a beautiful situation on the banks of the river of the same name. A broad and shaded street two miles

Deerfield River in the Vicinity of Shelburne, Mass.

Digitized by Google

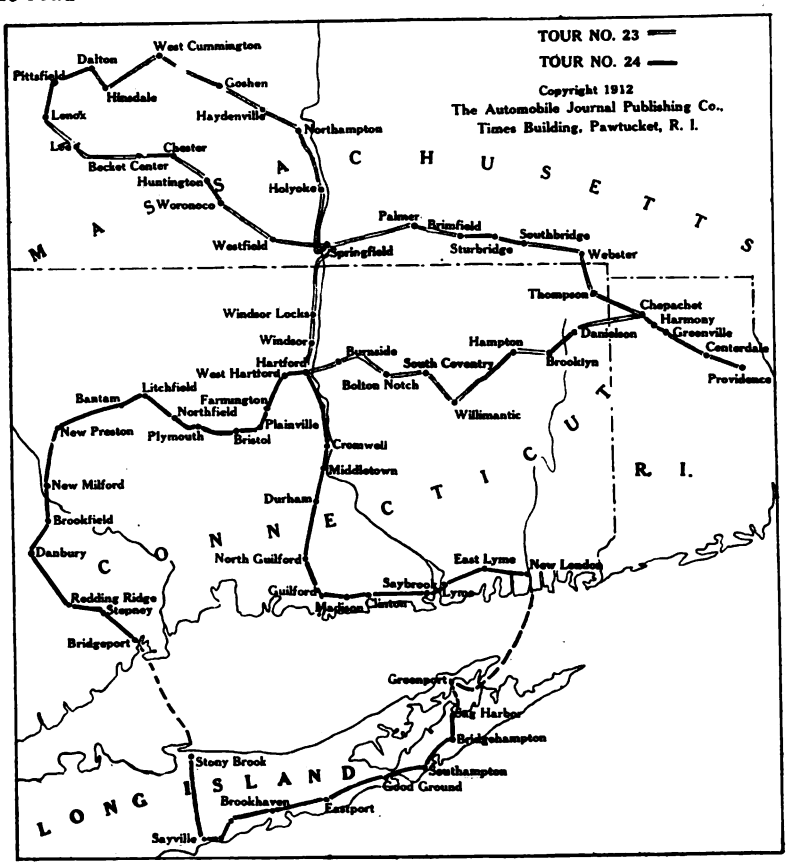
long, practically composes the village. It was settled in 1640, and it was here that the village pastor preached to the Continental army on its march to Boston in 1775.

Plainville, with its macadam ways, Forestville, and Bristol follow in quick succession. The tourist is now in the centre of the original clock making industry in America. Eli Terry began the manufacture of these goods in a small shop in Terryville, but the business very soon spread to Bristol and Thomaston, both of which have been producing clocks for many years. Just before reaching the latter town, the route leads down a very steep hill, practically one mile long, although a detour may be taken if deemed advisable.

Northfield is a knife making centre, much of the cutlery being hand forged; the material is imported steel from Sheffield, Eng., whence many of the employees came. The road from this point to Litchfield is nearly all upgrade, and as the hills are climbed new scenes unfold themselves in rapid succession, and while the so-called mountains are small of stature the car finds much less difficulty in making the grades than would be the case in other portions of the chain.

Litchfield occupies an interesting place in history. The first law school in America was opened in a small building which is shown visitors with justifiable pride. During the summer months, the hill top is the favorite home for many New York people, and Bantam lake, only a few miles distant, and distinctly visible from many points, lends an added charm.

This lake is passed on the way to Bantam and New Preston. Just beyond the former town the road takes a dip between two high hills, one of which is known locally as Mt. Tom. New Preston commands a pleasing view of the surrounding country and easily explains the attractiveness of the section. Here, time should be taken to drive about Lake Warramaug, a splendid boulevard making this possible without difficulty.



New Milford is near the junction of the Housatonic and Aspetuck rivers, with a wide verdant park and well shaded trees. Nearby is a silver mine, which was worked prior to 1790, and the town is one of the centres of the tobacco trade in the valley. The way then leads along the Housatonic to Brookfield and beyond, and finally reaches Danbury, the home of the hat industry.

From this point to Bridgeport the road is most direct. Stop may be made to visit Putnam Park, established in memory of Israel Putnam. If desired the boat across the sound may be taken in the evening. The ferry is operated only twice daily, at 1:30 and 6:30 in the afternoon. Should the tourist elect to remain over night in the Park city, abundant opportunity may be had to explore the vicinity before taking the first boat to Port Jefferson on the following day.

The harbor at the latter place is conceded to be one of the most beautiful on the sound. The town is built up on terraces, which extend back from the water's edge in pleasing array, the many hued trees lending their charm to the situation.

The second day soon finds the tourist at St. James, in which is located the summer estate of Mayor William J. Gaynor of New York City, Deepwells. A drive through pretty woodland leads to an arm of Lake Ronkonkoma, the terminus of the Long Island Motor Parkway. About this lake are numerous little coves and streams which form a perfect outline of a pair of spectacles. The lake itself has baffled government geologists in their efforts to learn why this body of fresh water should have a tide which rises and falls every seven years. It has no direct connection with the sound, the ocean or any other tidewater, and its actual depth is not known.

Then comes Bread and Cheese hollow and the headwaters of the Nissequogue river, the happy hunt-

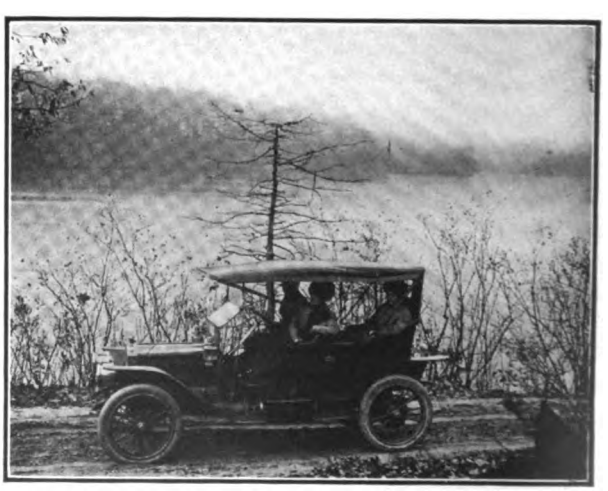
ing grounds of the Long Island Indians. And finally the motorist finds himself on the opposite shore of the island at Bayport. The way turns eastward along this shore to Sag Harbor and Greenport. Boats leave Sag Harbor for New London at 6 in the morning, at 12:30 in the afternoon, and Greenport at 6:30 and 1:40. The tourist has the option of remaining on the island or crossing to the mainland, depending largely upon the time he arrives at these places.

The third day leaves New London behind to enjoy the beauties of the Connecticut shore. The route is over the main line to New York for some distance, crossing the Connecticut river on the new bridge between Lyme and Saybrook. Of course, the return to Hartford may begin at Saybrook, following the better known Connecticut valley road, but it is anticipated that the trip will be undertaken for the purpose of exploration, and the itinerary as outlined from Guilford will be found fully as enjoyable.



Lyme is a venerable hamlet, half-buried in foliage, its Main street lined with old trees and historic mansions, among the latter being Black Hall, the homestead of the patrician Griswolds. Westbrook and Clinton, are two quiet towns on the shore, much frequented by summer people, because of the absence of the trolley and other disturbing seaside factors. Madison is almost equally known in this respect.

Guilford was settled in 1639 by four immigrants from Kent and Surrey, England, its former Indian name being Menuncatuck. During the extermination of the Pequots by the Mohegans, a few years previous to this time, the sachem, Uncas had his headquarters at this point and numerous battles were fought in this vicinity. In 1781 the regicides were hidden in an old house, which still stands. Three frigates landed a force which marched through the streets during this period, but the rapidly gathering militia drove them off, before the fugitives were located.

North Guilford is somewhat isolated from the surrounding country and offers abundant opportunity to witness the quaint and beautiful. The sound may be seen at intervals, but the motorist's attention is much more likely to be

The Happy Hunting Grounds in Nissequogue Valley, on Long Island.

Skirting One of the Little Ponds in the Vicinity of Lake Ronkonkoma.

Digitized by Google

taken up by the interesting bits of woodland scenery, which continue through Bluff Head, from which point pleasing outlooks upon the Connecticut river begin to come into view.

After reaching Middletown, the road follows this river through Cromwell, Rocky Hill and Wethersfield. This is a favorite drive for Hartford motorists and is almost too well known to need comment. Rocky Hill is so named because of its trap rock and sandstone ledges, and commands an interesting view of the river toward the north, clear weather making it possible to discern the outlines of Mts. Tom and Holyoke in Massachusetts, leagues away.

TOUR NO. 31.

Tour No. 31 opens up country, which until very recently was little frequented by motorists. It is outlined to occupy three days with night stops at Moosehead and Rangeley lakes. The starting point is Portland. The territory covered is largely in the Maine woods, but over roads which have been put in excellent condition within the past year. That portion of the tour lying between Portland and Moosehead lake has been constructed for the particular use of motorists, and a splendid new garage has been erected at Greenville Junction, where the steamer meets the tourist for the journey to Mt. Kineo. This tour connects with Tour No. 12 at Augusta and Vacation Tour No. 1 at Newport. By following the latter to Bangor, it is possible to connect with Tour No. 32, for New Brunswick points.

Moosehead lake is famed in prose and poetry for its immense size and scenic loveliness. It is the largest and best fishing ground in America. Deer and moose abound in great numbers. The lake itself is 40 miles long and from two to 18 miles wide. It contains many bays and beautiful islands which add to the charm and fascination of the scenery. The surrounding hills are lofty and covered with deep forests, while here and there a mountain towers above the green of the level woods, the whole forming a rare panorama of which the eye never tires. Grandest of all these is the

One of the Pleasing Bathing Beaches at Kennebunkport, Me.

famous Mt. Kineo, whose precipitous face looms up nearly 1000 feet above the surface of the lake, and whose western slope runs off into a level, green-clad peninsula.

The route from Moosehead to Rangeley is through the Maine woods practically all of the way. The Rangeley lakes are five in number, and have a total area of about 90 square miles. All are interconnected by narrows and streams, making a continuous waterway of 56 miles. The Rangeleys are the source of the Androscoggin, which has its rise in Lake Umbagog, and emerges from the forest to find its way to the sea after turning scores of mill wheels on the way.

The farthest east is Lake Oquossoc, conceded to be the gem of the entire chain and most often referred to as Rangeley. Its elevation is 2000 feet above sea level. Across the outlet is Bald Head, a mountain easy to climb, and an ideal spot from which to watch the sunrise. Mooselucmaguntic is the largest of the five. Separated but slightly from this, and really a portion of the big lake, is Lake Cupsuptic. Then comes Molechunkamunk and Wolokennebacook. The waters of all these lakes is as clear as crystal and so large are the fish taken from them, it is an unwritten law that trout of less than three pounds shall be returned to their native element.

The return to Portland, the third day is over a portion of the route covered in entering the Rangeley lake region, thence southward through South Paris, Mechanics Falls, Lewiston, Auburn and Poland Spring. It is assumed that the tourist taking advantage of this tour will be most interested in the lakes and woods, although Poland Spring is a resort, which is much frequented in summer. It has many fine views of the White mountains as well as of the Maine woods, and the spring is famed the world over for the purity of its water.

bile is sufficient indication that it can be travelled again, but its use is by no means advised except for the very excellent views to be had thereon.

At Ellsworth, on the first day's run, connection may be made with Mt. Desert Isle and Bar Harbor. As automobiles are restricted at this famous resort, it will be necessary to make inquiries before proceeding on this portion of the tour. A splendid view of the isle and the mountain thereon are to be obtained from this point.

Continuing on the direct route to Mt. Desert Isle the tour passes Franklin pond, a large sheet of water which empties into Frenchman's bay at Hancock. The way is along the eastern coast of Maine, with its many indentations, and consequent fine marine views, of the oldest Masonic lodge rooms in the country, the lodge having been instituted Sept. 10, 1778.

Marion is in the heart of a splendid partridge country. Deer are also plentiful in this section. Dennysville is a picturesque country village, on the shore of the Dennys river, which flows between high banks wooded with evergreens and through deep gorges with rocky sides.

Calais, the night stop, is well known as the border town. The people of Calais and those of St. Stephen, across the river in New Brunswick, always have lived on the most fraternal terms. They formed and kept a compact not to engage in the war of 1812. It is possible to make this region the basis for an extended stay in eastern Maine, visiting the Grand

Cape Neddick Light and the Nubble, a Notable Marine Scene Between Portland, Me., and Portsmouth, N. H.

TOUR NO. 32.

Tour No. 32 is planned as an auxiliary to Vacation Tour No. 1, connecting at Bangor for eastern Maine and New Brunswick points. It is scheduled to occupy four days, and an alternate return route from Calais to Bangor is given for the fourth day. It is not recommended, however, except for those venturesome spirits who are willing to test the car's endurance, over roads that are such in name only. Unless very recent changes have been made, much of this alternate route is overgrown with grass, and in places the tree branches seriously impede the car's progress. That it has been traversed by automobile through Sullivan, Gouldsboro and Steuben to Cherryfield.

This town is attractively situated on the picturesque Narraguagus river, and is in the midst of a number of noted fishing ponds. Several well known woodcock covers are also near here. Then comes Harrington, one of the prettiest little villages in Washington county, with many desirable drives along the bay.

Machias is an historic old town, noted for its many business enterprises. The town is located on both sides of the Machias river at tide water, and up this river, reached either by canoe or automobile, are numerous lakes, and a hunting and fishing territory embracing over 300,000 acres. At East Machias may be seen one lakes region, and a pretty little side trip to Eastport may be taken if desired.

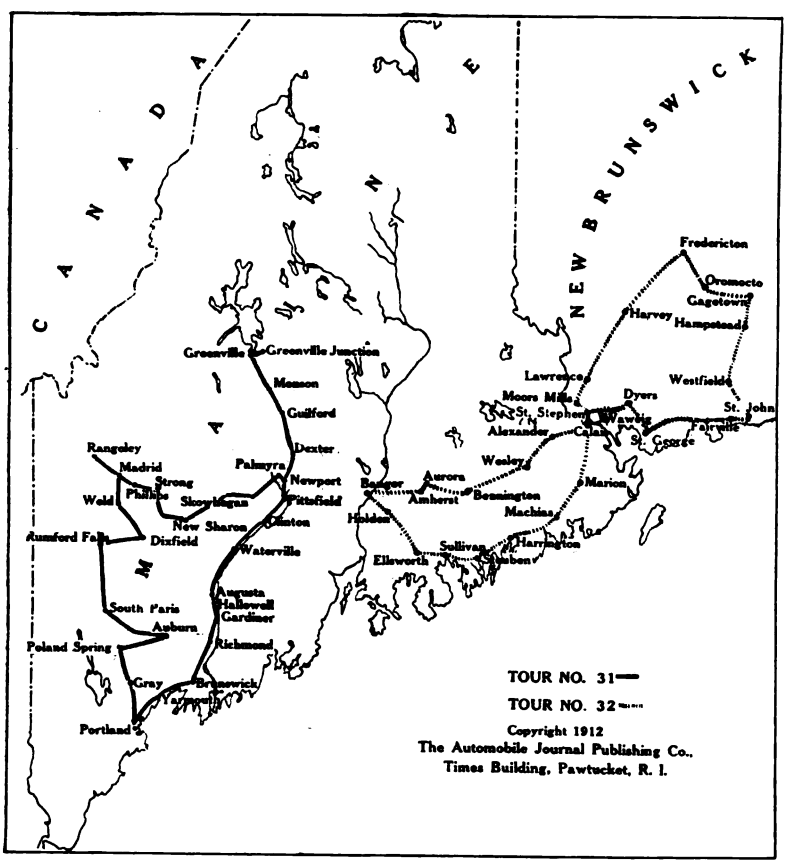
The route from St. Stephen to St. John is by way of Fredericton, and while it is somewhat longer than the shore route, over which the return trip is made, it is assumed that the tourist will desire to visit this interesting country. As the road is practically all down grade from Fredericton to St. John, it follows that it is much better to take the trip in this direction, since there would be a steady climb to Fredericton if it were reversed. Customs regulations must be arranged at St. Stephen.

Fredericton is a small city, beautifully situated on the St. John river and distinguished be-

Digitized by Google

cause of being the political capital of the province. The government house is a plain and dignified stone building in extensive grounds just north of the city, and the Parliament house is a modern structure near the deserted barracks. The University of New Brunswick has fine buildings on a commanding hill near the city.

The St. John river is very picturesque, and a number of other streams empty into it at various points, adding to the charm. Numerous islands are passed, and the road crosses many rich intervales. At one or two places may be seen abandoned forts, which were the centre of long sieges 200 or 250 years ago. Just before reaching St. John the river enters a narrow channel between palisades, and below is the suspension bridge over the famous reversing falls. The tides in the Bay of Fundy are well known throughout the world, and these falls, over which the river dashes through a narrow gorge at low tide, have the appearance of flowing up-hill as the tide rushes upward through the gorge far above the river level.



St. John is the metropolis of the province, and it is possible to make connections here for a number of pleasant trips through Nova Scotia, across the bay. Ample time should be available to take advantage of a number of interesting drives about the city, particularly that to the heights of Carelton; over Marsh bridge to Red Head, or to the cemetery and Loch Lomond.

The return trip to St. Stephen is along the coast, with splendid views all of the way. This is known as the St. George road, but care should be taken at Lepreaux that this old way is not followed between that town and St. George, inasmuch as the longer route outlined will be found to be much better. This is the main line taken by most tourists from the provinces to the States, and will be found in excellent condition throughout.

As explained at the beginning of this outline, the return route from this point to Bangor is not the best. However, there are some excellent views to be obtained and much of interest in the towns visited. Wesley is noted for the number of bears that have been shot within its confines. It does not follow that the tourist will see a bear if he takes this route, although he is pretty certain to find the woods well filled with deer in the immediate vicinity.

The virgin country about Beddington is particularly well supplied with partridges, and there are a number of splendid camping sites to be found readily. Connection may be made with Cherryfield, if the tourist has decided by this time that he would prefer the other route. The distance to Cherryfield is 20 miles from Beddington.

While the road is by no means good, the views from some of the hills en route are distinctive to this portion of the country. Wooded hills are intermingled with entrancing lakes, and each has its own particular individuality. It is all rich sporting and fishing country, and while houses will be found few and far between, and the gasoline supply an entirely unknown quantity, an occasional camp will be passed, and there is no danger of getting lost.

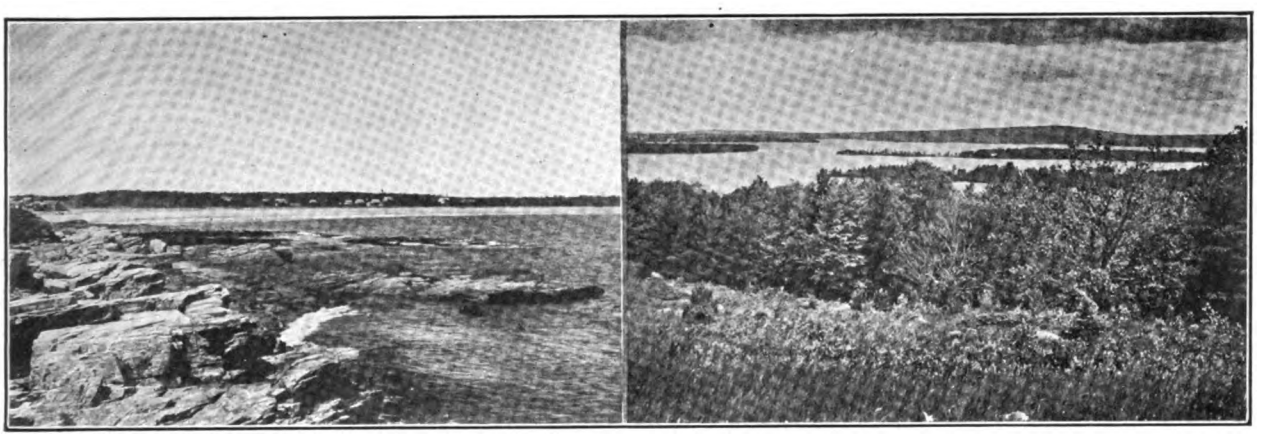
TOUR NO. 41.

The three-day trip outlined in Tour No. 41 is offered as a substitute for the better known route between Quebec and the States by way of Jackman, Me., and is suggested as a continuation to Vacation Tour No. 2 at Montreal. The starting point is at Newport, Vt., and the night stops, Quebec and Montreal.

The customs formalities must be arranged at Stanstead, a short distance from Lake Memphremagog. Several picturesque lakes are viewed on the way, including Massawippi, near the town of that name; Noir, near Marbleton; Weeden, near Weeden; Aylmer, at Garthby; Francis, at D'Israeli; Clapham and Marie, between Thetford Mines and Robertson. Marbleton is noted for its marble quarries and lime pits, while at Thetford Mines are located the largest asbestos deposits in the world. Bell mine has an area of several acres and a depth of over 150 feet.



The final portion of the drive into Quebec is exceedingly picturesque. Beyond Leeds, Parkhurst and St. Giles, the road winds along the bank of the Beaurivage river to the St. Lawrence. It is expected that the magnificent Quebec bridge, which is said to be the largest single span bridge in the world, will be opened this year, and that the tourist will not be obliged to enter the city by ferry as has been necessary heretofore.

The wreckage of the destroyed bridge has been cleared away and the work of constructing the new span to take its place has been pushed rapidly toward completion.

Quebec is filled with historic interest. In many respects it is the most quaint and picturesque city on the American continent. Of the many side trips, the following may be mentioned: Ste. Anne de Beaupre, where thousands of pilgrims annually visit the relics for miraculous cures; the falls of Ste. Anne and those of Ste. Fereol, still further to the east; Lake Beauport, Indian Lorette, and Cap Rouge.

The view of Quebec from the St. Lawrence in the early morning is said to be a sight never to be forgotten. Above the city the river flows between the Laurentian mountains. Then the tour passes Lake St. Peter, where the St. Lawrence broadens out on the lowlands. Among the features of this body of water are the lumber rafts on which are carried the rude huts of the lumbermen. At various points along the route, quaint old towns are passed, in which the people, like those during the previous day's drive, speak French for the most part, and many old-world characteristics are noted.

Chambly, reached early the third day, was fortified by the French in 1711, and in 1775 it had a strong stone fort, erected by the British. The town is situated on a lake-like expansion of the Richelieu river, known as the Chambly basin, and the Chambly rapids are nearby. Knowlton is at the foot

of Brome lake, with Brome mountain about 10 miles distant, although in full view. At South Bolton, the tour goes through the Bolton notch, with excellent views along the way. Customs arrangements may be perfected at Mansonville. The return to Newport from this point is along the shore of Lake Memphremagog with excellent views of Owl's Head.

TOUR NO. 42.

Tour No. 42 is offered as a connecting route between Vacation Tours 1, 2 and 3, starting at Burlington, Vt., and occupying three days' time. The night stops are at Cascade Lake and Paul Smith's, both in the Adirondacks. It is anticipated that this will prove a valuable connecting link between New England points and other sections covered by the itineraries outlined in this annual touring number.

The first day takes the tourist along the east shore of Lake Champlain to Grand Isle and thence over the New York state line to Rouse's Point, where connection may be made with Vacation Tour No. 2 for Montreal. Reversing this route for some distance, the tourist visits Plattsburg and the Ausable Chasm, then turns away

Winooski River, Scene in the Vermont Hills at Middlesex.

Digitized by Google

toward the Adirondack lake region. Vacation Tour No. 3 is reached at Keene.

The second day, after spending the night at Cascade Lake, is devoted to driving among the lakes of this region, including Upper, Lower and Middle Saranac, Tupper, Big Tupper, Clear, Regis, Spitfire and Lucretia. Innumerable small ponds are also included in the visit, and mountains as well. A fairly good automobile road is traversed all of the way. Those who so desire may venture still further within the mountain passes and explore still other lakes and ponds, but those included in the day's itinerary are all that may be visited with safety by automobile.

However, there remains another collection of lakes and mountains for the third day, on the other side of Vacation Tour No. 3. Lake Meacham is 12 miles north of Gabriel, three miles long by two wide, lying in the midst of 6000 acres of virgin forest. Rainbow lake has many devious windings which make it an ideal spot for canoeing. North of this is Lake Kushaqua, a beautiful resting place. A little to the west is Loon lake, 2.5 miles long with rocky irregular shores.

The tour then returns to Plattsburg and Lake Champlain, where it is anticipated that the motorist will have had quite enough of driving and will be anxious to return to Burlington by boat. In case he prefers to continue by automobile, he has the option of reaching Burlington over the reversal of the first day's itinerary or by way of Vacation Tour No. 3 to Westport and ferry to the Vermont side.

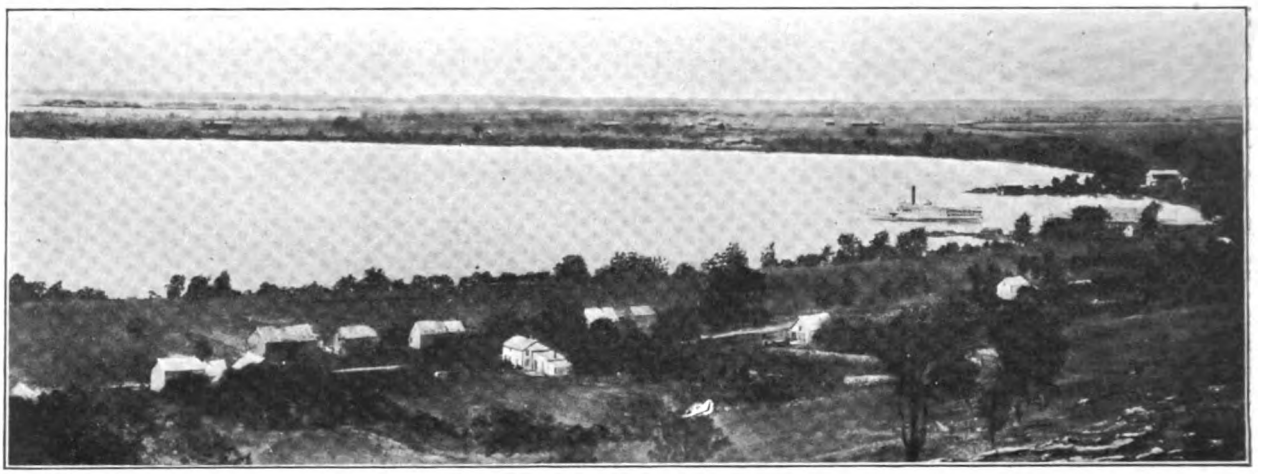
Boat to Burlington		



TOUR NO. 43.

Tour No. 43, starting from Rutland, Vt., is outlined primarily as affording a means of connecting Vacation Tours 1 and 2 at this point. It is anticipated that there will be those who will desire to leave New York for a visit to the Green mountains and continue their trip into the White mountains, without continuing Vacation Tour No. 2 to Canada. This three-day itinerary admits of this, and still offers the possibility of returning to take up the journey where it was broken off. Still another possibility is offered, in that Tour No. 43 connects with Vacation Tour No. 1 at three different points, furnishing the alternative of connecting with Tour No. 42 at Burlington and regaining Vacation Tour No. 2 at Rouse's Point, N. Y.

From Rutland, the itinerary leads across the easiest of all the Green mountain passes through Mendon, Sherburne and Bridgewater to Woodstock, on the crystal clear White river. From Mt.

Pleasing View of St. Albans Bay, One of the Most Attractive Points on Lake Champlain.

Tom, near here, an excellent view down the river may be obtained. The valley of this river is followed to White River Junction, where connection is made with Vacation Tour No. 1.

Crossing the Connecticut river, the way leads to the White Mountain region at Plymouth, N. H., the night stop. Connection is made here with Tour No. 12, which may be followed in either direction to reach the Bretton Woods or Dixville Notch. The second day's outline returns to the Connecticut valley at Wells River, Vt., in full view of the Franconia range most of the way. St. Johnsbury, where Vacation Tour No. 1 is again reached, is the turning point toward the west.

The main route is touched again at Montpelier, after visiting Danville, South Cabot, Molly's Falls, Marshfield and Plainfield. This is made the second night's stop. The third day the main route is reversed for a short distance until the Williamstown gulf is passed. Then, the way turns toward the west to connect with the Green mountain pass by way of Gaysville, Stockbridge and Pittsfield.

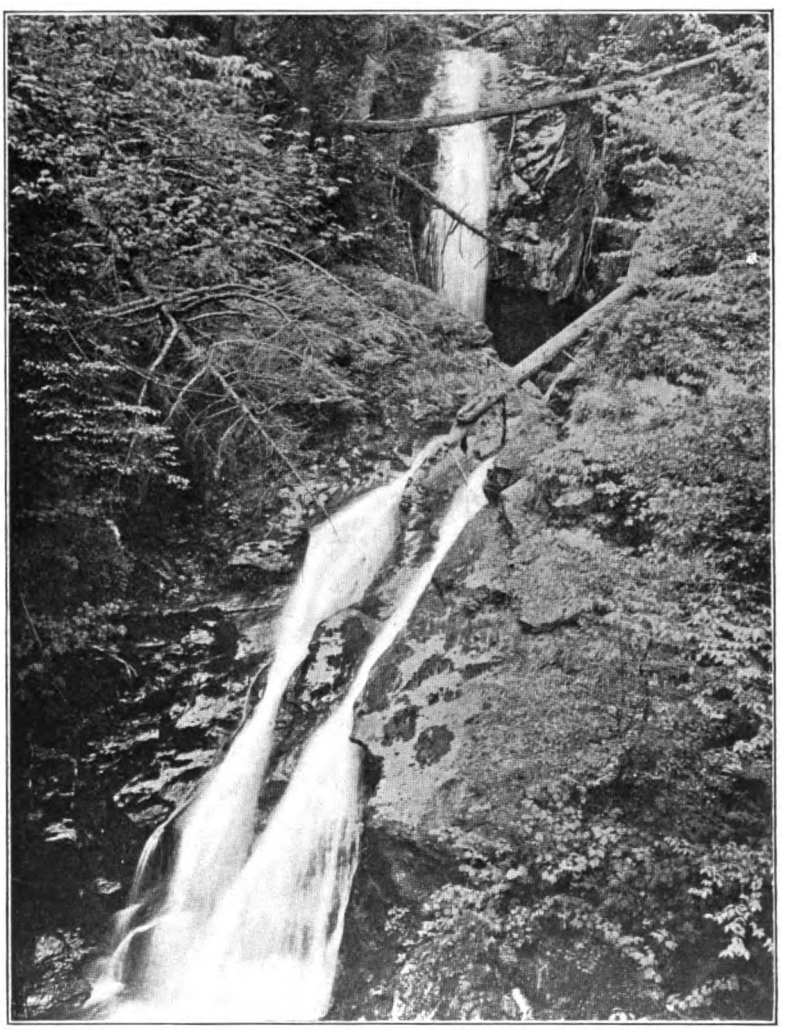
TOUR NO. 51.



Tour No. 51, starting from Bridgeport, Conn., and with night stops at Poughkeepsie, N. Y., and Lake Hopatcong, N. J., offers a delightful trip among hills and dales without taxing the powers of the car unduly.

At Brookfield, north of Danbury, hills, high and steep, characterize the landscape, and this condition continues for some distance. Above New Milford, the hills and mountain ranges recede from the river on either side, and the river bottoms broaden into the most delightful intervales and meadow lands. Beyond New Milford lies Kent, having all the dignity of a respectable New England village, besides a great deal of scenic beauty and fine natural situations that are not always found in connection with dignified and eminently respectable towns, even in New England.

West Cornwall is the gateway to a wild and picturesque region traversed by the Cornwall range. Curiously tumbled about, rocky and broken, are these mountains and they possess a charm all their own. Lime Rock is sufficiently suggestive of the region in its neighborhood, for here ledges of the whitest limestone, seamed with lines of gray and black, show gleaming in the sunlight, or as white and gray patches among the shadows of the woods.

At Falls Village, the Housatonic takes a series of tumbles from a primeval rock dam, extending almost across the river bed, as a beginning of the descent, thence over a succession of natural terraces, alternating at no great distance, rushing and foaming and boiling among thickly strewn boulders, until it has fallen 130 feet. The falls not only form one of the most picturesque scenes on the whole trip, but furnish power for extensive manufacturing operations.

From Canaan the tour turns eastwood, past the iron mines in Salisbury and the ore hills beyond settled by Huguenot refugees from France in 1683. Many of its old stone houses, with high, steep pitched roofs, remain today much the same as when they were erected over 200 years ago. The surrounding country, with its smiling, well tilled fields and vine clad hillsides, still bears the imprint of the thrifty Frenchmen who were the first to reclaim it from the wilderness.

Sage's Ravine, Between Great Barrington and Lakeville, Conn.

Lakeville, down into the Hudson valley at Poughkeepsie, the first night stop. This is the seat of Vassar College and the centre of a vast touring country, up and down both sides of the Hudson.

Crossing the river the second day's itinerary enters some of the interesting touring country about New York City. New Paltz, on the west bank of the Wallkill, was

Napanoch is a favorite resort of artists, who take pleasure in transferring to canvas the many charming views of the surrounding country. Ellenville is located right under the shadow of the Shawangunk mountains, which rise to a height of 2500 feet and are crowned with castellated, massive bluffs, stretching for miles along their crest. Summits-

Digitized by Google

Chestnut Point at the Head of Lake Hopatcong, N. J.

ville overlooks the entire length of the Mamakating valley.

Wurtsboro was first settled by the Dutch in 1660, and is surrounded by a number of lakes which furnish excellent fishing grounds. The same may be said for Westbrookville and Cuddebackville, on the way to Port Jervis, Milford, Penn., and Dingman's Ferry. New Jersey is entered at Layton and from that point to Lake Hopatcong, the night stop, the road lies through much picturesque country with the Blue Ridge and Pocono mountains of New Jersey and Pennsylvania ever in sight.

Lake Hopatcong is a favorite resort among the hills of northern New Jersey, and is noted not only for its beauties and pleasures, including excellent fishing, but for its healthfulness as well. Its high altitude, 1000 feet above sea level, is very invigorating. The lake is 11 miles long and from .25 to 3.5 miles wide.

Boonton is located near the large Jersey City reservoir which is about three miles long. The route now follows the old Morris and Essex canal, and many beautiful views are unfolded on the way. Paterson is a manufacturing city, the water power being furnished by the Passaic falls, about 50 feet high, inside the city limits.

The route now turns northward to Suffern, thence to the Hudson, over Vacation Tour No. 3. Leaving the Hudson at Tarrytown, the way leads across the state to Port Chester and enters Connecticut at Greenwich. The remainder of the distance into Bridgeport is over the shore line, by way of Stamford, Darien, Norwalk, Westport and Fairfield.

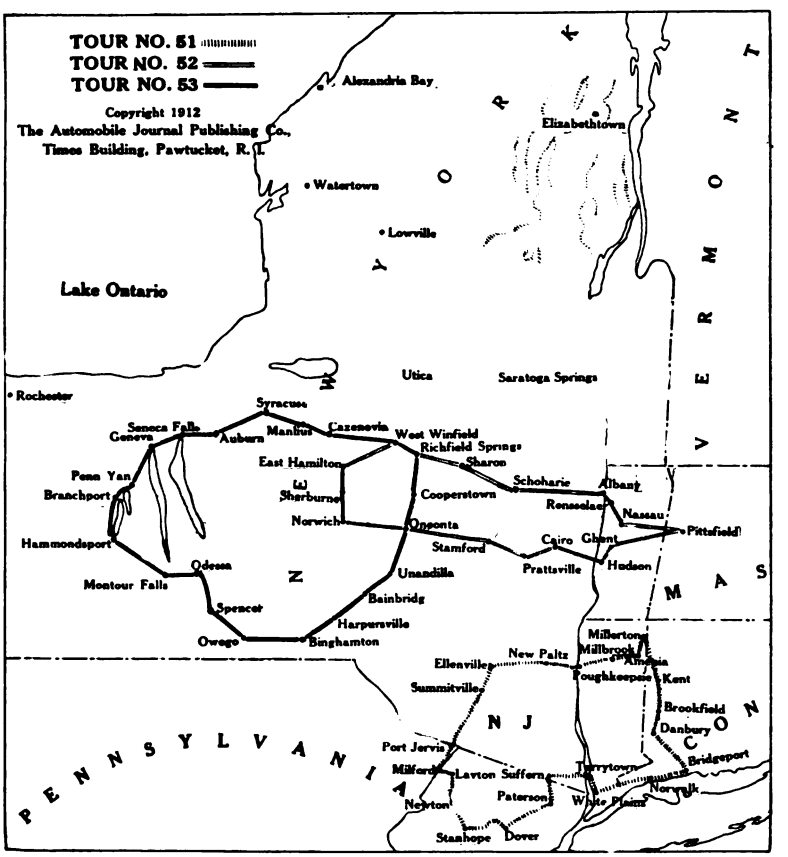
TOUR NO. 52.

The first part of Tour No. 52 which starts at Pittsfield, Mass., and has night stops at Richfield Springs and Stamford, N. Y., may be used in connection with Tour No. 23 in connecting New England points with Transcontinental Tour A at Albany. It also connects Vacation Tours 2 and 3.



Shaker Village is the headquarters for the Lebanon Shakers. At New Lebanon Center are the famous Lebanon springs, which have enjoyed a reputation for efficacy in diseases of the skin and liver. The way then begins to lead down into the Hudson valley, crossing the river at Rensselaer to Albany.

Running along the foothills of the Catskills the tourist reaches Sharon Springs, in the Schoharie valley, 1100 feet above the sea level and surrounded by high hills. These springs are to the North what the White Sulphur springs of West Virginia are to the South. Analyses of the two waters as well as their beneficial results are said to be quite similar. A peculiar feature of Sharon is its mud baths which have been found extremely helpful in cases of rheumatism. Close at hand are the beautiful Tokeharawa falls.

The night stop is at Richfield Springs, near the head of Canadorago lake, with its elevation of 1700 feet; nestled among the mountains of Otsego county, it has every natural advantage to make it a charming place. The surrounding scenery; the wooded hills and cultivated plains form a landscape truly inspiring. The waters, obtained from the celebrated white sulphur springs, have earned for this pretty place a justly celebrated reputation.

After travelling through some of the central New York farming country the second day, visiting the large towns of Norwich and Oneonta on the way, the night stop is at Stamford, in the Catskill country. Oneonta is one of the principal gateways to the Catskills and the route to Stamford is through a decidedly picturesque valley. Stamford is one of the most popular resorts in the Catskill regions and is situated near the source of the Delaware river. Nearby is Mt. Utsayantha, 3365 feet high, which may be reached by road, if desirable.

Grand Gorge has an elevation of 1570 feet and is located between Irish and Bald mountains. Prattsville was named for Col. Pratt, who painted a number of the rocks white, giving them a decidedly curious and weird appearance. Other gorges and wild mountain passes are viewed on the way to Catskill, where the Hudson is crossed by ferry to Greendale and Hudson. Thence the way is back to New England, connecting with Vacation Tour No. 2 for the last portion of the return trip to Pittsfield.

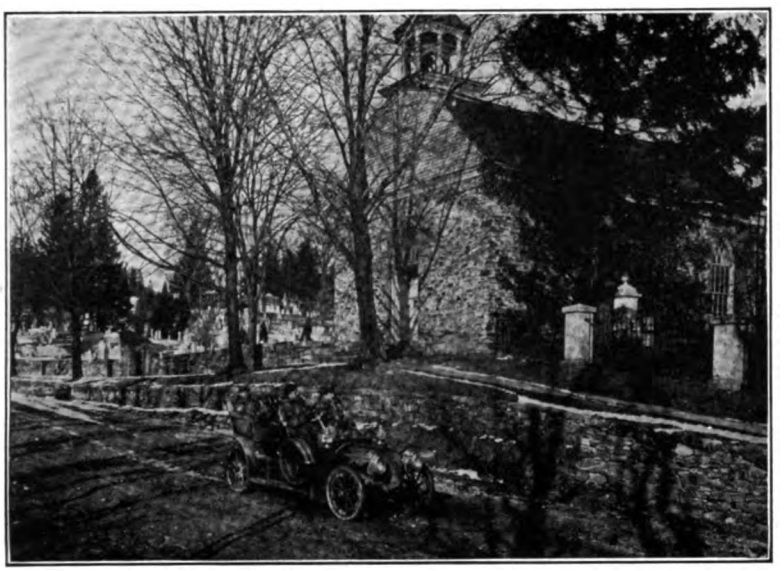
TOUR NO. 53.

For those who delight in the romantic, somewhat off the beaten paths, no section of the East contains more charm than the lake district of central New York. Fortunately the towns in the vicinity early recognized the advantages of cultivating automobile touring, inasmuch as they are not a little neglected by the railroads. Their delightful scenery is such as to merit wide attention on the part of the tourist and the motor car has done much to bring these beauties within easy reach.



The three-day tour outlined below has Binghamton for its starting point, although the itinerary is reached easily from other sections. Motorists from New England, for instance, might join this tour at Richfield Springs, over a slight detour from the main route between Albany and Buffalo. Western tourists have the alternative of making this little trip by departing from the trunk line at Geneva. Binghamton would be the most logical point from which southern visitors would start.

Leaving Binghamton the morning of the first day, the tour follows the valley of the Susquehanna river for some distance, skirting the foothills of the Catskill mountains, particularly as the route nears Oneonta. Numerous

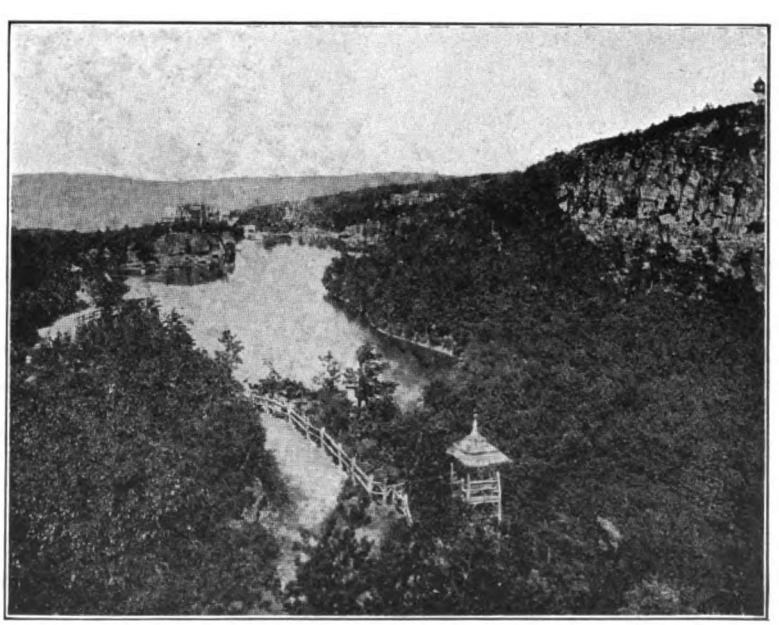
Digitized by Google

Washington Irving's Resting Place in Sleepy Hollow, New York.

small lakes and pretty little trout brooks divide attention with the hills and mountains in the distance, but it is not until Cooperstown is reached that it may be said the lake region is entered.

Cooperstown, the home of James Fenimore Cooper, is on the shore of Otsego lake, and this entire region has been so touched by his genius as to be familiar ground to those who revel in his works. In a park at the centre of the town is a boulder surmounted by the figure of an Indian, which marks the spot where Cooper lived. Fairly good roads encircle the lake, and time might be spent profitably in catching numerous glimpses of its remarkable beauty on this side trip.

The night stop is at Richfield Springs on Canandarago lake, better known by the name of Schuyler. No more inspiring views are to be found anywhere on the American continent than in this vicinity. It is extremely doubtful if the tourist will be satisfied with a night stop at this point, but other lakes still further along offer other charms, and it will be hard for the motorist to decide just how much time he may allow himself away from home.



The second day's run enters the Mohawk valley, which is followed into Syracuse, not forgetting to mention Cazenovia, a summer resort of considerable repute situated at the foot of a pretty little lake, which empties into Lake Oneida. Time should permit of taking the pleasing little drive about the shores of this sheet of water. After leaving Syracuse, the main route through central New York is followed for a time, practically into Geneva.

Auburn is on Cayuga lake, which may be skirted if it is desired to extend the tour beyond the three days originally planned. This additional mileage will amply repay, as there are many attractions within easy driving distance. Among these may be mentioned Taghanic falls, at the end of a gorge a mile long and 400 feet deep, where the water takes a sheer drop of 250 feet, higher than Niagara.

Geneva is on Seneca lake, which is reached along the banks of the Seneca river from Seneca Falls, after the Montezuma marshes are passed. This lake is considered the most picturesque of the entire group. It is 38 miles long and from two to six miles wide. Steamers may be taken from Geneva to Watkins, if more time is desired for exploring portions of this district. This route anticipates making Penn Yan, on the shores of Keuka lake, the night stop.

Penn Yan is some 900 feet above the level of Seneca lake, and the road from Geneva is a gradual rise, although it can be made practically all of the way on high speed. Possibly it will be well to continue the journey about two miles south of the city itself for the night stop, as here opportunity is afforded to spend the night on the banks of the lake in a new hostelry, which is famed throughout this district for treatment accorded to motorists.

The third day finds the tourist between the two arms of the lake on his way to Bluff Point, 700 feet above the surface of Keuka, which is 900 feet above the level of Seneca. From this elevation

Lake Mohonk, Where the Peace Conferences Are Held, in the Catskills.

Digitized by Google

an extensive view of the surrounding country is obtained, a clear day affording glimpses of four counties. Looking down upon the lake itself, the visitor is surprised to see what appears to be a toy steamboat, and finds it hard to believe it is one of the large lake steamers with a capacity of 400 to 500 people. Immediately below a reflection of glistening oars and little specks on the water, not unlike a school of minnows, prove to be full sized rowboats filled with fishing parties.

Watkins Glen, an Imposing Natural Wonder.

Keuka lake is in the centre of the rich grape country, and the district is famed for its wines and champagnes. None the least of the pleasing pictures from Bluff Point are the vine clad, ravine broken hills, many of which will be visited on the trip from Bluff Point to Hammondsport, but first the tourist must turn north to get around the lower end of the other arm of the lake at Branchport.

From Branchport to Hammondsport is a steady drop, with the lake level lost to view. On either side are to be seen the vineyards, and at Hammondsport, 300 feet above the surface of the lake, the tourist finds a view to the northward, which for breadth, distance and picturesque beauty is to be equalled nowhere.

Hammondsport is the home of Glenn H. Curtiss, and his plant for the manufacture of aeroplanes. A visit to this industry will offer a pleasing diversion, as many of the Curtiss aviators are continually testing out new machines in the vicinity of the city. Recent activities have been in connection with the perfection of the hydroplane, and the waters of Keuka lake are utilized by the United States naval students of aviation as well as the Curtiss instructors in exploiting the latest inventions.

Turning eastward again, the way leads past Lake Wauneta, between Weston and Wayne, and then on to Watkins, at the southern end of Seneca lake. Here, time should be spent in visiting the famous Watkins Glen, one of the most remarkable of nature's wonders, now a state park.

During the ages the small stream, in making its way from the hills to Seneca lake, has worn a deep gorge in the soft rock at this point, until now the water tumbles over a series of gorges, some of them nearly 200 feet deep. Sometimes the cut is no more than 10 feet wide, while at others it broadens out into vast amphitheatres, in which the echo of the tourist's voice sounds wierd and almost supernatural. This chasm penetrates the hills for three miles, winding and curving abruptly, and presenting an almost infinite variety of rocky and picturesque scenes.

The return to Binghamton is over the divide into the Susquehanna valley. The country is still picturesque, although by no means as romantic in its beauty as that which has occupied the tourist for the greater portion of three days. The road is excellent, while not of macadam, and good time can be made, so that if desired, the homeward journey may be delayed long enough to enjoy fully the interesting points on the way. Splendid views of the Susquehanna are afforded as the tourist approaches Owego and from that point the river is followed into Binghamton.

TOUR NO. 61.

Tour No. 61 has Binghamton, N. Y., as its starting point with Delaware Water Gap, Penn., and Goshen, N. Y., as the night stops. It covers northeastern Pennsylvania, northern Jersey and the Wallkill valley of New York, and makes a number of connections with other tours outlined herein.

Crossing the Pennsylvania line, the first town of importance is Hallstead, rich in Indian traditions. The tiny gravel point in the middle of the Susquehanna at this place was once an island, around which the savages used to race in canoes, the prize for the swiftest being the honor of chief of the funmakers for the day. High upon the cliffs above the river, at a point seemingly inaccessible, was once a picture of a red chief in full war paint. The picture gradually faded, but the red remained, giving to the cliff its present name of Red Rock.

Scranton is situated in a pocket among the mountains and on the banks of the beautiful Lacka-

In the Midst of Central New York's Lakes: Left, Beautiful View in the Vicinity of Richfield Springs; Right, Inland Dotted Waters Vying with Mountains in Catskill Foothills.

Digitized by Google

wanna. The outskirts of the city are marked by a number of culm banks and coal breakers, bearing eloquent testimony of the unceasing search for coal.

The tour then begins the climb to Mt. Pocono, and descends to Stroudsburg, the views presenting panoramas of waving pine, mountain laurel and rhododendron, which grows in endless profusion along the walks and driveways. The night stop is at Delaware Water Gap.

The second day's run enters New Jersey, climbing into the Schooleys mountain region, and then turning northward into the valley of the Wallkill. The roads will be found to be good for the most part, with occasional stretches of macadam. The views of mountains on either side, combined with those of the fertile valley, make this an ideal trip. The night stop is Goshen, N. Y., in the midst of a famed stock breeding country.

Middletown is the centre from which the famous Orange county milk and butter is shipped to New York City and other points. Highview is located on the eastern slope of the Shawangunk mountains, and as its name implies, affords a broad and extensive view of the valleys and the Catskills. Mamakating is on the other slope of the same mountain, and near this is Mamakating park on the banks of the lake by the same name, a beautiful body of spring water covering 100 acres.

Connection is made with Tour No. 51 at Wurtsboro, by which it is possible to reach New England points reversing Tour No. 61 to Wurtsboro and reversing Tour No. 51 to the Hudson river and beyond. Within 1.5 miles of Rock Hill are six lakes, besides numerous trout streams, making this town deservedly popular as a fishing ground.

At Ferndale the road crosses the east branch of the Mongaup river, the scenery around which is wild. Liberty falls, nearby, have an added interest. Lake Ophelia at Liberty is a pretty sheet of water, and the highlands about this region form a chain of foothills extending to the Catskills, 20 to 40 miles distant, although in plain view, from the broad plateau on which the town is located.

Parksville is in the heart of an immense trout country. Livingston Manor, at the junction of the Willowemoc and Little Beaverkill rivers, is situated in a wide valley, and the surrounding hills lend much to its attractions. Among the points of interest are the celebrated Eastman, Marguerite and Woolsey falls, near the highway.

It is said to be worth 10 years of city life to spend a week among the trout haunts in the vicinity of Cook's falls. At East Branch the Beaverkill pours its spring waters into the Delaware, and bass fishing is said to be the best in the state. The remainder of the distance into Binghamton is by way of Hancock, Rood's Creek, Deposit, Damascus and Windsor.

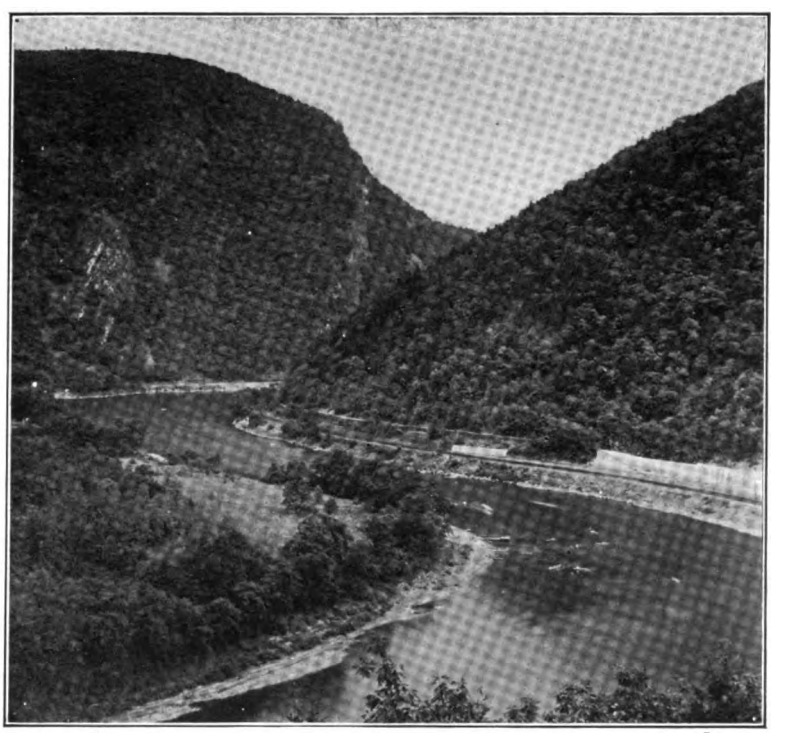
TOUR NO. 62.

Tour No. 62 leaves Harrisburg, Penn., for a visit to Eagles Mere and return by way of Easton. It connects with Vacation Tour No. 2 at Wilkesbarre and thus affords an opportunity for motorists in central Pennsylvania to connect with tours from that point to New England and the other itineraries listed in this section.

The first day's run is through the Blue mountain region, very nearly to Williamsport, and thence across the coal country to the famed Eagles Mere. Some care should be taken in driving through the small towns in the coal district, because of the narrow streets and the abundance of children. The views on the way are excellent and the conditions at Eagles Mere amply repay for the difficulties encountered in reaching it.

The beautiful "Lake of the Eagles" is situated 2200 feet above sea level, and is embedded like a brilliant emerald among the virgin forests of northern Pennsylvania. It is 1.5 miles long and one mile wide, and in many places 60 feet deep. Excellent opportunity for bathing is afforded, the beaches being covered with clean, sloping white sand. Eagles Mere park is a beautiful grove of about 400 acres, a greater part of which is primeval forest, located at the north end of the lake.

After leaving Wilkesbarre, Vacation Tour No. 2 is followed for a few miles, branching off for Easton and Weygadt mountain, with its celebrated Shawnee spring. The view from this point is decidedly commanding, and a mountain park affords excellent drives. Much time can be spent profitably in this vicinity.



As laid out this route takes the short line between Easton and Bethlehem over the hills, where some excellent views are obtained. If the tourist reaches this point in wet weather, however, he is earnestly advised to take the longer route by way of Nazareth and Bethlehem, which is macadam all of the way.

Near Kutztown is a famous crystal cave. Reading is located on a narrow plain between the Schuylkill river, and the Penn and Neversink mountains. Penn mountain may be ascended by a switchback railroad, and affords a splendid view of the surrounding country. The White Spot, a piece of sandstone lying on the Laurentian rock, is another favorite point of view. The remainder of the route to Harrisburg is over good road, the chief objection being the numerous toll gates and the frequent stops occasioned thereby.

TOUR NO. 63.

Tour No. 63, outlined as a three-day trip from Trenton, N. J., to Mauch Chunk and Scranton, Penn., passes the point on the Delaware river crossed by Gen. Washington on his memorable trip Christmas night, 1776, previous to the battle of Trenton. The tour itself crosses the river at Stockton, by means of a long covered bridge, and turns right on to a narrow, rocky road along the cliff. The entire road into Easton is far from being good, but the views are splendid.

Reaching Allentown by way of Bethlehem, the way leads toward Mauch Chunk, over mountainous roads for some distance. A night stop is made at Mauch Chunk, affording ample opportunity to visit the mountain and take a ride on the switch-back railroad.

The mountain is in itself an island in the Lehigh river, the top being 900 feet above the river. The car is hauled up the side of this mountain by cable, along an incline of one in three. While this climb is but 664 feet, the car travels downward some 18 miles solely by the force of gravity, making one ascent of 462 feet on the trip, and returns to the town at the end of about an hour. A short distance from this mountain is Glen Onoko, a national park, and a visit to Mauch Chunk without stopping at this place of winding paths, splashing waters and windy chasms, would be decidedly incomplete.

On the way to Wilkesbarre the second day, mountain views are quite in order. At White Haven, is located Sunnyrest Sanitarium, which has an elevation of 1200 feet, and the cold bracing air of the Blue mountains is said to work wonders in stimulating the appetite, and insuring sound sleep. On one of the offshoots of the Alleghenies is Nescopec mountain, on the eastern spur of which is Glen Summit, with its famous springs, celebrated for its pure water and excellent air.

The third day finds the tourist on the itinerary for Tour No. 61 for a time, or until after leaving Delaware Water Gap. From this point back to Trenton several small towns are visited, most of them furnishing excellent views of the Delaware and Musconetcong valleys, or both. Washington is a particularly pleasing little town, with its old houses, its shady streets and splendid landscapes.

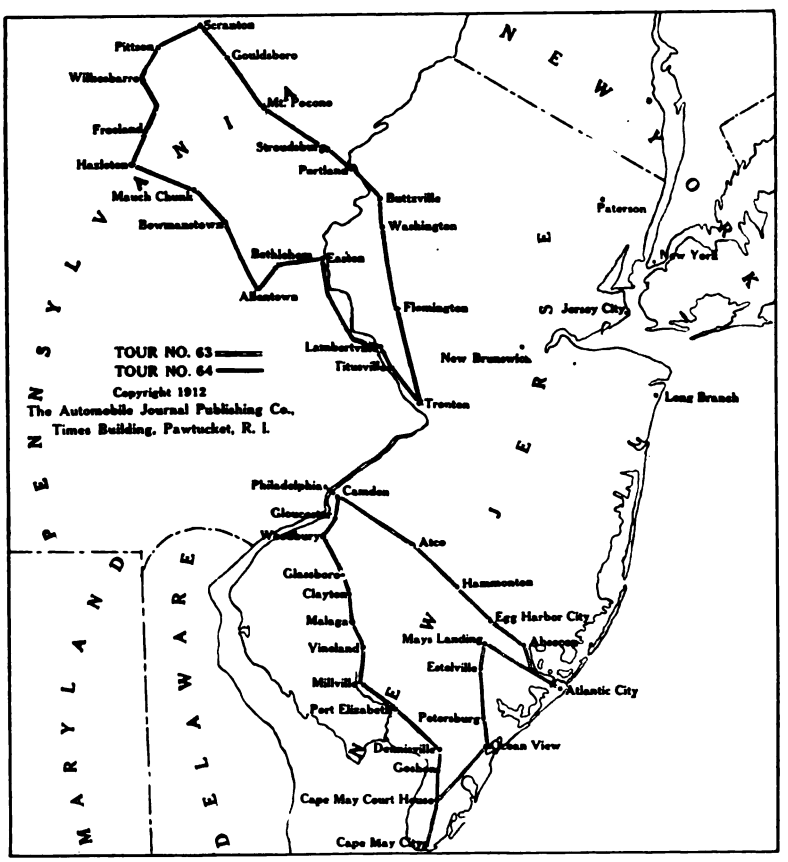
Atlantic City Possesses One of the Best Known Bathing Beaches and Recreation Spots in America.



Digitized by Google

TOUR NO. 64.

Tour No. 64 is planned to connect Philadelphia with two well known summer resorts on the south Jersey shore. It is anticipated that tourists from other parts of the region covered in this series will desire to include either one or both of these in their itinerary, particularly as New Jersey now encourages touring within its borders. The night stops are Cape May and Atlantic City.

Care should be taken in traversing this end of New Jersey, particularly during the summer season, because of the numerous railroad crossings and the frequent train service. The second day's run is from cool Cape May, as it is termed, to Atlantic City, one of the best known convention cities, as well as a famous watering place.

The location of Atlantic City is particularly advantageous. Built upon an island lying seven miles out from the mainland, it is entirely surrounded by salt water. Elegant displays of art and bric-a-brac, magnificent hostelries and all forms of legitimate amusements are to be found side by side, fronting the greatest esplanade in the world, called the board walk.

The first day's route lies along the shores of Delaware bay to the tip end of New Jersey, with its excellent yachting harbor at Cape May. Here, it is claimed that surf bathing is the best and safest in America. A fine ocean boulevard, 60 feet wide, extending to Sewell's Point, provides a matchless drive, which at no point is more than 100 feet from high tide for a distance of five miles. Public pavilions are maintained on the ocean side of the board walk and the city furnishes a band which gives open air concerts daily, morning, noon and evening.

The return to Philadelphia is across the state in almost a straight line. The roads are much better than over the first day's run.

TOUR NO. 64.

Philadelphia—Cape May City, N. J.—Atlantic City, N. J.—Philadelphia.

Three Days, 216 Miles.

First Day, Philadelphia to Cape May City, N. J., 90.2 Miles.

The Automobile Journal feels confident that the motoring public will agree that the collection of tours presented in this American section covers the richest touring ground in the country. Studied in connection with the directory of touring information in the front of the magazine, these itineraries will supply data more than sufficient to satisfy the most exacting for a single season. In fact, this number will have a permanent value and will be retained as a book of reference throughout the entire year. Additional information, covering any specified territory may be obtained by addressing the Touring Department of The Automobile Journal.

Lights—Two front; one red rear, visible 50 feet; one-half hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed—Reasonable and proper; maximum 30 miles per hour for .25 mile.
Local Ordinances—Prohibited.

ARIZONA.

(No law. Bill pending.)

ARKANSAS.

(Act of 1911.)

Registration—Annual, Secretary of State, Little Rock.
Fees—$5.
License—Chauffeur, $1.
Non-Residents—Exempt.
Lights—Two front; one red light rear; front visible 200 feet; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and sufficient.
Speeds — Reasonable and proper; closely built-up sections, 15 miles per hour for .125 mile; outside, 20 miles per hour for .25 mile; corners, curves and in obstructed traffic, six miles per hour.
Local Ordinances—Prohibited, except in parks, special speedways, etc.

CALIFORNIA.

(Act of 1905, amended 1907.)

Registration—Perpetual, Secretary of State, Sacramento.
Fees—$2.
License—Chauffeur, $2.
Non-Residents—Exempt, temporarily.
Lights—Two forward; one red rear; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and efficient.
Speed—Reasonable and proper; closely built-up, one mile in six minutes; elsewhere in cities and towns, one mile in four minutes; outside, one mile in three minutes.
Local Ordinances—Permitted as to speed of all vehicles.

COLORADO.

(No law, but cities and towns may pass ordinances requiring registration and license.)

CONNECTICUT.

(Act of 1911.)

Registration—Annual, Secretary of State, Hartford.
Fees—50 cents a horsepower; pro ratio after March 1.
License—Operator, $2.
Non-Residents—Exempt.
Lights—Two forward, visible 200 feet; one red rear, illuminating number plate; one-half hour.
Warning Signal—Bell or horn.
Brakes—Two sets, one on driving wheels.
Muffler Cut-Out—Prohibited between 9 in the evening and 6 in the morning.
Speed—Reasonable and proper; curves, crossing, etc., 10 miles per hour; outside cities, 25 miles per hour for .25 mile; passing street cars, three miles per hour.
Local Ordinances—Prohibited.

DELAWARE.

(Act of 1909, amended 1911.)

Registration—Annual, Secretary of State, Dover.
Fees—$5.
License—Operator, $5.
Non-Residents—United States, reciprocity; foreign nation, special license.
Lights—One forward, visible 200 feet; one red rear; one hour.
Warning Signal—Horn, bell or other device.
Brakes—Good and sufficient.
Tire Chains—Prohibited on certain surfaces.
Speed—Closely built-up, one mile in five minutes; elsewhere, one mile in three minutes.

DISTRICT OF COLUMBIA.

(Act of 1906 and police regulations.)

Registration—Automobile Board, Washington.
Fees—$2.
License—Driver, $2.
Non-Residents—Reciprocity.
Lights—Two forward; one red rear; one-half hour.
Warning Signal—Bell, gong or horn; unnecessarily loud or discordant alarm prohibited.
Muffler—Required.
Speed—Between intersecting street, 12 miles per hour; parks, 15; across streets, eight; around corners, six.
Special Regulations—Unlawful to drive on certain streets. Ask for police regulations.

FLORIDA.

Registration—Secretary of State, Tallahassee.
Fees—$2.
License—Chauffeur, $2.
Non-Residents—Exempt 30 days.
Lights—Two, from sunset to sunrise.
Warning Signal—Bell, horn or whistle.
Speed—Reasonable and proper; curves, crossings, etc., four miles per hour.

GEORGIA.

(Act of 1910.)

Registration—Secretary of State, Atlanta.
Fees—$2.
Non-Residents—Exempt 30 days.
Lights—One front, visible 100 feet; one red rear, illuminating number plate; one hour.
Warning Signal—Bell, horn, gong or other device.
Speed—Reasonable and proper; curves, crossings, etc., six miles per hour.
Local Ordinances—Permitted, must not conflict.

IDAHO.

(No law.)

ILLINOIS.

(Act of 1911.)

Registration—Annual, Secretary of State, Springfield.
Fees—25 hp., $4; 25-35, $6; 35-50, $8; over 50, $10; electrics, $5.
License—Chauffeur, $5.
Non-Residents—Exempt, 60 days.
Warning Signal—Bell, horn or other device.
Brakes—Good and sufficient.
Speed—Reasonable and proper; closely built-up, 10 miles per hour; residential portions, 15; elsewhere in cities and towns, 20; outside, 25.
Local Ordinances—Prohibited except as to traffic regulations.

INDIANA.

(Act of 1911.)

Registration—Perpetual, Secretary of State, Indianapolis.
Fees—$1.
Non-Residents—Exempt.
Lights—After dark.
Warning Signal—Bell, horn or other device.
Speed—Reasonable and proper; closely built-up, eight miles per hour; elsewhere in cities and towns, 15; outside, 20.
Local Ordinances—Permitted, but speed limit must not be reduced.

IOWA.

(Act of 1911.)

Registration—Annual, Secretary of State, Des Moines.
Fees—20 hp., $8; over 20, 40 cents a horsepower; electrics and steam, $15.
Non-Residents—Exempt.
Lights—Two front; one red rear, visible 50 feet, illuminating number plate; one-half hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed—Careful and prudent manner; maximum 25 miles per hour.
Local Ordinances—Permitted as to speed limitation, but in no case less than one mile in six minutes.

KANSAS.

(No law. Bill pending.)

KENTUCKY.

(Act of 1910.)

Registration—Annual, Secretary of State, Frankfort.
Fees—25 hp., $5; 25-50, $10; over 50, $20.
Non-Residents—Exempt.
Lights—Two forward, visible 200 feet; one red rear; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and sufficient.
Speed—Reasonable and proper; closely built-up, 10 miles per hour for .125 mile; residential portions, 15 miles per hour for .125

Brakes—Adequate.
Muffler Cut-Out—Prohibited in towns and cities.
Speed—Reasonable and proper; thickly settled sections, 12 miles per hour; outlying districts, 18; open country, 25.
Local Ordinances—Permitted, but signs must be posted conspicuously.

MASSACHUSETTS.

(Act of 1909, amended 1912.)
Registration—Annual, State Highway Commission, Boston.
Fees—20 hp., $5; 20-30, $10; 30-40, $15; 40-50, $20; over 50, $25. Half-rate after Sept. 30.
License—Owners and chauffeurs, $2.
Non-Residents—Exempt 10 days.
Lights—Two forward, visible 200 feet; one red rear, illuminating number, visible 60 feet; one-half hour; all vehicles must display lights.
Warning Signal—Bell, horn or other device.
Brakes—Over 10 hp., two sets.
Speed — Reasonable and proper; thickly settled or business portion, 15 mph for .125 mile; outside, 20 mph for .25 mile.
Local Ordinances—Permitted.

MICHIGAN.

(Act of 1909.)
Registration—Annual, Secretary of State, Lansing.
Fees—$3.
License—Chauffeur, $2.
Non-Residents—Exempt.
Lights—Two front, visible 200 feet; one red rear, illuminating number plate; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed—Reasonable and proper; business portions of cities and towns, 10 miles per hour; elsewhere in cities and towns, 15; open country, 25.
Local Ordinances—Permitted as to speedways, parks, etc.

MINNESOTA.

(Act of 1911.)
Registration—Triennially, Secretary of State, St. Paul.
Fees—$1.50.
License—Chauffeur, $3; renewal, annually, $2.
Non-Residents—Exempt, 30 days.
Lights—Two front, visible 200 feet; one red rear, illuminating number plate; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed — Reasonable and proper; closely built-up, 10 miles per hour for .125 mile; residential portions, 15 miles per hour for .125 mile; outside, 25 miles per hour for .25 mile; congested traffic, six miles per hour.
Local Ordinances—Prohibited.

MISSISSIPPI.

(Act of 1912.)
Registration—Annual, State Auditor, Jackson.
Fees—25 hp., $5; 25-40, $15; 40-50, $20; over 50, $25.
Non-Residents—Exempt, 30 days.

MISSOURI.

(Act of 1911.)
Registration—Annual, Secretary of State, Jefferson City.
Fees—12 hp., $2; 12-24, $3; 24-36, $5; 36-48, $7; 48-60, $8; 60-72, $10; over 72, $12.
License—Chauffeur, $1.50.
Non-Residents—Exempt 20 days.
Lights—Two front, visible 200 feet; one red rear.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed—Careful and prudent; maximum, 25 mph for .25 mile.
Local Ordinances—Prohibited, except cities and towns may require annual license tax from owners residing therein.

MONTANA.

(No law.)

NEBRASKA.

Registration—Annual, Secretary of State, Lincoln.
Fees—$2.
Non-Residents—Exempt 30 days.
Speed—Reasonable and proper; cities and towns, 12 mph; outside, 25.

NEVADA.

(No law.)

NEW HAMPSHIRE.

(Act of 1911.)
Registration—Annual, Secretary of State, Concord.
Fees—15 hp., $10; 15-30, $15; 30-40, $20; 40-50, $25; 50-60, $30; over 60, $40. Half-rates after Oct. 1.
License—Private operator, $3; professional chauffeur, $5; renewals, $1.
Non-Residents—Exempt 10 days; special rate, half-fees, for months of July, August and September.
Lights—Two front, visible 200 feet; one red rear, illuminating number plate to be visible 50 feet; one-half hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed — Reasonable and proper; thickly settled portions, 15 mph; elsewhere, 25; curves, crossings, etc., 10.

NEW JERSEY.

(Act of 1906, amended 1912.)
Registration—Annual, Commissioner of Motor Vehicles, Trenton.
Fees—10 hp., $4.50; 11-29, $7.50; 30 and over, $15. Half-rate after Sept. 1.
License—Operator, $2 or $4, according to horsepower of machine.
Non-Residents — Reciprocity, 15 days.
Lights—Two front, visible 250 feet; one red rear, one-half hour. All vehicles must show light at night.
Warning Signal—Suitable device.
Brakes—Two sets.
Muffler Cut-Out—Prohibited in cities and towns, and elsewhere within 200 feet of horsedrawn vehicle.
Speed — Reasonable and proper; curves and corners, one mile in seven minutes; cross roads, one mile in four; closely built-up sections, one in five; elsewhere, 25 mph.
Local Ordinances—Prohibited.

NEW YORK.

(Act of 1910, amended 1911.)
Registration—Annual, Secretary of State, Albany.
Fees—25 hp., $5; 25-35, $10; 35-50, $15; over 50, $25. Half-rate after Aug. 1.
License—Chauffeur, $5.
Non-Residents—Full reciprocity.
Lights—Two front, visible 200 feet; one red rear, illuminating number plate, visible 50 feet; one-half hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Speed—Careful and prudent; maximum, 30 mph.
Local Ordinances—Prohibited.

NORTH CAROLINA.

(Act of 1909.)
Registration—Annual, Secretary of State, Raleigh.
Fees—$5.
Non-Residents—Exempt.
Lights—Two front; one red rear, visible a reasonable distance; one-hour.
Speed — Reasonable and proper; business portions of cities and towns, eight mph; other parts of cities and towns, 12; outside, 25.
Local Ordinances—Permitted as to parks, etc.

Lights—One or more forward; one red rear, illuminating number; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Adequate.
Muffler Cut-Out—Prohibited at all times.
Speed — Reasonable and proper; closely built-up sections, 15 mph; outside, 25.
Local Ordinances — Prohibited, except exclusion from certain streets, which must be posted.

SOUTH CAROLINA.

(Act of 1906.)

Registration — Clerk of County Court.
Fees—$1.
Non-Residents—No special provision.
Speed—Maximum 15 mph.

SOUTH DAKOTA.

(Act of 1911.)

Registration—Annual, Secretary of State, Pierre.
Fees—$3.
Non-Residents—Exempt temporarily.
Lights—At least two front, visible a reasonable distance; one red rear, showing registration number; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and efficient.
Muffler Cut-Out—Prohibited in cities and towns.
Speed — Reasonable and proper; cities and towns, 10 mph; outside, 30 mph.
Local Ordinances—Prohibited.

TENNESSEE.

(Act of 1905.)

Registration — Perpetual, Secretary of State, Nashville.
Fees—$2.
Non-Residents—No special provision.
Warning Signal—Bell or horn.
Speed—Maximum, 20 mph.
Local Ordinances — May restrict speed.

TEXAS.

Registration—County Clerk.
Fees—Fifty cents.
Non-Residents—No special provision.
Speed—Cities and towns, eight mph; elsewhere, 18.

UTAH.

(Act of 1909, amended 1911.)

Registration—Perpetual. Secretary of State, Salt Lake City.
Fees—$2.
License—Chauffeur, $2.
Non-Residents—Exempt temporarily.
Lights—Two forward; one red rear, illuminating number plate; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and efficient.
Speed — Reasonable and proper; closely built-up sections, one mile in six minutes; elsewhere in cities and towns, one in four; outside, one in three.
Local Ordinances—Prohibited.

VERMONT.

(Act of 1908, amended 1910.)

Registration—Annual, Secretary of State, Essex Junction.
Fees—$1 a horsepower.
License—Operator, $2.
Non-Residents—Full reciprocity.
Lights—Two front, visible 200 feet; one red rear, illuminating number plate, visible 50 feet; 45 minutes.
Warning Signal—Bell, horn, or other device.
Brakes—Adequate.
Speed—City or town, 10 mph; outside, 25.

VIRGINIA

(Act of 1910, amended 1912.)

Registration—Annual, Secretary of the Commonwealth, Richmond.
Fees—20 hp., $5; 20-45, $10; over 45, $20.
License—Chauffeur, $2.50.
Non-Residents—Exempt, two periods of seven days each.
Lights—One front, visible 100 feet; one red rear, illuminating number plate; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and sufficient.
Speed—Cities and towns, 12 mph; outside, 20.

WASHINGTON.

(Act of 1911.)

Registration—Annual, Secretary of State, Olympia.
Fees—$2.
Non-Residents—Exempt.
Lights—One front; one red rear, illuminating number; hours of darkness.
Warning Signal—Bell or horn.
Brakes—Good and efficient.
Muffler Cut-Out — Prohibited in cities and towns.
Speed—Thickly settled districts, one mile in five minutes; outside, one in 2.5.
Local Ordinances—Prohibited.

WEST VIRGINIA.

(Act of 1911.)

Registration—State Auditor, Wheeling.
Fees—$10.
License—Chauffeur, $2.
Non-Residents—Full reciprocity.
Lights—Two front; one red rear; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Good and sufficient.
Speedometer—Required.
Speed — Reasonable and proper; closely built-up, 10 mph; elsewhere in cities and towns, 15; outside, 20.
Local Ordinances—Permitted.

WISCONSIN.

(Act of 1911.)

Registration—Annual, Secretary of State, Madison.
Fees—$5.
Non-Residents—Exempt.
Lights — One reasonable bright front; one red rear; one hour.
Warning Signal—Bell, horn or other device.
Brakes—Required.
Speed — Reasonable and proper; cities and towns, 15 mph; outside, 25.
Local Ordinances—Prohibited except as to parks, etc.

WYOMING.

(No law, bill pending.)

TOURING AMONG HIGHLANDS OF ONTARIO.

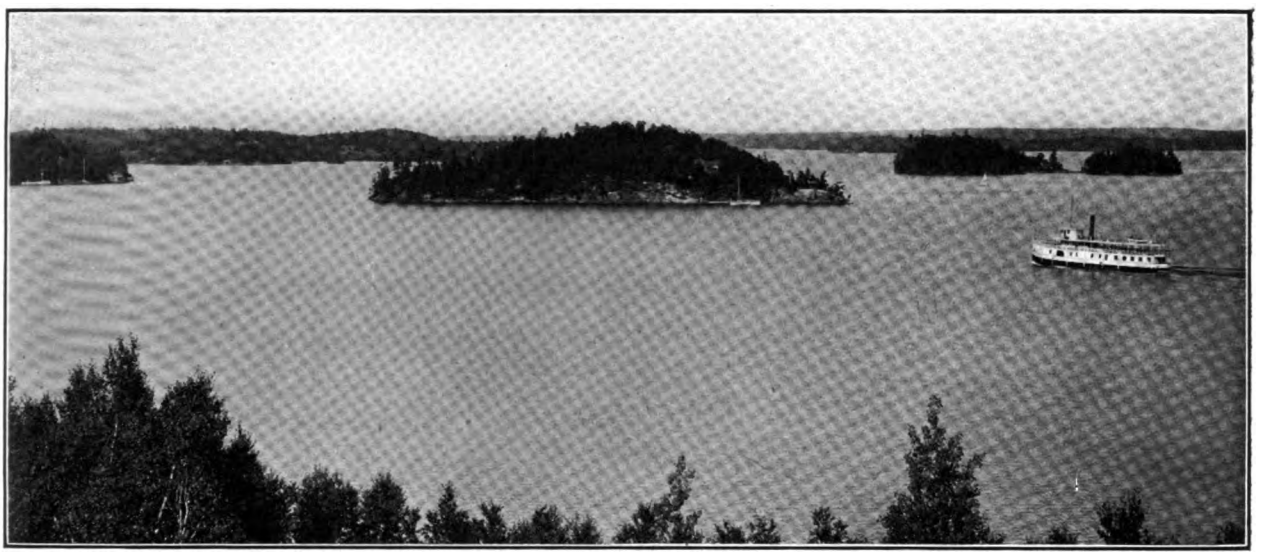
Former Wilderness of Woods, Rocks and Lakes Now Offers Unlimited Possibilites for the Venturesome Motorist---Unimproved Road Conditions More Than Offset by Splendid Combinations of Primitive Scenic Grandeur.

SINCE the advent of automobile touring there has arisen an almost insatiable desire to know more of the beauties of nature, heretofore hidden away among almost impenetrable forests and in otherwise inaccessible places. With the continued increase in the practicability of the motor car, it is possible to utilize this modern method of transportation over ways that only a few years ago presented insurmountable difficulties to those who were forced to depend upon the horse drawn conveyance. Fortunately, interests closely allied with satisfaction of the tourist's demands have recognized in the automobile a valuable recruiting agent, and have expended no little effort in placing the roads leading to their localities in sufficiently good condition to enable their use by motorists under comparatively favorable circumstances, though these ways in many instances are still far from being ideal.

In this manner, the vast section of Canada, north of Toronto and bordering on Georgian bay, the latter an arm of Lake Huron, known as the Highlands of Ontario, has been transformed from a wilderness into a delightful summer playground. The Grand Trunk Railway system traverses this entire district, and through its efforts, many of the old trails have been reconstructed into a semblance of modern dirt roads. Several parties of automobilists have penetrated the forests to the Muskoka lakes, the Lake of Bays and the district of Parry Sound.

Pleasing View of Moon River, Near Bala, on the Shores of Lake Muskoka, Highlands of Ontario.

The Ontario Motor League, with headquarters at 123 Bay street, Toronto, Can., of which E. W. Wilcox is secretary, is authority for the statement that roads are good as far as Orillia, while beyond that point they are very rough and rocky with bad hills in places. Says Mr. Wilcox: "This region is a semi-wilderness of woods, rocks and lakes, so that motoring is difficult, although the scenery is very beautiful." Among those who have taken the trip are J. S. Eaton, William Dobie and J. A. Walker, all of Toronto.



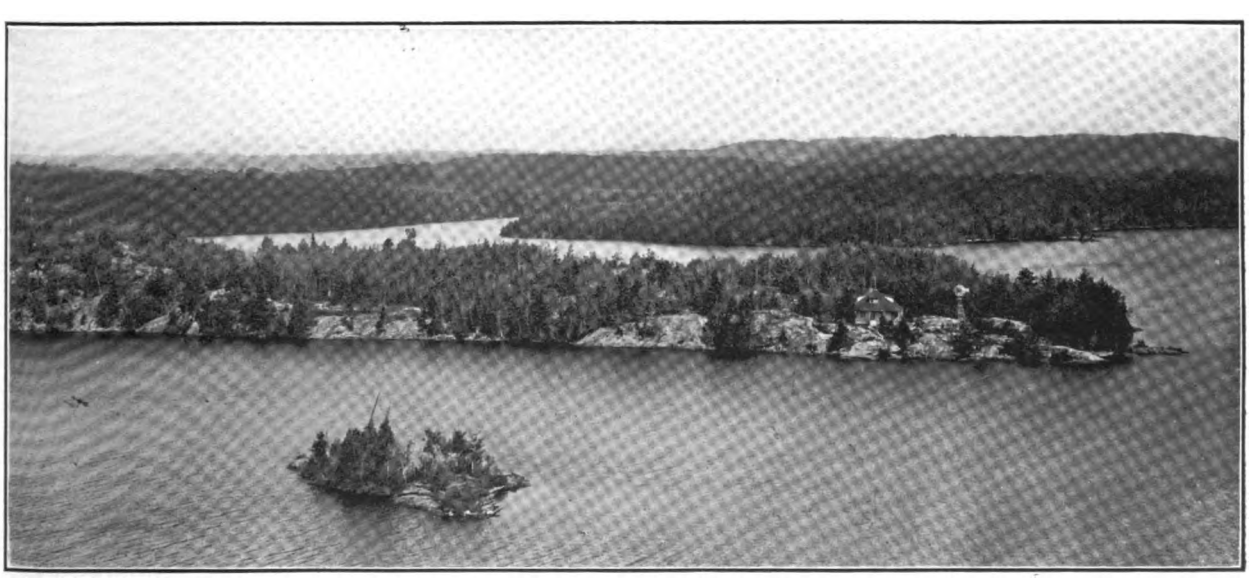
From other sources it is learned that very fair roads exist between Orillia and Gravenhurst, and that motoring tourists have been patronizing this section for a number of years. As early as three years ago, automobiles had reached the Lake of Bays district, and as it was at that time a comparatively new resort and much work has been accomplished in the interim, it is anticipated that motorists will have little difficulty in covering the itinerary outlined below. It should be mentioned, in this connection, however, that the distances given herein are approximated only, from the best information available.

The trip northward from Ontario is most interesting, taking the traveller through a continuous scene of hill and dale, diversified with beautiful lakes and rivers, until the more rugged portion of the country is reached. The prosperous farmer is much in evidence, judging from the well tilled fields and pretentious buildings on every side. Cooks Bay, on Lake Simcoe, is reached between Gilford and Lefroy, and this lake is skirted throughout the remainder of the distance to Orillia.

Allandale is a divisional point on the Grand Trunk Railway and a place of considerable importance in the district. Across the Kempenfeldt bay is the crescent town of Barre, charmingly situated and commanding a splendid view of the lake. Orillia, the night stop, is a thriving centre with some 6000 inhabitants, boasting of many beautiful residences, prosperous stores and manufacturing establishments. It is located on the shores of Lake Couchiching, which has water connection with Lake Simcoe.

The second day's route lies along the shores of Lake Couchiching and between that and Lake St. John, through Atherley, Rama, Longford and Washaga to Severn, Kilworthy and Gravenhurst. The latter is at the foot of Lake Muskoka, the southernmost of the three big lakes which give this the name of the

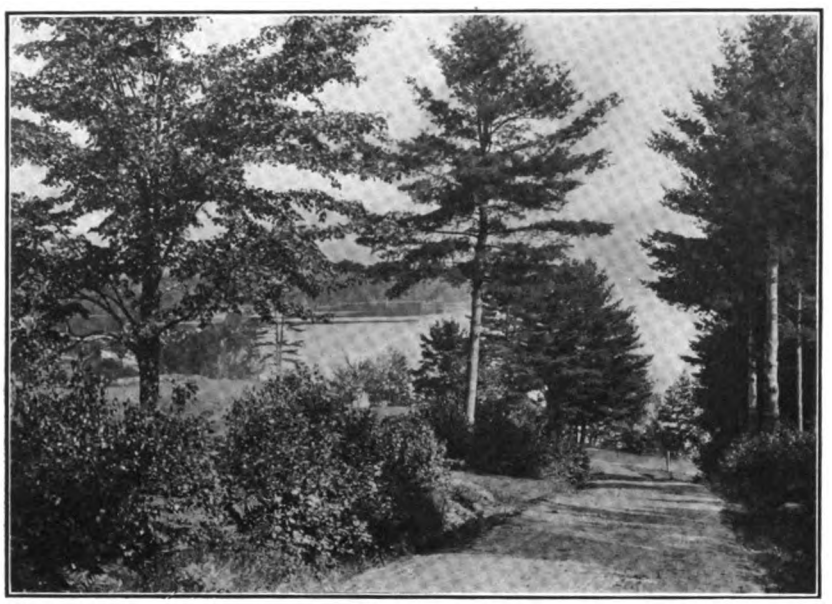
Digitized by Google



Miles of Inland Waterways and Islands Unite Their Charms in the Extensive Touring Country About Lake Rosseau, of the Muskoka Chain.

Muskoka region. The city possesses several extensive lumbering plants, and because of its healthful surroundings has been selected as the location of two large sanitaria for consumptives.

To those who desire to visit the Muskoka region, only Gravenhurst will be the objective point. Boats leave Muskoka Wharf, one mile distant, for all points on the lakes, while passable roads encircle the entire section, even affording opportunity to cross some of the narrow portions and explore one or two of the larger islands.



It is presumed, however, that the tourist will prefer to skirt the eastern shore of Lake Muskoka for a time, branching off at Bracebridge for Falkenburg, Utterson and Huntsville, the latter the gateway to the Lake of Bays district. Here, again, the motorist has the alternative of taking a boat for the trip through the bays, or he may continue the journey by automobile, over somewhat troublesome roads to Deerhurst, Port Cunnington, Grunwald, Point Pleasant, Dorset, Port Sydney and a dozen other well known resorts.

The Lake of Bays is only one, although the largest, of several lakes, some of them linked by locked rivers, and others by open, free flowing streams. The shores are lined with curious dappled rocks and quaint little nooks, where ferns and foliage bend low as if to catch the whispering of the soft, cool waters that lap the land. Dark pines and cedars seem to grow out of the very rocks. At Norway Point is a charming sandy bathing beach, where the water is shallow for some 500 feet from the shore. Excellent fishing and hunting are among the diversions promised during their

Lake Cecebe, an Expansion of the Magnewatan River, Offers an Attractive Rendezvous for the Tourist in the Parry Sound District.

"Five O'Clock in the Morning," on the Way to Lake Rosseau in Muskoka Region.

season. Some exceptionally large catches are reported.

Huntsville offers a variety of scenery. The calm pastoral of Vernon, the romantic and ragged mountainous grandeur of Hollow, vie with the picturesque beauty of the Lake of Bays in deterring the tourist from continuing his trip. Here, indeed, are the Highlands of Ontario, a continuation of the great Laurentian range, through another portion of which flows the Ottawa river on its way to Montreal.

After spending such time as is deemed best amid these delightful surroundings, the itinerary anticipates the resumption of the tour to Parry Sound. The way reverses the inward trip as far as Utterson, at which point it turns toward the west, past Skeleton lake and across the Skeleton river to Rosseau, on the shores of the Muskoka lake by that name.

Rosseau is 33 miles from Gravenhurst, and between these two points lie two of the big lakes, varying in width from a few hundred yards to open stretches of water six miles across. Near this town is Rosseau river, which empties into the lake over a pretty falls, amid the greenery. In the three lakes are between 400 and 500 islands of every shape and size, ranging from one in Lake Rosseau comprising over 1100 acres to those containing but one tree, or a rock rising sheer from the water's edge. The most numerous, however, are densely covered with pine, balsam, cedar, birch, maple, oak and other varieties of trees. Many are the private property of wealthy Americans and Canadians, who have erected handsome summer homes thereon. Continuing along the old stage line the tour passes Blackstone, Star and Crane lakes, beautiful sheets of water, although suffering somewhat in comparison with the larger bodies but recently left behind. The night stop is at Parry Sound with its sheltered harbor just off Georgian bay. If preferred the tourist may ship the car to Collingwood and cruise among the 30,000 islands of this bay on the homeward trip. It is impossible to describe this wonderful waterway in a satisfactory manner, as nature has been most liberal in adorning it with rich scenic effects. Islands of every shape and size present their variegated foliage and moss covered rocks for the delight of the tourist.

Another interesting sail from Parry Sound is toward the north and the mouth of the Magnewatan river. It would be possible, with some difficulty, to continue by automobile from Huntsville to Burk's Falls, and thence by steamship down the river to Bying Inlet and Parry Sound. This is practically new territory and is by no means advised as touring ground except for those who are seeking adventure. The scenery is unexcelled, however.

Resuming the itinerary as outlined, Port Cockburn at the head of Lake Joseph, the third of the Muskoka chain, is the first point of interest. This is 45 miles from Muskoka Wharf, by boat, and here once more the tourist has the option of shipping the car or continuing to explore the Old Port Carling road. Within a radius of five to 10 miles from Port Cockburn there is found some of the best bass fishing in the northern resorts. At Bala, the Moon river connects Lake Muskoka with Georgian bay. This stream offers ex-

Lake Joseph at Port Cockburn Presents Much Beautiful Island Scenery.

Digitized by Google

cellent maskinonge fishing, and many have been caught weighing from 27 to 33 pounds. Near by are Long, Clear, Echo, Nine-Mile and Black lakes, each of which assures capital sport for the angler.

The return to Muskoka Wharf and Gravenhurst is along the old Bala road. This time Gravenhurst is made the night stop, after which the tourist reverses the route to Atherley. If desired this reversed itinerary may be continued back into Toronto, instead of the route as outlined, through the Kawartha lake region.

If possible, time should be spared for a side trip to Sparrow lake, which is reached from Severn. In addition to its romantic beauty, it has the attraction of being easy of access. Opportunity also is afforded for a beautiful steamer ride down the upper Severn river to Honey harbor and Midland, from which point another boat may be taken for a short ride amid the islands of Georgian bay.

As has been stated already, the following mileages are estimated, but it is believed that they will be found accurate. It is anticipated that those who attempt this tour with a full realization that they will be roughing it, away from modern cities and towns, will appreciate making the night stops where at least a good meal can be obtained.

TWO WEEKS IN ENGLAND AND SCOTLAND.

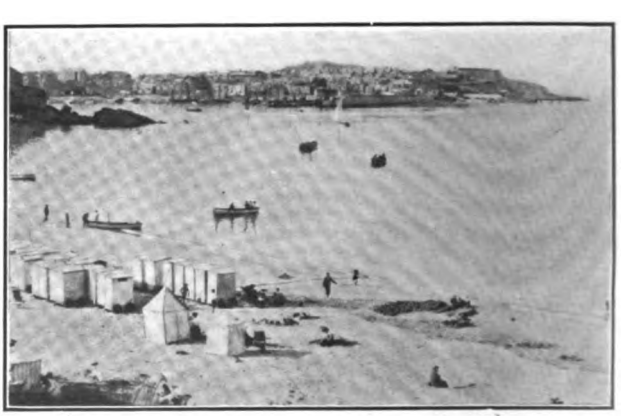
Natural Beauties of Great Britain Vie with the Historic in Attracting the Motorist---A Foreign Tour That Gives Ample Opportunity to Study British Life.

THOSE who have never toured abroad little realize the natural beauties of England and Scotland. Much has been written about the Alps, the Riviera, the Black Forest and other noted points on the Continent, but the British Isles most generally are considered as offering the greatest interest in things historic. To be sure, there are certain localities which have special attraction because of their association with men of letters; as for instance, Shakespeare's country, Canterbury and the land of Chaucer, and those sections made famous by Dickens, Burns, Scott and others. The fact remains, however, that nature has been quite as liberal in endowing England and Scotland with her choicest gifts, as any other portion of the globe.

One of the Beautiful Old Buildings in the University Town of Cambridge, England.

The tour outlined herein takes the motorist along the east coast of England through the lowlands of Scotland, to the very gateway of the highlands, and back to London through the English lake region. The outward trip visits the old university town of Cambridge and some of the summer beaches on the North Sea. Plenty of the historic and romantic is offered, as well, affording the tourist who has two weeks at his command, ample opportunity to enjoy thoroughly almost every phase of English and Scottish life.

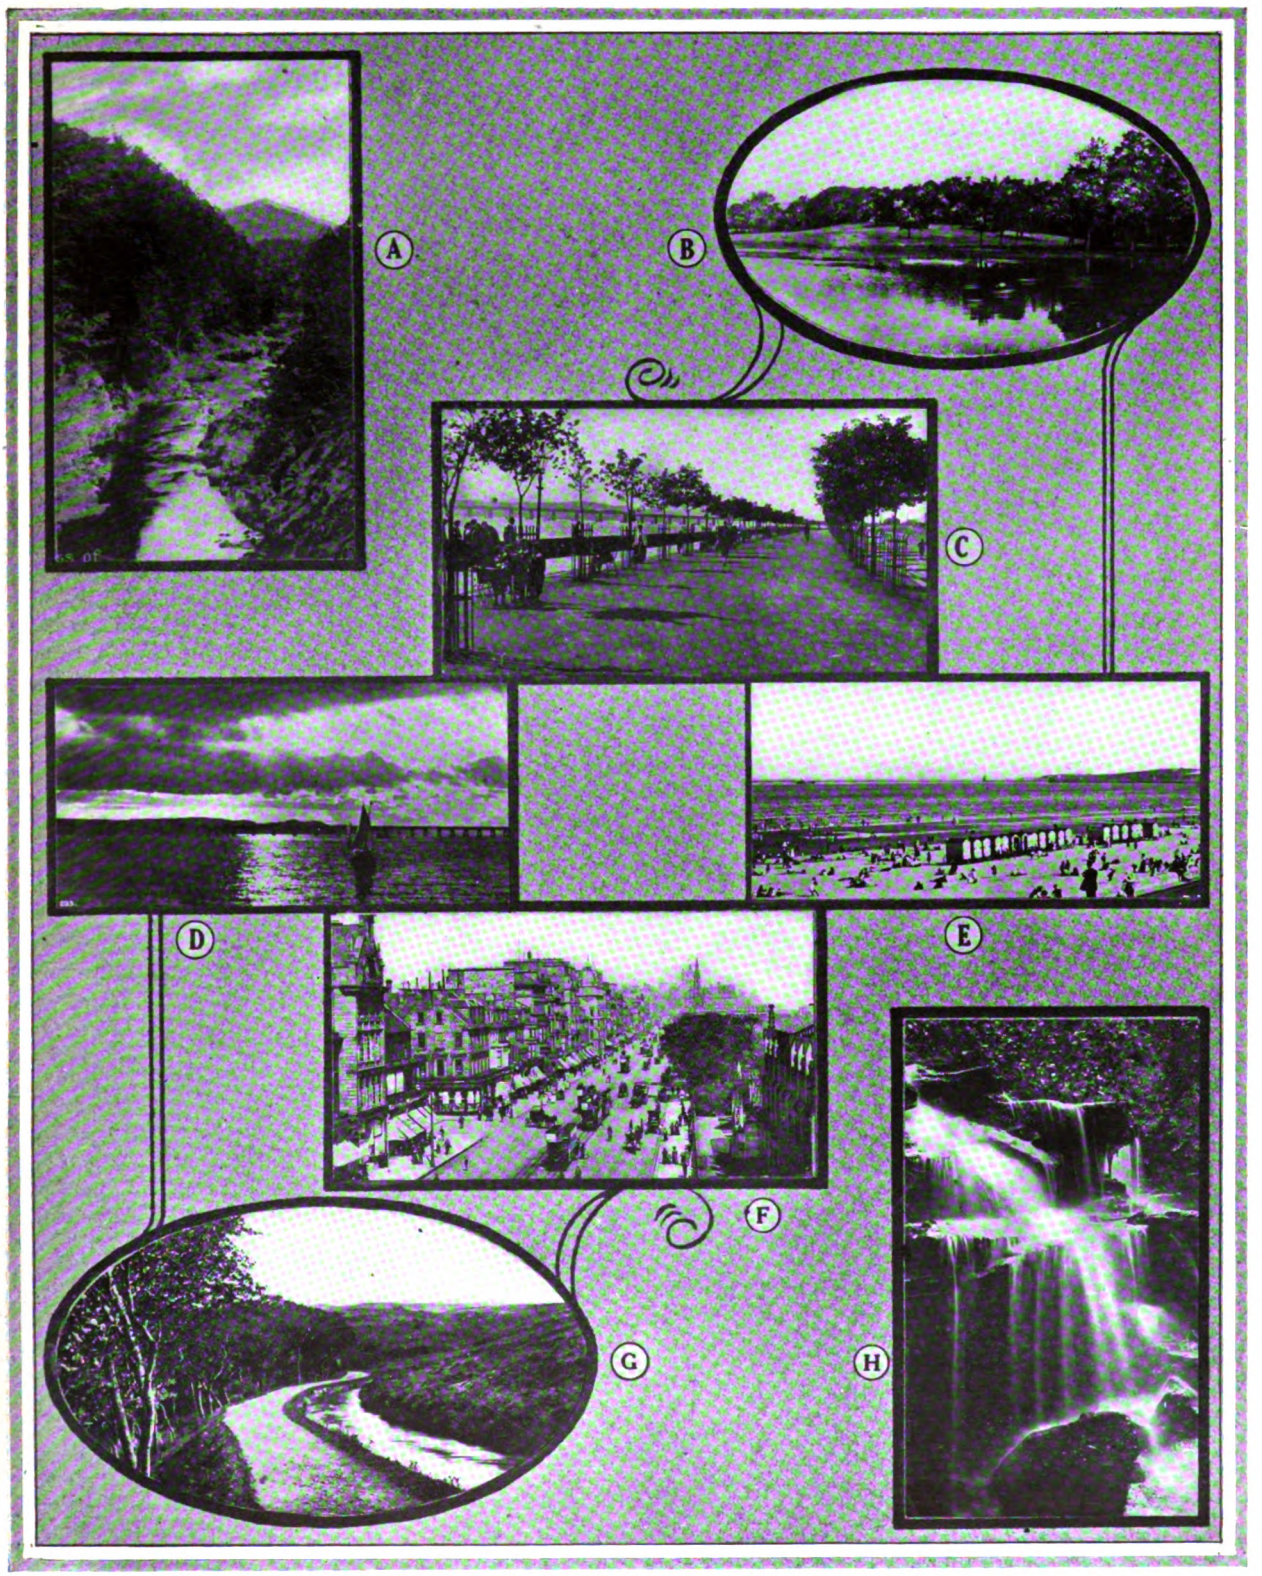
The information contained in this article is presented in connection with an article appearing elsewhere in this issue to which the reader is referred for details concerning the shipping of the car or hiring one abroad, and local regulations. It also should be mentioned that the Michelin Tire Company of 81 Fulham road, Chelsea, London, S. W., a branch of the Michelin Tire Company of Milltown, N. J., the well known tire maker, maintains a free touring office, to which every motorist is invited to apply for assistance in any manner. This company will prepare detailed itineraries for foreign tourists if requested. The itinerary is so arranged that the tourist may include as much or as little of it as desirable, continuing the trip by rail if preferred.



Leaving London the first day, Cambridge is the objective point, with Huntingdon as the night stop. The situation of Cambridge, bridging the River Cam, is not quite so picturesque as the sister university of Oxford, nevertheless, it is an attractive town, the stately old buildings being set off admirably by groups and avenues of magnificent trees which flourish nowhere to better advantage than in English scenery. The oldest college is Peterhouse, established in 1284. The most ancient building in the city is St. Benedict church, the tower of which is Saxon.

The way to Fenstanton is through marshland, where the great fortress of the Fens formerly stood on the Isle of Ely, entirely surrounded by water. It is memorable as having been the last stronghold of the Saxons, who maintained themselves here against the Norman conquest from 1066 to 1071. St. Ives is a very old town, and contains Slebe hall, once the residence of Oliver Cromwell, who was born at Huntingdon, of Saxon origin. It possesses much of historic interest.

Peterborough, reached early the second day, was founded as Medeshamstade by a thane of Mercia in 656. About this ancient abbey, has grown up the present town; the ruins of the monastic buildings, especially of the cathedral, are magnificent. The great feature of the latter is the west front, which was completed in the 13th century, and has three great open arches, making what probably is the finest church portico in Europe.



A short distance south of Stamford is the well known Burghley house, now the seat of the Marquis of Exeter, which is said to have furnished the text for Lord Bacon's "Essay on Building." The earliest English newspaper, the Stamford Mercury, was published here.

At Grantham is the quaint old Angel Inn, formerly owned by the Knights Templar, and so old that King John is said to have held court there in 1213. It was here that Richard III signed the death warrant of the Duke of Buckingham. Extensive iron works

now employ the people of Peterborough, but its chief memory is that of Sir Isaac Newton, who was born in 1642 at Woolsthorpe, seven miles distant.

There are few finer examples of Norman buildings

The Bridge Over Regatta Course at Henley-on-Thames, England.

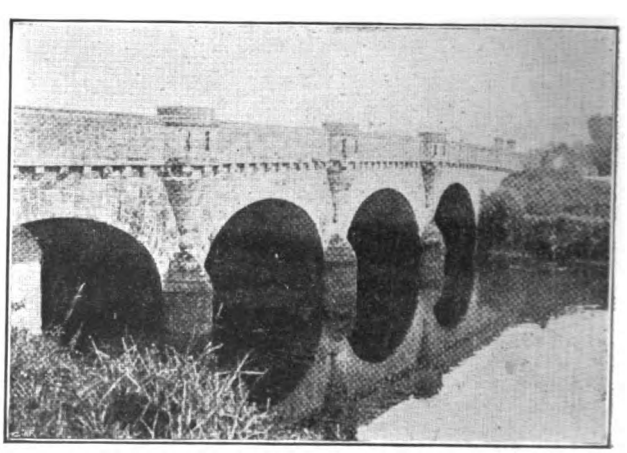
in England than the Minster at Southwell, which was raised to the rank of cathedral in 1884. The ruin of the archepiscopal palace, erected 600 years ago, is now the portion of a dwelling house.

The tour next enters the Sherwood forest, once the scene of Robin Hood's exploits. His abiding place is divided into numerous handsome estates, known as Dukeries. Chief among these may be mentioned Thoresby hall and Welbeck abbey, although these are not passed on the way to Mansfield, the night stop. A preferable method of visiting these mansions is held to be by carriage, employing a local guide at Mansfield.

Leaving the valley of the Trent and Sherwood forest, the way leads into Sheffield, on the Humber, of particular interest to Americans, because of the specially high grade cutlery steel produced there. Horace Walpole wrote of Sheffield: "It is one of the foulest towns of England in the most charming situation." Much of this smoke and dirt is due to the steel manufacture.

From the high hills in the neighborhood of Fountains Dale there is a magnificent view of the plain of York. The city itself is a venerable settlement, originally the Caer Evrauc of the Britons, and later called Eboracum by the Romans. It is now the capital of a county, exceeding in extent many kingdoms and principalities in Europe. Existing long before the Christian era, York was one of the first towns captured by the Romans during the first century. Portions of the old Roman wall still remain, among them being the Multangular tower. Not far away are the delapidated ruins of St. Mary's abbey, once one of the wealthiest and proudest religious houses in the north of England.

At Darlington, in 1825, the first passenger line in England was opened, and the first locomotive used on the line is preserved on the platform at Bank Top station. Durham is in the centre of the coal and iron region, with mines and furnaces in abundance. The cathedral was founded in 1093, to guard the relics of St. Cuthbert, who was famous for the severity of his mortification and his abhorrence of women. At his shrine, it is said, none of the gentler sex might worship; they were admitted to the church, but not even a queen could lodge in the priory. It is recorded that Queen Philippa once was admitted there as a guest, but was forced to flee half dressed to the castle.



St. Cuthbert's grave was at Chester-le-Street, the site of the Roman city of Condercum, but which was destroyed by the Danish invasion. In the old Church of St. Mary and St. Cuthbert, is the rude effigy of the saint which once surrounded his tomb, as is also the "Aisle of Tombs," a chain of 14 monumental effigies of the Lumleys, dating from Elizabeth's reign.

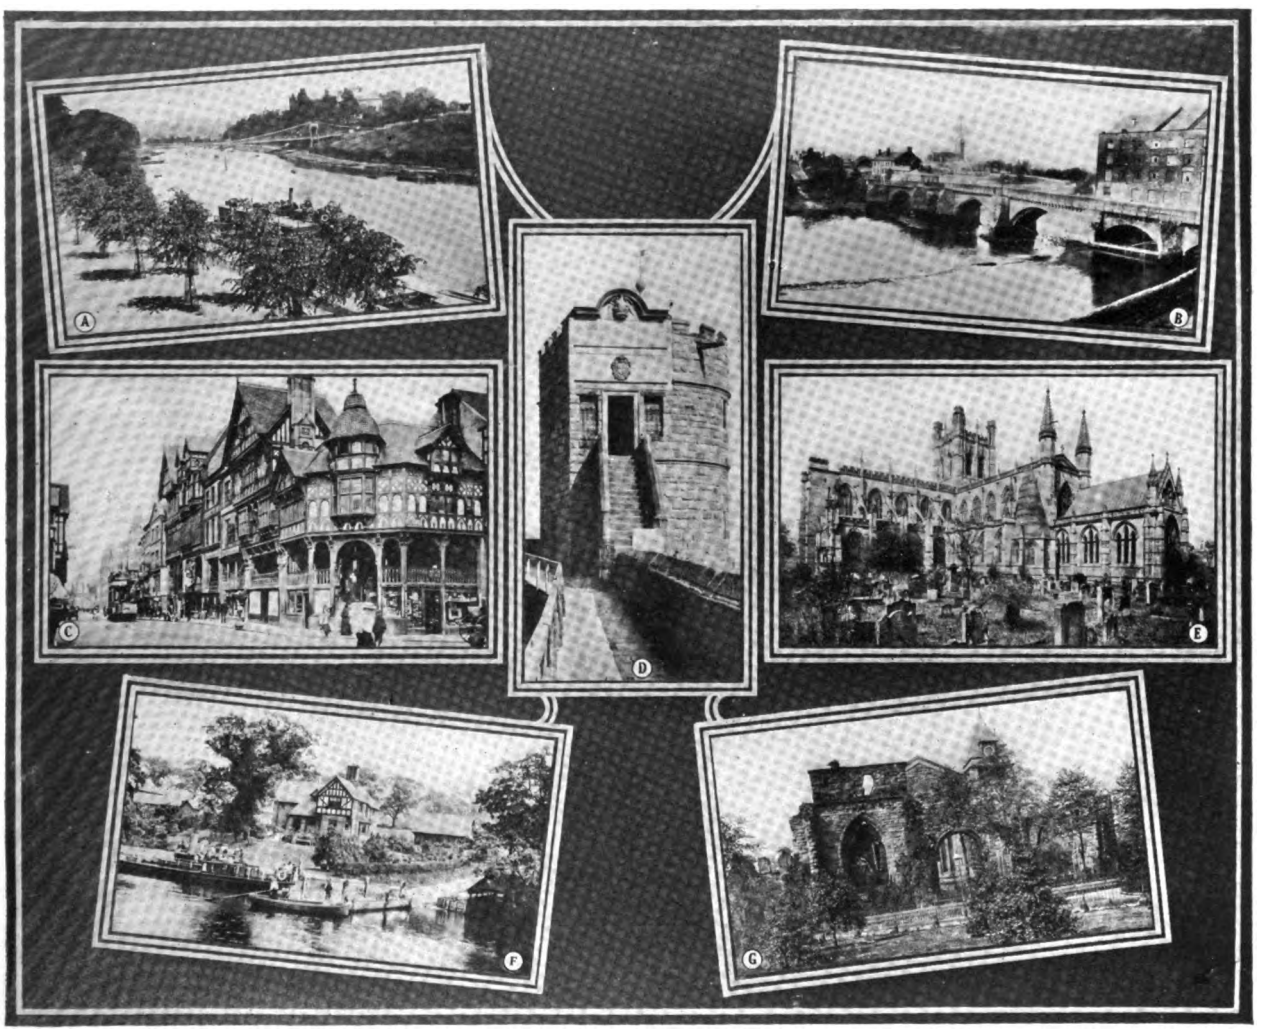
After the Norman conquest, Robert Curthouse, eldest son of William the Conqueror, came to the junction of the Wear and Tyne rivers, building the "New Castle," from which the name Newcastle-on-Tyne is derived. Nothing is left of this structure, the present ruin being that of the keep, dating from 1172. This has walls 12 to 18 feet thick, and rises 85 feet above the rock, the turret being over 100 feet high.

The ancient Belsay castle is located in a park near Belsay. This has a large peel tower, said to be the finest in the country. Otterburn is near the battlefield of Chevy Chase, 1388. Jedburgh is a picturesque border town, with a stormy history. The abbey was founded by David I in 1118, and presents one of the finest ruins in Scotland. Two miles further along is Ferniherst castle, dating from the 16th century.

The road now enters the moorlands. At Melrose may be seen the splendid ruins of Melrose abbey, founded in the 12th century by David I, destroyed by Edward II, rebuilt by Bruce in the 14th century, destroyed again and rebuilt 100 years later. Abbotsford, two miles away, and within easy driving distance, possesses the picturesque home of Sir Walter Scott, who in 1811 bought a small farm house, now the site of the fine mansion home of Abbotsford. Southeast of Melrose are the ruins of Dryburgh abbey, where Scott is buried.

Edinburgh consists of Old Town, made famous by Scott's novels, and New Town, which contains some very fine massive buildings. Old Town once was the

Fine Example of Stone Bridge Construction on the Way to Edinburgh, Scotland.



fashionable quarter, but it was destroyed by fire in the 16th century, and since rebuilding has been given over to the poorer class. Princes street is considered the finest in Europe. In Princes Street Park is a splen-

Digitized by Google

did monument to Scott. Space forbids a full description of the numerous notable places and interesting spots in and about the city.

It is possible to visit the highlands by motor car from Edinburgh, although it is considered far more practical to take the route as outlined across the lowlands to Glasgow, and from thence to Helensburgh, where steamships take the tourist to Loch Lomond and Loch Katrine, made famous by Scott's "Lady of the Lake." It is possible to visit this country by boat in university, founded in 1451, is of particular interest because of its fine 17th century gateway.

Near Bothwell are the ruins of Bothwell castle, home of the Earl of Bothwell, husband of Mary, Queen of Scots. At Hamilton is the magnificent seat of the Earl of Hamilton, and the ruins of Cadzow castle, with grand oaks and a herd of wild white cattle. Then follows the country made famous by the exploits of Wallace during the 13th century. The falls of the Clyde near Lanark are well worth seeing.

Interesting Scenes in the Vicinity of Chester, England: A, View from the City Wall; B, Dee Bridge; C, Eastgate Street, a Typical English Thoroughfare; D, King Charles' Tower; E, Chester Cathedral; F, Eccleston Ferry; G, Ruins of St. John's Priory.

one day, but a much better plan is to utilize two at least. As outlined, this itinerary anticipates it will take the tourist six days to reach Helensburgh, and five to return to London, so that ample time is allowed for two days spent among the lakes and mountains, and still complete the tour within two weeks.

Glasgow is the principal commercial city of Scotland. The harbor and docks are very extensive, having cost over $35,000,000. The cathedral dates from the 12th century, and High street, leading thereto, was the chief thoroughfare of the old city of St. Mungo. The

Scotland is left behind wtih Gretna Green, and the first town in England is Carlisle, once a border stronghold. In the cathedral here Walter Scott was married in 1797. The ruins of Scaleby castle present the result of the terrific battering received when it resisted Cromwell's forces. Sufficient of historic interest may be found here to hold the tourist for days.

The route next lies through the English lake district, starting at Bassenthwaite and ending at the foot of Windermere. Bassenfell is at the head of the former, while Keswick is on Derwentwater, considered the

Digitized by Google

most beautiful of all. Greta hall, the home of Southey and Coleridge, stands at the foot of Skiddaw, the bare craigs of whose summit are elevated over 3000 feet. Behind this mountain are the hills and moors of Skiddaw forest, with Scruffel hill beyond. Derwentwater may be encircled over a very pretty road, by adding 10 miles to the day's run.

Grasmere is beautifully situated at the head of the lake by that name. Wordsworth lived at Dove cottage here from 1799 to 1808, and lies buried in the churchyard. Grand views of the surrounding hills are to be obtained from this point. At Ambleside, time should be taken to visit the Church of St. Mary, which has a stained glass window in memory of Wordsworth.

Windermere is the largest English lake, having 14 small islands, which add much to its beauty. At Kendal may be seen the ruins of Kendal castle, a relic of Norman days and long since crumbled into decay. Opposite are the ruins of Castle How, and not far away the quaint appendage known as Castle Dairy, replete with heraldic carvings.

Lancaster occupies the site of a Roman camp in the first century. It stands on the slope of an eminence rising from the Lune river, and the castle towers crown the summit, the fortress being spacious, with a large courtyard. The keep is square, enormously strong, and defended by two semi-octagonal towers. This is called "John of Gaunt's Chair," and commands a fine view of the surrounding country and far away across the sea to the distant outlines of the Isle of Man. The Duchy of Lancaster is still attached to the crown. If desired, a side trip to the Isle of Man may be included in the itinerary.

The next day's route lies through the cotton manufacturing centre of Great Britain to Liverpool. Preston is a very old town, formerly the scene of many wars between the English and Scotch. Ormekirk contains an old church with high embattled towers. Liverpool is the second city of importance and the principal seaport in England. Some very fine buildings surround St. George's hall, which is in itself a splendid piece of architecture. If desired, arrangements may be made for returning to America from this point, dismissing the remainder of the tour.

Chester is the most quaint town in all England, care having been taken, even in making modern improvements to retain the old features of the place. Then follows a little of Wales, through Wrexham and Ellesmere to Shrewsbury, the scene of the War of the Roses. The town is on a fine peninsula, almost encircled by the Severn, and the castle stands facing the mainland. Only the square keep and a portion of the inner walls remain. In the vicinity are the ruins of the Roman city of Uriconium, said to have been destroyed by the Saxons in the sixth century.

Bridgenorth is an ancient town planted on a steep hill, full of quaint houses and having a covered market where the people gather on Saturday. The most prized relic is the foundry and blacksmith shop standing by the river. It was in this building that Bishop Percy, author of Reliques, was born. On a promontory of sandstone, about 160 feet above the river, are the ruins of Bridgenorth castle, built 800 years ago.

Worcester, the night stop, still retains the plan of the original Roman camp. Before Roman times, it was known as the Caer Guorangon of the Britons. The most conspicuous building is the cathedral, dedicated to "Christ and the Blessed Virgin Mary." Its western front overlooks the Severn, and the ground plan is an elongated double cross with short transepts.

Tewkesbury is at the confluence of the Avon and Severn. The ruins of the abbey, founded in 715, rise above the foliage and orchards, and the immediate vicinity is noted for its rich meadows. Gloucester was considered a point of great military importance by the Romans. It is located at the foot of the Cotswold hills, with the hills of the Forest of Dean rising on the western horizon.

For 10 miles along the chalk ridge about Wantage may be traced an old grass grown Roman road, and from this breezy height the tourist has a grand outlook over the Vale. Down in the valley is Faringdon, the place of residence for the Saxon kings. Alfred the Great was born at Wantage in 849. The return to London is by way of Wallingford, Henley-on-Thames and Maidenhead.

Obviously, in the limited space available in an article of this nature it is not possible to set forth all the attractions which would occupy the attention of the tourist for two weeks on a journey covering so large a portion of the country. The best that can be done is to offer a hint here and there as to what may be seen, but the American who decides to take this tour will find his time well spent throughout its entire length.

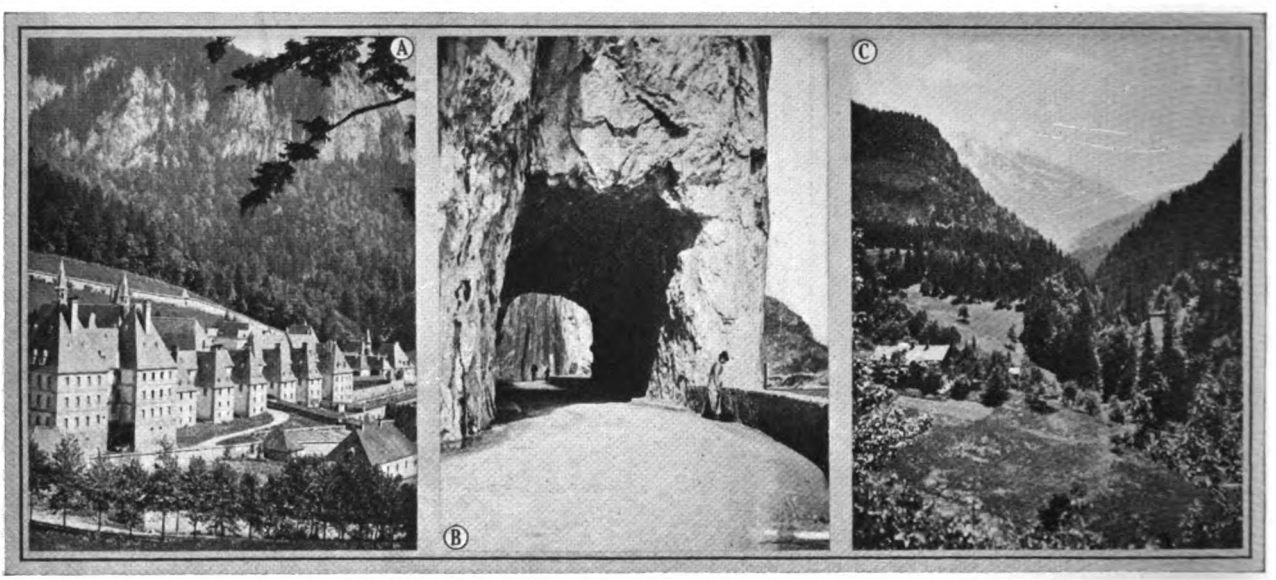
MOTORING IN THE ALPS AND PYRENEES.

Splendid French Roads Give the Automobilist Abundant Opportunity to Enjoy Europe's Wonderful Mountain Scenery Under Ideal Conditions.

MOUNTAINOUS Europe long has held a peculiar charm for the American. Those who have not beheld the Alps have never really toured abroad. Not only have these peaks played a prominent part in the history of the world, but their majestic grandeur possesses a distinctive beauty all its own. Many portions are not easily accessible for the automobile, but that section known as the French Alps has been supplied with some very excellent ways, over which there is little difficulty in driving during a greater portion of the year.

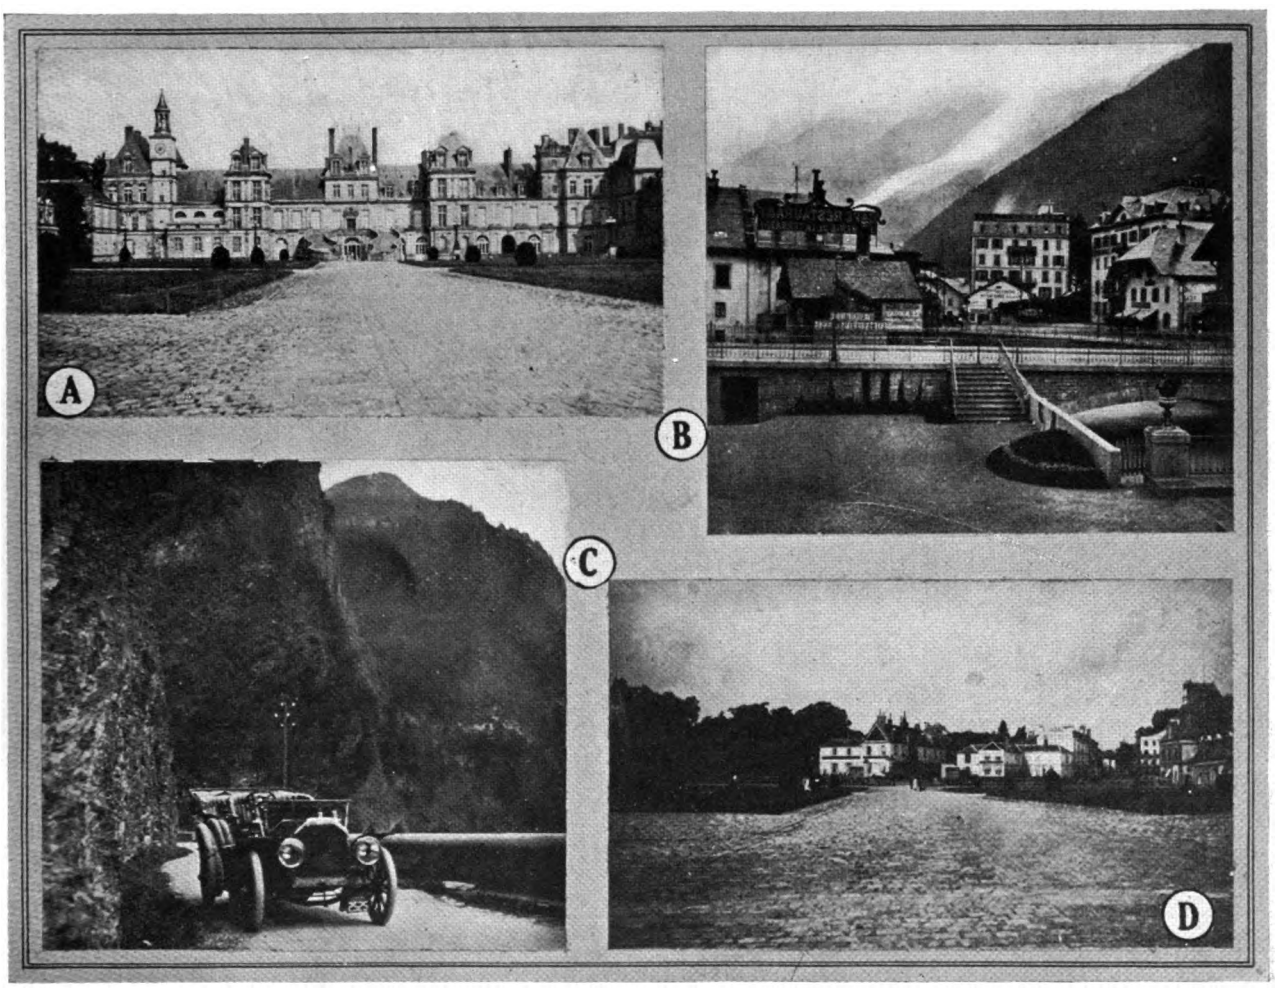


The Swiss cantons may have deemed it inadvisable to court the favor of motorists, but France looks at this matter in a very different light. As a result large sums have been expended in laying out and maintaining roads that make it comparatively easy to visit some of the most interesting points within this district. And yet, conditions are such as to add a particular zest to the journey. No American car will find it impossible to reach the heights, as indicated in some of the photographs accompanying this article.

The same may be held to apply with equal force to the Pyrenees, on the border line between France and Spain. While the roads may not be in quite the good condition of those in the Alps, the mountains are not as high and the effort is not so great for the car. The views are somewhat less grand and awe inspiring, but still possess sufficient of interest for the tourist.

The accompanying itinerary includes both. Portions of it may be used in combination with other trips on the continent. For example, it would be possible to make Geneva the headquarters from which to continue the journey through Switzerland to Germany, and thence back to the seaboard in the latter country, Holland or Belgium. From Digny or Aix it would be possible to take a run along the Riviera into Italy. At Perpignan or Lourdes, one might venture across the border into Spain and Portugal. In the latter instance, it perhaps would be better to reverse the tour from Paris.

As has been brought out elsewhere herein, the Michelin-Guide, 88 Boulevarde Pereire, Paris, will be glad to supply all necessary information for carrying out these possibilities. In addition the Michelin Tire Company, the American branch of which is located at Milltown, N. J., publishes exceedingly valuable guides, not only to France and Great Britain, but to Germany, Spain and Portugal, and the sunny countries, the latter including Algeria, Tunis, Egypt and Italy. The American contemplating a tour abroad is advised to communicate with this concern.



As is true of the British tour outlined previously, this itinerary is by no means confined to the tourist who owns a car. Ample opportunity is afforded those who desire to engage a chauffeur and machine abroad and thus enjoy this modern method of visiting the mountains of Europe. While these arrangements may be made after arrival in France, it is much more satisfactory to complete the details before leaving home. This may be done through a number of American agents, among whom may be mentioned the Raymond & Whitcomb Company, 225 Fifth avenue, New York City. Under this plan all delays are avoided.

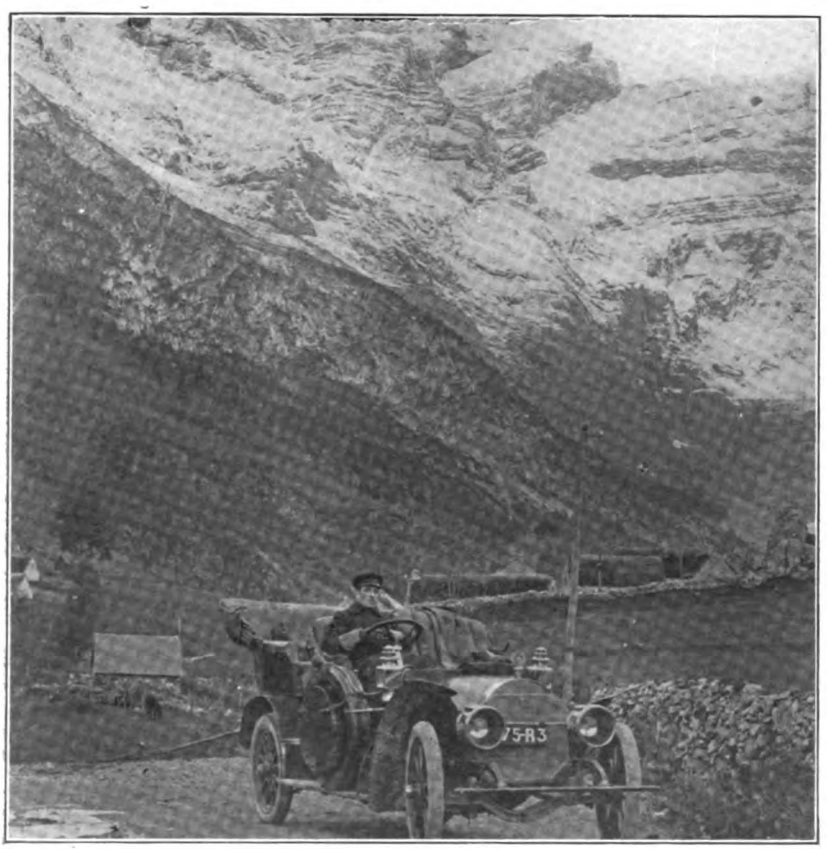
Leaving Paris the first day, the tour enters the forest of Fountainebleau at Melun, stop having been made there, it is presumed, to inspect the church of Notre Dame, built in the 11th century, and that of St. Aspa, constructed 300 years later. This handsome forest is one of the largest and finest in France, and the tourist easily may fancy Napoleon riding over to his place at Fountainebleau from the capital. This structure is well known to students of history, and is surrounded by magnificent gardens. The public is admitted freely to the latter, but there are some portions of the palace to which they are not welcome. The decorations of that part which is open to visitors

Scenes on the Outward Journey: A, Palace of Napoleon at Fontainebleau; B, Mt. Blanc, Monarch of the Alps, Seen from Hotel at Chamonix; C, Splendid Road Leading from Geneva to Chamonix; D, Gateway to the Gardens at Fontainebleau.

are superb. A visit to Fountainebleau should serve to renew the American's interest in French history with a better knowledge of Napoleon.

Sens is one of the oldest and most interesting of the cities developed from sites antedating the Roman period. It was formerly Argendincum and the capital of Senones, who took part in the invasion of Italy and the capture of Rome, B. C. 396. The Cathedral of St. Etienne was built on the site of a pagan temple, and was begun in 1124, although it has been restored and remodelled several times since that date.

Tonnerre, the night stop, also is of Roman origin. There are several noted buildings, one of which is the hospital, containing the tomb of Marguerite de Bourgogne, Queen of Sicily. It dates from the 13th century, and besides the library and musee, comprises a chapel with a remarkable roof of wood. The church of St. Pierre is another structure that should be seen.



At Ancy-le-Franc is a pretty chateau, the decorations of which are by celebrated masters of painting. At Dijon is a botanical garden, boasting a black poplar tree, said to be 500 years old, 130 feet in height and 40 around at a point three feet above the ground. The town was decidedly prominent during the religious wars, and is noted for its many specimens of early architecture. Auxonne contains an interesting cathedral while Dole, capital of the former dukedom of Burgundy, is ripe with historic lore.

The night stop is Poligny, from which point it is an easy day's drive to Geneva, over one of the routes nationale. These French highways in the Alps region are constructed of white flint. When damp this has the appearance of marble, but when dry there is.

Digitized by Google

a fine dust, not unlike flour. There is a certain elasticity about the road between Poligny and Geneva, which tempts the motorist to get the utmost speed from his car. This tour crosses Switzerland in the so-called free district, and it is only necessary to present the triptyque to comply with the customs formalities.

It undoubtedly would be possible to make the entire distance into Chamonix in one day, but it is anticipated that the tourist will desire to spend some time in Geneva, the most interesting of all the Swiss cities and undoubtedly the best known. As already indicated herein, it is possible to make this the starting point for a tour throughout Switzerland and Germany, or it may be made the headquarters from which to visit all sections of the Alps and southern Europe.

The Valley of Gavarnie in the Pyrenees, Between France and Spain.

The road from Geneva to Chamonix is that most frequented by motorists. It is one of the most delightful rides that can be enjoyed from the standpoint of scenic beauty. The way leads through Haute Savoie, over excellent surface, between precipitous cliffs and mountains that rise thousands of feet into the air. In many places tunnel-like cuttings have been made, where spurs of rock jut from the mountain side into space. Frequent glimpses of Mt. Blanc are to be had, long before Chamonix is reached, but it is at the latter town that the famous peak is seen best.

The tourist leaves Chamonix for the real experience with Alpine roads, At times they descend steep grades, while at others they run high above deep valleys, beside glaciers and through tunnels. Always, there are magnificent views of the mountains. On the way to Grenoble, just before reaching Domene, in the valley of Isere, the heights of Chartreuse and Belledonne are to be seen.

Between Grenoble and Gap there are many interesting lake and river prospects, to combine with the mountains. This is particularly true beyond Vizille, where the windings of the Romanche river are best noted. On the way to La Mure, the road passes three or four very picturesque lakes. Then follows two or three somewhat steep grades, until just before reaching Corps, the Drac river begins to narrow and the scenery is very beautiful. The road from Corps to Gap is through the Bayard pass.

Leaving Gap, the valley of the Laye is bordered on the right by wild, rocky slopes, as far as Chorges from which point the way leads into the valley of the Durance, past jagged rocks and marble quarries. Then comes the tunnel to Colliers. Beyond Seyne, it skirts Grand Guy and descends into the valley of the Bes, only to reascend into a beautiful forest above a deep ravine. The valley of the Arigeol presents some interesting grassy plains and numerous wild gorges with precipitous rocks. After leaving La Javie, there is a dangerous turning, before entering the Bleone valley.

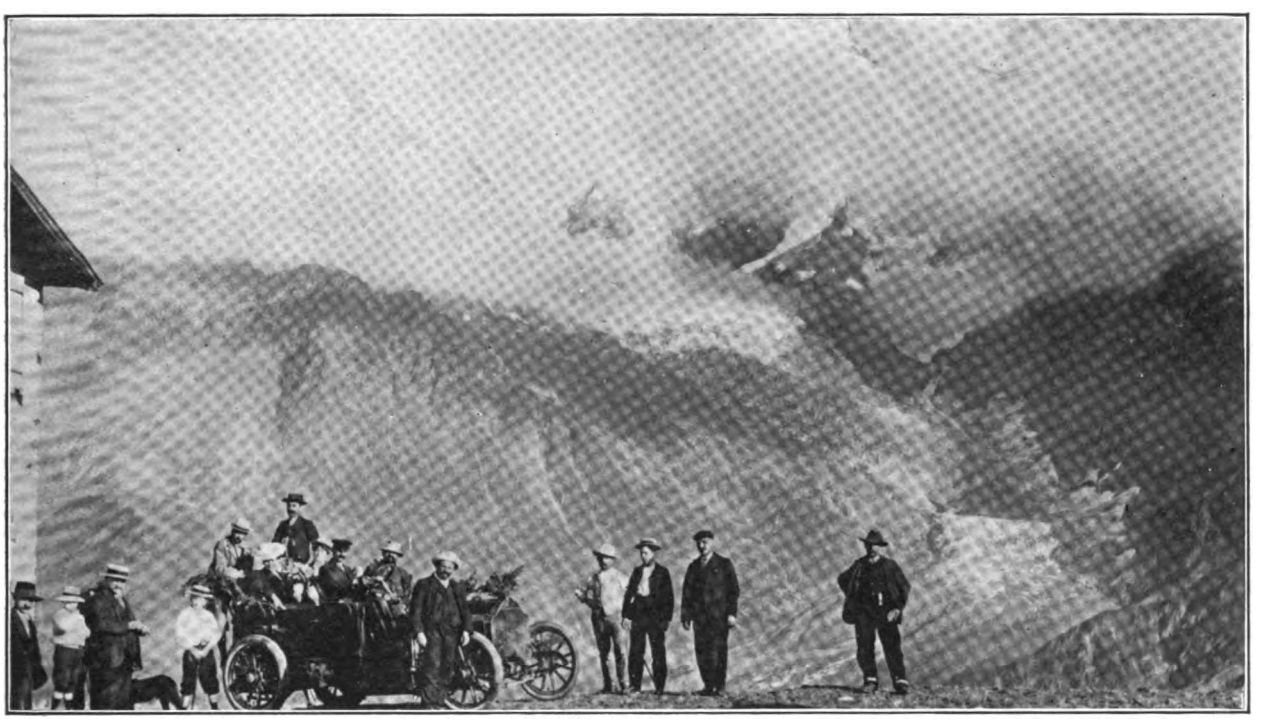
The route from Digne to Aix is a succession of descents, with many crossings of bridges and plenty of interesting scenery. Two days are given over to crossing southern France, much of the time in full sight of the Gulf of the Lion. It must not be supposed that these cities and towns do not offer much that is interesting and worthy of a visit. The comparatively level country and better road surfaces will present a welcome relief for the driver, while the change in scenery will be appreciated by the other members of the party.

From Perpignan, the road leads up into the Pyrenees. At first the mountains are small, and appear somewhat insignificant in comparison to those left behind. At Quillan, there begins an ascent by wide curves into Puivert, and shortly afterward a descent into the valley of the Hers, from which point excellent views of the peaks are obtained. Another down grade into a forest brings the tourist to Lavelanet. Foix is at the end of a wild valley and amid interesting scenery.

The ledge road above the Argel leads through the valley, alternately green and rugged to St. Girons. It next enters a narrow defile to St. Lizier, and thence to Montsaunes through the valley of the Salat, bordered on either side by wooded hills. The night stop is St. Gaudens, from which city many excellent views of the surrounding country are to be obtained.

The next day's route takes the traveller even

Digitized by Google



nearer to Spain before turning northward at Lourdes. Snow capped peaks are to be seen on either side through Montrejeau and Capvern to Bagneres de Bigorre, after which the remainder of the ride into the night stop through the smiling and cultivated valley of the Adour offers a decided contrast.

This fertile plain continues on the way to Tarbes, and after that comes the valley of the yellow Gers to Auch, and the broad Garonne to Agen, the centre of the bottled plum industry. Numerous odd little ranges are encountered on the way to Villeneuve-sur-Lot, and here and there are to be noted picturesque rocky glens. Villeneuve is a very old, crowded, fortified town, with an arcaded square that might have been transplanted bodily from southern Spain.

Bergerac is on the big Dordogne, and presents a somewhat curious mixture. A brand new church, particularly ugly streets, a heavy and more or less modern bridge, a wide rushing river and some of the oldest, quaintest and most picturesque houses are to be seen. Tourists visit Perigueux, the night stop, for a glimpse of the most perfect Byzantine cathedral in all western Europe. It is also at this place that the famous Perigord pies are made.

The last two days are spent among the chateaux of the Loire. At Chalus is to be seen the remnants of the great fortress, in attacking which Richard Coeur de Lion received his fatal wound. Between this point and Limoges is the western extremity of the Auvergne mountains, the best known peaks of which are the Puy de Dome and the Cantal, both of which ought to be visible from the road.

The night stop is at Chateauroux. The principal point of interest on the last day's ride is Orleans, the home of Jean d'Arc, who delivered the city from the siege of the English in 1428. The house occupied by her is one of the show places. Others include the handsome cathedral of St. Croix, and the old town hall, built in the 16th century. Tourists will find the roads of the best throughout the day's run.

Climbing Mt. Prarion in Switzerland, Near Mt. Blanc, Indicating That an Automobile Is Able to Scale the Heights.

ITINERARY.

Paris — Tonnerre — Poligny — Geneva — Chamonix — Grenoble — Gap — Digne — Aix — Montpelier — Perpignan — Foix — St. Gaudens — Lourdes — Agen — Perigueux — Chateauroux — Paris.

Seventeen Days, 1513.1 Miles.

ONTARIO TOURING REGULATIONS.

Because of not being properly informed concerning the laws, many American motorists who visit Canada each year are put to much inconvenience and annoyance soon after crossing the border. In order to foster international touring of this nature the Province of Ontario has prepared a brief summary of the principal regulations as follows:

1—The driver must be at least 18 years of age, and in no way intoxicated.

2—Any person operating an automobile for gain or hire must be licensed to do so, and no person may employ another for that purpose unless so licensed.

3—No automobile is allowed on the public highway unless provided with a provincial license and number, which cost $4 for a calendar year.

4—At all Canadian ports of entry will be found a custom house broker who provides foreign tourists with automobile licenses. Ordinarily this broker is the representative of a bonding company, and will bond cars against interference by the customs for six months, for which the deposit is $10. The tourist is given a copy of this bond, and upon finally returning out of the country, he should have the customs at outgoing port certify that fact upon the copy. This copy should then be sent to the issuing broker, who sends the release of bond obligation and $5, keeping the other $5 for his services.

5—The automobile must be provided with a gong or horn and suitable lamps.

6—No other number than that of the provincial license may be exposed, and must be kept clear and plainly visible. No searchlights are permitted.

7—The maximum speed within city limits is 15 miles an hour; in country, 20 miles. But drivers are enjoined to slow down whenever the exigencies require it. Upon passing a team, slow down to seven miles an hour, and when going in same direction sound the gong and give driver an opportunity to turn aside. Upon meeting a funeral, turn aside as much as possible and stop until it passes.

8—If an accident occurs to any person on foot, horseback, or in a vehicle, owing to the presence of the automobile, the person in charge thereof must go back to the scene of the accident and give in writing to the person sustaining loss or injury the name and address of the owner of the motor vehicle and number of license.

9—In case of injury or damage the onus of proof that the same did not arise through the negligence of the driver of the automobile rests upon the owner or driver thereof.

10—Violations of any of these regulations are punishable by fine or imprisonment, or both. Any police officer may in good faith make arrests without a warrant; and "every person may arrest without a warrant any person whom he finds committing any such offense" above referred to.

FROM OCEAN TO OCEAN.

W. H. McKinnon of Oakland, Cal., one of the most enthusiastic motorists on the Pacific Coast, is about to start with his wife and two sons, William and George, on one of the most unique ocean-to-ocean tours ever attempted. Mr. McKinnon plans to dip his tires in the Pacific ocean at Los Angeles, Cal., travel down the west coast of Mexico to Panama, across the isthmus along the canal route, continue up the east coast of Central America and Mexico, through the states to New York City, and run his machine into the Atlantic ocean at Coney Island. Mr. McKinnon, who has large lumber and mining interests in California, has been accustomed to keeping several cars at various points for his use, and it is in one of these, a big Matheson, built by the Matheson Automobile Company with headquarters at 1886-88 Broadway, New York City, that he proposes to make the unusual run.

SHIPPING THE CAR ABROAD FOR FOREIGN TOUR.

VERY few Americans realize the ease with which foreign tours may be made taking one's own car across and making the rounds of the scenes of Insular and Continental beauties in the old, familiar machine. While "Seeing America First" is strongly advised, there is no gainsaying the increased historical and scenic influence of many European countries. Considering that such touring is strongly on the increase, it will be the purpose herein to make the shipping of the car as easy and simple for the prospective tourist as is possible.

Such a task naturally divides itself into four or five parts, each one of which differs from the others, but all of which are needful. These are: The time when the tour will be made, that is the season of year, month, etc.; how to go, including the line on which to cross the ocean, the date of sailing planned to coincide nicely with the previous decision, the class, fare, berth and other reservations; the formalities

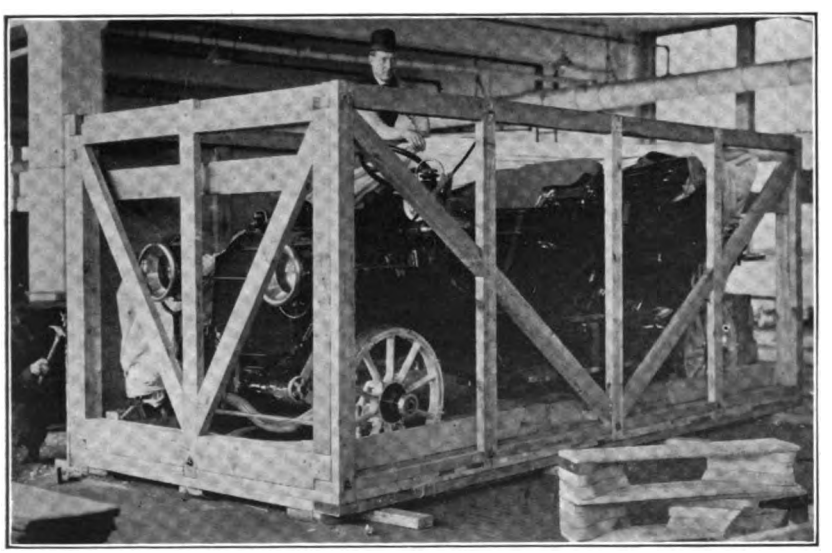

Fig. 1—The Initial Step in the Crating for Foreign Shipment, Constructing Framework About the Car.

needed to procure safe and speedy personal entrance and exit into the various countries to be visited, this being the customs end; the arrangements for the use of the car, including driving licenses, payment of foreign country fees, proof of ownership of the car, ability and right to drive in native country, etc.; actual preparation of the car, previous to shipment, overhauling, adjusting, etc., crating or boxing it, preparations after unshipping on the other side, and other items.

Considering the first, it must be settled first of all what the trip and tour are for. If to see mountain views, glaciers, enjoy good roads and the like, any time will do for southern Europe, while October to March, inclusive, are the best months. June to September, inclusive, are too hot for comfort. If Scotland, Ireland, Norway, Sweden, Finland and northern countries are to be visited, any month in the year can be utilized, the hot months being particularly advisable for the last three.

There are other reasons for selecting the time of year or month in which to go abroad; thus poor sailors always choose months in which the weather is normally good, or on the other hand, avoid the time of year when the water is known to be rough. In any case, it may be set down as an axiom that the tour should be planned many months in advance. For this purpose, it is well to secure and read a number of books of travel, foreign road guides, histories, Baedeker's and other works, so as to make the choice of country or countries to be toured through a long time ahead.

Second, it becomes necessary to make arrangements for personal passage, including fare across, berth and other items. In doing this, one must pick out the steamship line over which passage will be booked, the approximate week in which sailing is desirable, and thus, the ship. To assist travellers in this respect a table is presented herewith which gives all of the most important sailings for the touring season of 1912; that is, up to about Oct. 1. After that date, the times of departure and the boats are changed, so the companies should be consulted directly. This list is compiled from data furnished The Automobile Journal for this purpose by the Church Ticket Agency, 58 Exchange street, Providence, R. I. It should be remembered that all sailing dates are subject to change.

During the summer months, when the tide of travel is outward, it is often difficult and sometimes impossible to secure passage on the desired boat if less than a month be allowed for its purchase. This is one reason the planning must be done so far in advance. In the selection of the line to use, the destination will usually determine one or two between which a financial choice must be made. This latter cannot be commented upon except to say that the finances of each party will govern the line to be utilized. It might be added that of late years, the second cabin has been used more and more by those wishing to take a long trip on small means.

Seatings at the table, steamer chairs and other similar items are settled on the ship just before or after sailing with the ship's steward. In the matter of fares, the reader is referred to the Raymond & Whitcomb Company, New York City, or nearly any railroad office for information. In general, the variation is from $65 upward first class, and $47 upward for second, with the general average of the first at about $85 and the second at $60. This, of course, is for personal passage only and does not include the charges on the car, or anything beyond trunks and other personal baggage.

The third item of attention, taking them in order first laid down, although this is perhaps first in point of importance, is the matter of safe and speedy passage through the various customs and army departments. The first requisite includes passports for each

Digitized by Google

member of the party, or if the makeup of the group is definitely settled, a passport including all. This is issued by the State Department, Washington, D. C., and the charge is $1 each. A man, wife and children under 21 years of age may be included in one paper.

To go with this, there should be taken a picture of the car, the owner and the driver, in case the two latter differ, as when a chauffeur drives the machine. Of these, from six to 12 unmounted prints of each should be carried. In taking the pictures and trimming the prints, it is advisable to take only a head and shoulders of the individuals, as many of the foreign customs regulations limit the size of the picture to 1.5 to 3.5 inches for the car and .875 by 1.25 inches for persons.

In addition, the possession of the car should be capable of rapid proof. This may be managed by securing a letter from the manufacturer or his nearest agent, giving make, maker's name, style of body, color of chassis, color of body, number of cylinders, horsepower, bore and stroke, engine number, wheelbase, tread, body number, make of tires, weight in both

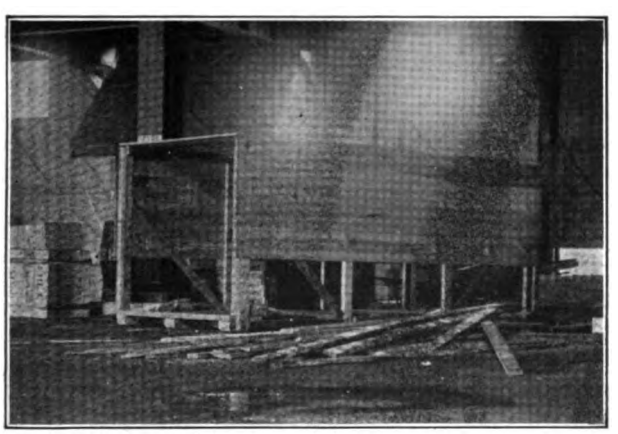

Fig. 2—Second Step in the Crating Process, Building Up the Side Posts and Putting on the First Boards.

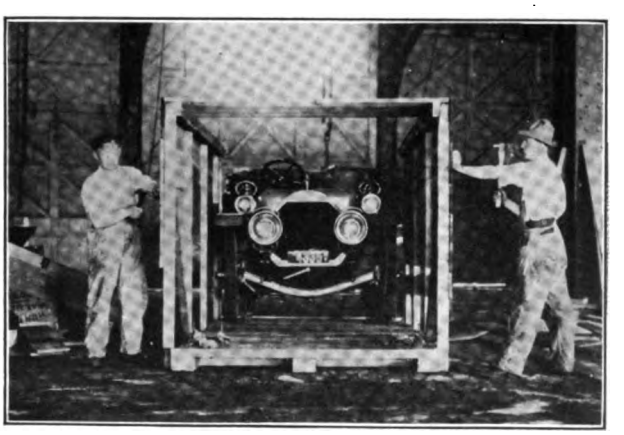

Fig. 3—Third Step in Housing the Vehicle, Putting on the Rest of the Boards After Pushing the Car In.

pounds and kilos, number of seats, equipment list, and value of the car. The latter is well certified to by carrying the dealer's receipt. All of this information in the manufacturer's letter will be in English, of course, but it is well to have a translation made into French and German, this being incorporated in copies of the letter.

Over and above this, the various customs formalities relative to leaving the home country and returning to it require that a full description of the car be given at the point of departure, and a customs receipt secured and preserved. An additional, similar description and customs declaration should be made to the United States consul at the port of return shipment. The latter declaration must include all equipment and similar description to the first declaration. In this connection, care should be taken not to purchase and add to the car a large number of foreign equipment items, as repairs made abroad or appurtenances added thereto to the amount of 10 per cent. of the value of the car, will cost the owner full duty on the entire car and equipment.

This is only in case the equipment is left on the car. It can be avoided by detaching from the vehicle, shipping separately, and paying duty individually upon all foreign-bought accessories. In the case of practically all foreign countries—except when the triptyque privilege is available—deposits covering the full amount of duty must be made. With a triptyque, the frontiers of nearly all European countries can be passed without duty deposits being made.

When a single country is visited, this deposit, varying with the country and size of the car must be made anyhow. It will be refunded on the return, providing all customs formalities have been complied with, otherwise there will be a deduction.

The triptyque papers are obtained by touring clubs for their members only, being in the nature of club passports, the club guaranteeing the payment of various fees and compliance with the different rules and regulations. This being the case club membership becomes a necessity, although American clubs are recognized to some extent. Thus American Automobile Association membership cards will be accepted by a number of foreign bodies as sufficient credentials to warrant election. Among these may be noted: Touring Club de France, 65 Avenue de la Grande Armee, Paris, France; Automobile Association, Fanum House, Coventry street, London, England; Motor Union of Great Britain and Ireland (now combined with one or two other bodies), 1 Albemarle street, Piccadilly, London, W.; Touring Club of Italy, 14 Via Monte Napolene, Milan, Italy; Touring Club of the Netherlands, and others.

The first named is the strongest, and by all means of the most use to the tourist, although if the British Isles are visited, one of the English clubs should be included also. Membership in the organizations costs as follows: A. A. A., $5; T. C. de F., six francs ($1.20); A. A. (England), £1 1s. ($5.25); Motor Union, the same; T. C. de I., 10 lire ($1.94), and Netherlands three gelder ($1.20).

As its name indicates the triptyque is in three parts or sheets, the first of which is attached by the customs official at the point of entry, the second by the customs on the final exit, and the third, duly signed and stamped by the customs officers for entry and exit, is retained by the tourist. A separate triptyque is issued and used for each country entered.

Digitized by Google

After the country has been crossed, the third sheet, signed and sealed, is returned by the tourist to the club, which then refunds the original deposit less a small fee which is retained for services rendered.

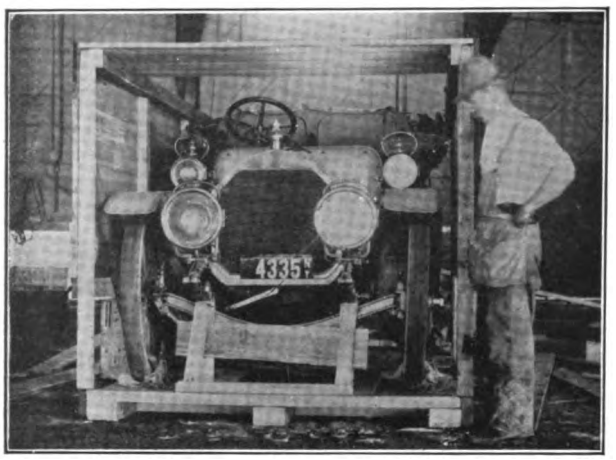

Fig. 4—Fourth Step, the Car in Place with Tires Off. Sometimes the Wheels Must Be Taken Off Also.

These papers are useful in the following countries, for the lengths of time indicated, and under the payment of the specified fees:

Country.	Available.	Deposits.

France—For one year, $6.90 a 100 pounds.
Germany—For one year, $1.70 a 100 pounds.
Holland—For one year, five per cent. of declared value.
Belgium—To Dec. 31 of year, 12 per cent. of declared value.
Italy—Three months from date, $120.
Switzerland—Six months from date, $3.55 a 100 pounds.
Spain—Four months from date, $250 to $400.
Austria—Two months from date, $11.14 a 100 pounds.
England, Scotland, Ireland and Wales—Unlimited; no import or export duties.

The advantages are: A single deposit in advance, a single prompt refund, no delays or worries, as in the securing of refunds in small frontier customs houses, and generally better satisfaction.

While this sounds formidable, much, if not all of it, can be avoided by placing the entire responsibilities with a reputable agent, as for instance, the Raymond & Whitcomb Company, previously mentioned, who will take the car description, photographs, and other materials, and attend to all formalities, including the shipment, the securing of triptyques, customs and

triptyque deposits, etc. It is thus possible to turn the entire case, so to speak, over to an agent, and land on the other side with the necessary papers in

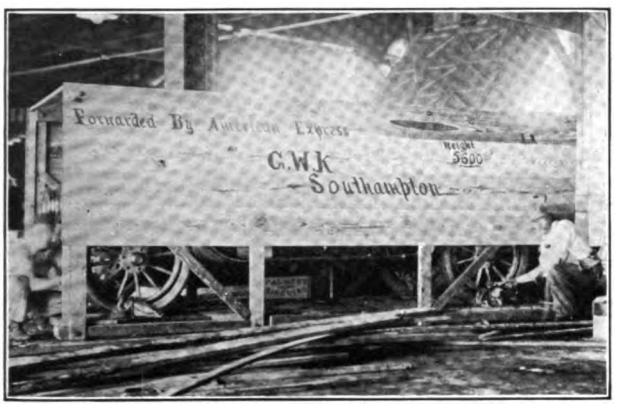

Fig. 5—Finish of the Enclosure, Boarding Up the Rest of the Sides and Top, Cleating with Two by Fours and Marking.

hand, ready to start out as soon as the car is unpacked.

The company handling this matter will also take care of the equally important one of boxing and shipping the car, should the owner desire to be relieved of this responsibility and work. This makes it possible to walk into the company's offices and forget the car until one disembarks abroad.

Next in order is the arrangement for a driving license, to enable the use of the car, after the desired country is reached. In general, there are three fees, the registration of the car, the owner's license and the driver's license. In some instances all three must be paid, in others two, and still others call for but one. England, for instance, calls for all three, the first costing a pound sterling, while each of the others amounts to five shillings, a total in American money of about $7.50. These papers are obtained by application to borough officers, arrangements being made in advance through the club. Two number plates are required, one front and one rear. An inland revenue tax of small amount must be paid by anyone using a car in the country for more than three months.

Other regulations are: That the driver must be more than 17 years old, red light must be shown in the rear at the right (instead of the left as here), illuminated at night, and two white lights in front.

In France, a driving certificate is secured on the payment of 20 francs ($4.00) and passing a short, partial examination as to competency. Club members may arrange to have an official waiting on the docks. Two front lights, left green in whole or part, right white, are required, also one rear light. A horn must be fitted, while sirens are forbidden in cities and towns. One rear number plate must be used, of a specified height. One peculiar French requirement is the fitting of a small brass plate to the dashboard, giving the name and address of the owner of the car, the absence of this being punishable by a fine. The car owner is also liable to be fined for emitting smoke from the exhaust pipe.

Switzerland can usually be gained by the presentation of the United States municipal or state driving license for indorsement. If for any reason, this be refused, the owner must make application on a printed form for driving certificate and circulation permit. Two front and one rear lights are specified, the former being green and white, as in France, and the rear, red. A Swiss peculiarity is that permanent address and next, temporary stopping place must be given upon request.

An American can drive in Italy for 15 days upon the presentation of his home license for indorsement by the customs official. A permanent or regular Italian driving and circulating license will be issued by the prefecture of police upon the submission of American license, an examination seldom being required. Horn and number plate are necessary, also green and white front lights and a rear lamp.

When the home license has been vised by a German consul, it will be accepted throughout Germany, but the same must be submitted to the police of the first large town or city visited. A tax is imposed for permission to travel, varying from 75 cents a day to $6.25 for 30 days. Lights, number plate and horn are required, the same as the others previously mentioned.

The other countries are practically the same as the foregoing, except that the Austrian time limit is three months, beyond which period, both car and driver are subject to a special examination. In Spain a circulation permit must be obtained from the civil government of the first province visited. No license is required in Belgium. Holland supplies an eight-

Fig. 6—Handling the Crate from a Lighter, Showing the Height and Power of the Shear Legs, Which Handle It.

day driving license fee; for a long stay, application must be made to the minister of commerce at The Hague.

Digitized by Google

One or more of the following forms of insurance should be carried from the time the car is shipped from New York City, until the return, if not at other

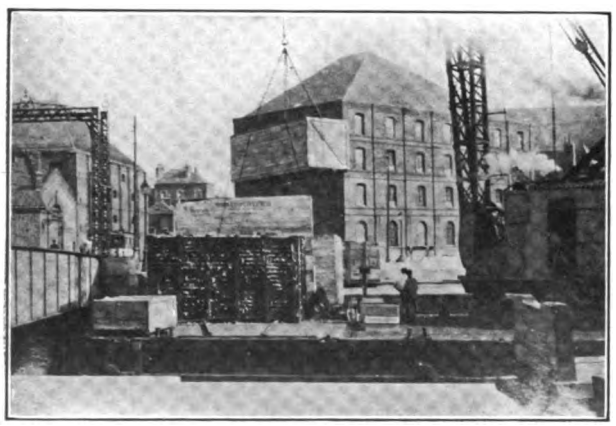

Fig. 7—Except for the Differing Aspect of the Docks, Cranes and Laborers, the Unshipping Process Abroad Is Just the Same. Scene in Havre Showing the Unloading of a Car.

times: Fire, burglar, theft and hazards of transportation; liabilities for injuries to persons; damages to car; damages to property of others; owner's insurance, and chauffeur's insurance. The fourth, in particular, is required in France and a number of other countries.

Coming finally to the car and its shipment, it must be crated or boxed and go as freight. As previously stated, all this bother and worry can be taken off the owner's hands by a good agent, who will attend to everything for him. Practically all of the express companies handle this class of business and are glad to get it. Notably, the Adams Express Company whose foreign representative, the Morris European Express Company, makes a specialty of this work. This concern is the official forwarder for the Automobile Club of America, and utilizes the Weinacht patented automobile case exclusively.

In this case, the car is packed as it stands; that is, without removing the wheels. Within the case, the car is held firmly by diagonals from the sills, as well as front and rear diagonals which prevent longitudinal motion. The arrangement of these diagonals is such that the weight is carried on the hubs, not on the wheels or tires. Each case is built in six sections screwed together. These crates are stored abroad and may be used for the return trip.

Freight charges on ocean steamships, at least on automobiles, do not go by the ton of 2240 pounds, but rather by the measurement ton of 40 cubic feet under "ship's option" privilege. This gives the ordinary automobile, unless another agreement is reached, a rating of 20 tons. An item often overlooked by those shipping to New York and other ports by freight, is the lighterage charges. In freight charges this is included, so an owner shipping to port by freight is entitled to free lighterage on a carload shipment.

Now as to the car casing, there are two ways, the crate with open sides and the case or box which is entirely enclosed. As the car will be in the hold of the vessel, it is only exposed to the elements while loading and unloading; a short time. This permits the open crate, if the owner desires. The box is much safer, however, as with an open side, a smaller crate or box placed close to it, may work in and do some damage.

Leaving that aside, the principal requirements are very stout, stiff corner timbers all around. Considering the average length of a car, the crate framework will approximate 15 feet long, and with a car weight of over two tons, there will be considerable stress upon it. No size smaller than four by four should be considered for all corners, sills and posts. Between these depending upon the total length, stringers of smaller section should be used, not smaller than two by four with the four-inch size in the direction of side stresses.

These will all have to be nailed up, diagonal nailing being preferable. It is well to go even further and set a corner piece into each junction of the four by fours, nailing this both ways to the larger timber. When all of the framework, excepting one end has been completed, the car may be run into this open end, after which it should be fixed in place with diagonals.

These should run from the axles to the end timbers in both directions, one pair being opposed to the other, and both being tight. Before these can be placed, however, the car should be jacked to position, and wedged there with a piece from above and below

Fig. 8—Sometimes Between Two Adjacent Countries the Car Can Be Shipped Without Taking Off Tires or Wheels, or Crating.

for each of the four hubs. When these and the diagonals have been set in position and fastened, the siding may be put on. When two by fours are used

Digitized by Google

for middle bracing on the sides, diagonals of the same section may be be run from one corner to the upper opposite one, one on each of the six faces.

The siding may be of ordinary one-inch stock, hemlock, like the siding on houses being all right for the purpose, although matcned lumber, set into each other and cross nailed is even stiffer and stronger. Anyone can crate an automobile, who is skillful with a hammer and saw, but it should not be tackled by anyone not seeking for plenty of hard and heavy work. At a low estimate, it will take the ordinary amateur carpenter, after all lumber and supplies are on hand, two whole days of 10 hours each to crate a motor car properly.

Considering all this, as well as the additional expense of transporting the boxed or crated machine to the steamship dock, it seems best to advise those who can manage it to have the work done. When the amateur does his own work, he should find out first of all the maximum sizes of the crate which the company's ships will accept, as cases have been known of this work having been done twice, due to neglect of this simple precaution.

MAY HAVE TOUR NEXT YEAR.

Such has been the interest aroused by Indiana manufacturers each year in their Four-States tour that the manufacturers of Michigan, and particularly those of Detroit, impressed by their competitors' successes, have under consideration a similar trip for 1913. If the present plans of the Michigen men materialize, the manufacturers of the state will tour neighboring states, and perhaps carry out a programme on a much larger scale than has ever before been attempted, covering more than four states. It is proposed briefly, that the makers combine to show their entire lines on such a run, stopping long enough to demonstrate every car. With the number of manufacturers in Michigan, such a tour, it is estimated, should bring an entry list of 100 to 200 cars.

ANNUAL OUTING FOR ORPHANS.

The Automobile Club of Pittsburg recently held its annual outing for orphans, supplying 150 gaily bedecked cars for the use of the children. Inmates of all of the orphanages in the city were given rides, some of the machines making eight to 10 trips to the outlying country.

DAILY TOURS BY FLANDERS.

One of the most generally discussed events in the history of Louisville, Ky., is the series of tours recently arranged there by W. H. Beeson, local manager for the Studebaker Corporation, South Bend, Ind., and the Louisville Herald. The tours lasted for 15 days, and were held in connection with a convention of trade "boosters." Daily trips were taken into the country, all persons applying at the offices of the Herald or the Studebaker salesrooms being accommodated.

The parties left Louisville each morning at 8 and the return was between 6 and 7 each evening, Lexington being reached about noon every day. In the trips from Louisville to Lexington and return, the following towns were visited: Shelbyville, Frankfort, Lawrenceburg, Versailles, Harrodsburg, Danville, Stanford, Lancaster, Nicholasville, Richmond, Winchester, Mt. Sterling, Carlisle, Flemingsburg, Millersburg, Paris, Cynthiana, Williamstown, Falmouth and Georgetown.

WESTGARD TO SEATTLE.

A. L. Westgard, American Automobile Association field representative, who left New York June 11, to lay out three new transcontinental trips, made rapid progress to Chicago, arriving there six days after the start. On his way, Mr. Westgard took notes of the detours necessary at present, particularly those due to new construction and repair work in New York State.

From Chicago west he took complete road notes to be issued in the form of new strip maps covering that route in detail. After working his way from Chicago to Milwaukee, St. Paul and Minneapolis, he laid out a route across North Dakota, Montana and into Washington. He planned to reach Anaconda, Mont., in time for the good roads convention, July 9. From Anaconda he was to go to Seattle, which will complete the first leg of his long journey, and for the first time provide complete notes from New York to Seattle by the most direct route.

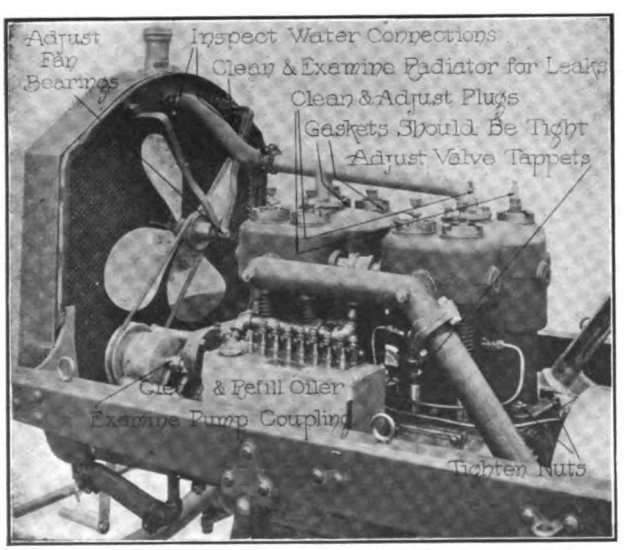
LENOX COMPANY NOT TO CHANGE.

The Lenox Motor Car Company of Boston, which for the past few weeks has been looking about for a new location for its factory, having had several sites in Boston, Everitt, South Boston and Stoughton, Mass., in view, has at last decided to continue its business at its present plant in Jamaica Plain. Considerable Brockton, Mass., capital is interested in the company, maker of the Lenox pleasure car, and practically all of the officers are from that city.

NEW LINE OF SPEEDWELLS.

The Speedwell Motor Car Company, Dayton, O., is planning a number of radical changes in its 1913 pleasure cars. The exact nature of these, the company is not ready to make public at present, but the new line will embrace both four and six-cylinder models of high power. The new car, the company asserts, will be even more generous in its line and the wheelbase will be longer than formerly. Some important improvements in mechanical designs are also promised. The working force of the Speedwell plant is being increased to carry forward rapidly the new pleasure car arrangements and to provide for the additional production of motor trucks.

Digitized by Google



Overhauling the Motor Car for Touring

By C. P. Shattuck

NOTHING detracts so much from the pleasures of touring as to have trouble with the power plant, transmission or other components of the motor car. The failure of a part through wear or inattention may cause considerable delay to say nothing of the work and expense involved in the repair. Invariably this will occur in the most undesirable locality and where the services of the expert repairman are not obtained easily. If the break be a serious one it may mean abandoning of the tour, at least as originally planned.

Those about to make their first tour often fail to take into consideration the fact that in operating over

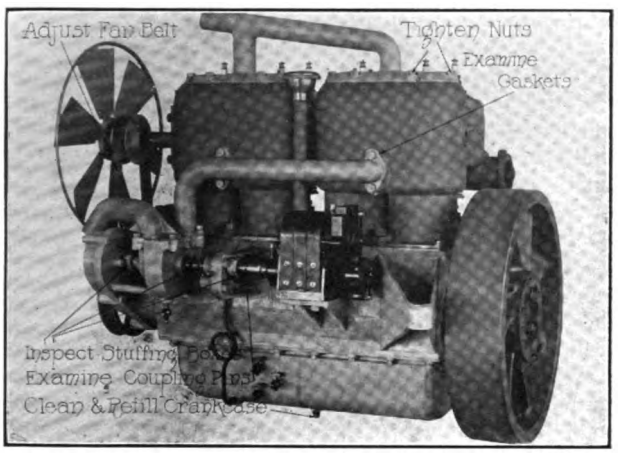
The Power Plant Should Be in the Best Possible Condition to Obtain Its Maximum Efficiency.

strange roads the car is subjected to stresses not encountered on highways where the driver is familiar with each hole and gully, and where rough and dangerous roads are traversed safely because of his knowledge of their location. Beautiful scenery will tempt the tourists to leave the beaten track and to explore new regions even though some parts of the roads do not permit of driving the machine on other than the low gear and require the frequent use of the brakes. Of course, this same argument applies with equal force to the other components of the chassis.

The successful completion of a tour depends largely upon the automobile and a moderate priced car is as capable of giving satisfactory service as a high powered machine provided, however, it is in a good operating condition and is given the proper attention both before and during the trip. While the new car will not need any attention other than grinding in the valves and a general inspection for loose nuts and bolts, the older vehicle and those which have been driven for some time since their overhaul, will require a partial if not complete renovation, this depending upon conditions. It must also be borne in mind that the automobile which appears satisfactory to the owner may develop weaknesses when subjected to the severe service demanded of it in the mountains, etc.

Although many will have this work performed at the repair shop or by the chauffeur there is a large number of owners who successfully complete this work and for the benefit of these and others the suggestions contained herein are made.

Inspection Should Be Thorough.



The inspection of all components should be thorough and if in doubt as to any part needing replacement through wear, a new one should be fitted. Makeshift repairs are unsatisfactory for although such may have withstood ordinary service it is poor economy to patch up a part which will undoubtedly break when subjected to a heavy stress. This applies particularly to the steering mechanism and brakes, and the motorist cannot be too careful in overhauling these and replacing any worn components. Driving conditions may be encountered which will severely test the material and construction and it is an excellent plan to forestall accidents.

The power plant should be placed in first class condition to obtain its maximum efficiency as this may be needed in negotiating long and steep grades which might not be climbed successfully on the second speed gear with the motor not in proper shape. Continued use of the low will test the cooling system and the radiator should be examined for leaks. If any exist the cooler should be removed and sent to an expert for repairs unless the owner is familiar with the work.

Digitized by Google

Remove Carbon Deposits.

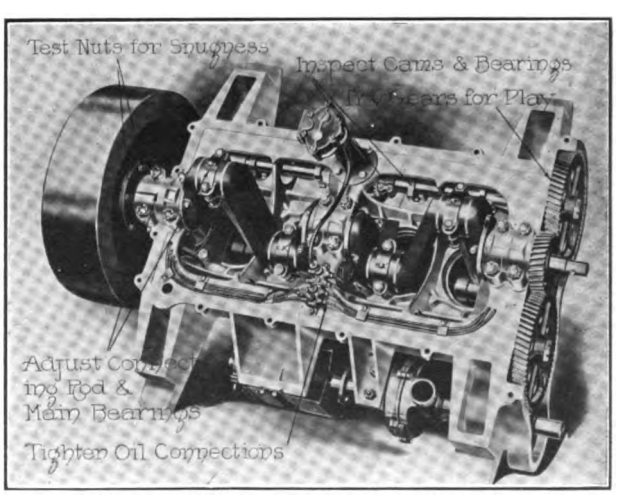
Starting with the motor, the first step is to remove all carbon deposits from the cylinders. It may

Depicting Magneto Side of Motor, Water Pump and Oiling System and Other Components Requiring Inspection.

be necessary to disassemble these to accomplish the work, and if so grinding in the valves will be made easier. After removing the valve springs they should not be mixed up as the intake and exhaust members are different on some motors and if not assembled properly the work must be repeated. After grinding and replacing the valves, springs and retaining members, the bearings should be examined for looseness which will necessitate the removal of the lower crankcase unless the members are accessible through inspection holes. In the former instance, the pan will have to be removed and it will afford an excellent opportunity of noting if the retaining bolts are in good condition or the shield in need of repairs. The connecting rod and main bearings should be adjusted if necessary and the wristpins given attention, taking care to set up nuts securely, and insert and fasten the indispensable cotter pin.

Retime Valves.

After replacing the cylinders, previous to which the piston rings are cleaned and set, the timing of the motor should be checked up by the marks on the flywheel. This work should be performed carefully and each valve adjusted separately to obtain the best results, after which the lock nuts should be set up hard. The crankcase is cleaned, replaced and refilled with fresh oil and the motor cranked to splash the lubricant to all working parts before switching on the ignition.

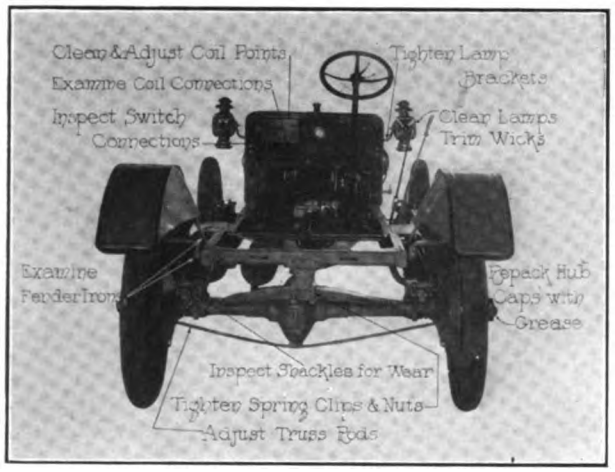


All gaskets, including the intake and exhaust members, as well as those utilized in connection with the circulating system, should be examined and if damaged replaced by new ones, and it is an excellent plan to paint those exposed to heat with graphite which will enable their removal without injury. In connection with this work it is suggested that extra members be made or purchased and stored in the tool kit in the event of trouble upon the road.

The general inspection of the power plant should include the water pump and coupling or key driving this member, as well as that actuating the magneto. If any retaining pins are loose they should be driven out and new ones fitted, taking care not to change the timing of the magneto in the operation. It is not advisable to tamper with the magneto and aside from lubricating according to the instructions of the maker, the amateur will do well to let this member alone. Any adjustments or repairs needed should be left to the expert.

Attention should be given to the spark plugs, both the battery and magneto, and these should be cleaned and the gaps adjusted and replaced, utilizing a little graphite on the threads which will prevent their sticking or freezing. Before leaving the power plant the bolts securing it to the frame should be gone over with a wrench and any loose members adjusted. The inspection should also include the starting handle and ratchet or pin.

Ignition and Carburetion.



Although the magneto is used generally, it is surprising to note the large number of cars which are fitted with a timer or distributor, coil and battery system, depending upon auxiliary cells for reserve current. With such an equipment it is vitally important that the timer or distributor be in good condition and any play should be eradicated by the fitting of new bushings. It may be possible that the roller, contact blocks and fibre of the timer are worn uneven and require truing in a lathe. If in good condition no attention other than cleaning and lubricating will be necessary, although it is advisable to examine the terminals and leads, replacing worn wires with new. The ignition and throttle leads and connections should be inspected for wear and all play eliminated.

Test Main, Connecting Rod and Camshaft Bearings, Adjusting Loose Members and Oil Connections.

While on the subject of ignition it is an excellent plan to clean the platinum points of the coil and readjust the vibrators not overlooking the secondary

Digitized by Google

Clean and Adjust Coil, Noting Whether Connections Are Secure, Also Look Over Truss Rods.

and primary wire terminals. The examination should also include the switch and the leads from the batteries. If storage batteries are utilized, either for ignition or lighting, they should be removed from the car, sent to the charging station and given a slow charge.

The carburetor will require but little attention if operating successfully although it is advisable to clean it thoroughly, taking care not to disturb the adjustments if possible.

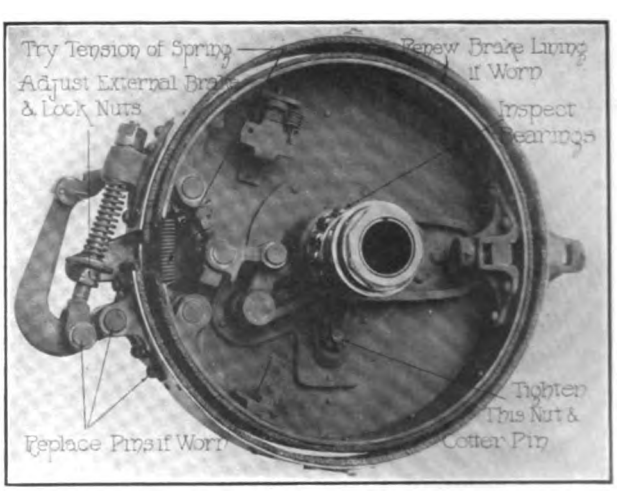
Clutch and Transmission.

The type of clutch utilized will determine to a large extent the work of overhaul as that employed with the planetary transmission will require but little attention unless badly worn. The adjusting of the high speed member, low and reverse, is made easily where bands are employed.

It is well to examine the lining of the cone clutch and if it has been slipping and does not yield to the oil treatment it is best to fit a new leather. The multiple disc will need cleaning, which is accomplished easily by draining out the old oil and refilling the case with kerosene, engaging and disengaging the clutch several times, after which operation it should be refilled with a lubricant recommended by the maker. It may be possible that the discs will require a slight adjustment.

Next in order is the transmission. Broadly speaking there is but little to be done if the gears and bearings are in good condition, other than remove the old lubricant and refill with new. If any of the gears are worn badly and do not mesh easily, they should be replaced by new members. The mesh may be tested by changing speeds and noting the action of the pinions. While on the transmission the shifting forks should be examined and adjusted if necessary and the lever and quadrant gone over carefully to insure that the components are tight and do not stick or bind in their operation.

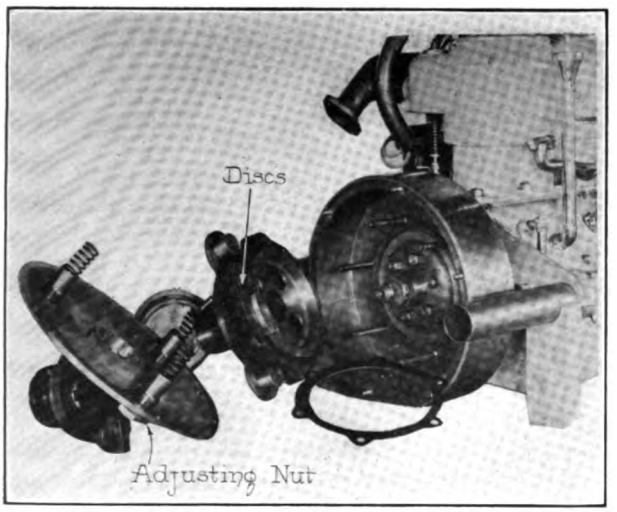
Universal joints are important and when these operate in grease packed in a boot, the latter should be taken off and cleaned. The universal members are next tested for wear and if play exists they should be removed and repaired, or new ones fitted. After completing the work the boots are replaced with plenty of lubricant.



Differential and Rear Axle.

Coming next to the rear axle, the first step is to remove the old lubricant from the differential case, which will be an easy matter if the member is equipped with a detachable housing. After cleaning out the old grease and flushing the case with gasoline or kerosene, the mesh of the crown and pinion gears should be tested and the teeth of both members inspected for wear. When the gears have been noisy they may be readjusted, if means are provided. Any end play of the driving shaft ought to be eliminated by adjusting the end bearing which should be inspected carefully. If the balls or races are worn, new ones must be fitted. Before leaving the differential, examine its bearings, making such adjustments as are needed.

Rear Wheels and Bearings.



As the rear wheels are subjected to severe stresses it is important that no play exist in the bearings and that these members be in good condition. To test for play, jack up the rear wheels and note carefully if any looseness exist. If the bearings have not been examined for some time it is advisable to remove the wheel which may require the services of a wheel puller. If ball bearings are employed, the races, cones and balls should be cleaned and inspected, and if worn new ones procured. Ball bearings should be packed with a non-acid grease and care exercised in the adjustment so as not to have the bearings bind. A general rule is to tighten up until the bearings seize, then slack off about half a turn and relock securely. If the wheels are secured to the axles by keys, these and the keyways should be examined for wear.

Before replacing the wheels, the brakes must be

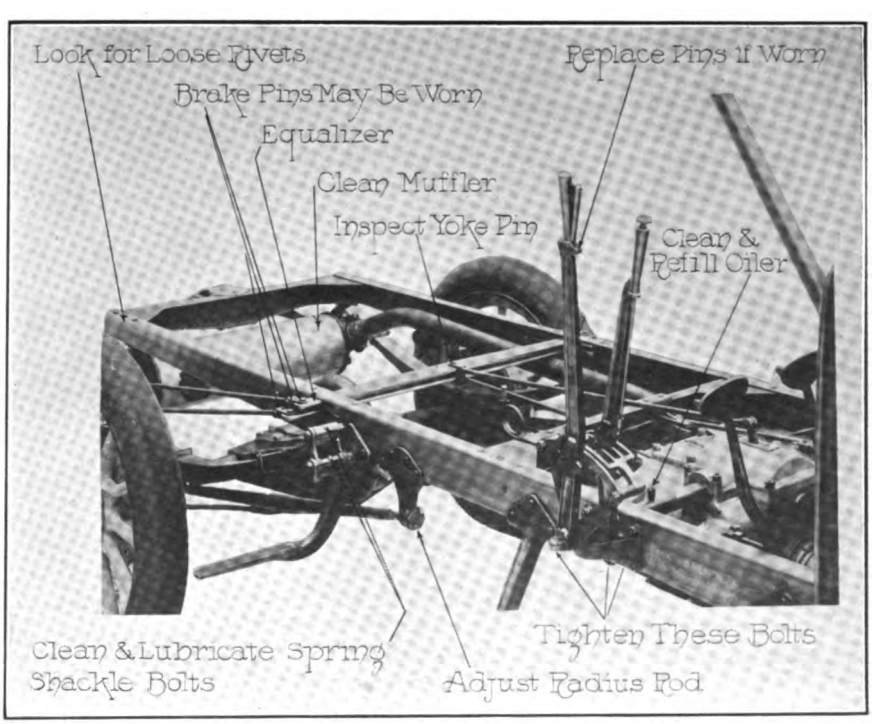
The Examination of Brakes Should Be Thorough as Much Depends Upon the Efficiency of These Members and Their Connections.

Digitized by Google

Multiple Disc Clutch Disassembled to Outline Its Components and Their Relation to Each Other.

given attention. One cannot be too particular regarding these members as their serviceability will be severely tested on the tour. If the linings are worn new should be procured and fitted, and in attaching the friction material the rivet holes must be well countersunk to obtain good results. If metal to metal is employed and these are worn thin, new ones will have to be fitted.

The springs also require careful inspection and if they have lost their tension the new linings will drag, burning the material as well as decreasing the power of the car. After relining the brakes these members will have to be readjusted and while doing this work examine the brake rods, equalizer and other components of this group, replacing any part showing signs of undue wear. Lubricate all working parts and before leaving the brakes test their operating mechanism, making certain that none of the components bind.



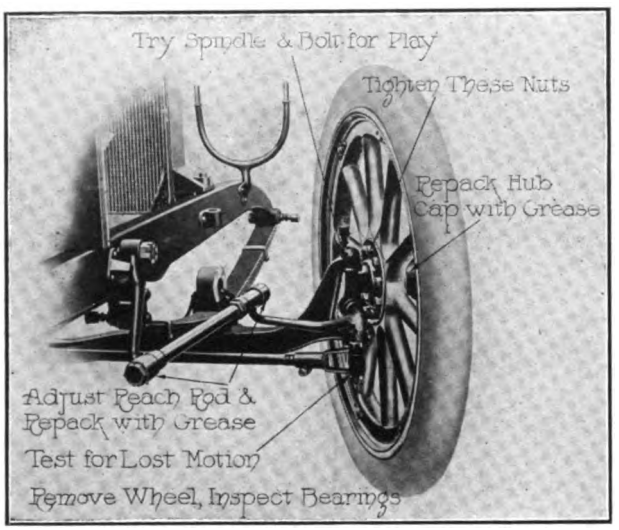
If the rear axle housing is fitted with truss rods, test for looseness and readjust. They should be snug, not too tight, the locking members set up hard and cotter pinned. The radius and torsion rods are important and irrespective of their design require careful attention and adjustment.

Before leaving the rear system, search for loose rivets in the housing and make sure that all nuts and bolts are tight, and that the spring clips and nuts are not loose. Springs, shackles and retainers should be gone over carefully and worn parts replaced with new. If the springs are rusty, pry apart the leaves, remove the dirt and lubricate with graphite and oil. It is surprising how much easier the machine will ride after the springs have been given this treatment. As many cars are equipped with shock absorbers these members should be given the attention recommended by the maker.

The frame and cross members should not be overlooked in the overhaul, especially if the machine has seen considerable service. Each rivet and bolt should be tried and if loose tightened up or replaced with a new member. The sub-frames carrying the motor and transmission should be included in the inspection and the bolts securing these units tightened. Go over the fenders and their irons carefully, taking up any play, and inspect the aprons as a loose bolt may be the cause of that annoying rattle.

Steering Gear and Front Axle.

The most important component of the chassis is the steering mechanism and the examination should be very through. Too much emphasis cannot be laid upon the necessity of disassembling the parts, inspecting each carefully and replacing any worn member with new. The reach rod and its connections should be gone over, tested for play and if not provided with means for adjustment, rebush the worn parts or replace with new. The tierod connections may also be worn creating considerable lost motion which may also exist in the spindles and pins. It may be necessary to procure new members or fit new bush-



In the Overhaul the Gear Shift Lever, Transmission, Radius Rods and Frame Should Not Be Neglected.

Digitized by Google

ings, this depending somewhat upon the design.

In reassembling these components plenty of lubricant should be utilized and before completing the

All Lost Motion Should Be Removed from the Steering Gear Connections and Bearings of Wheels Examined and Adjusted.

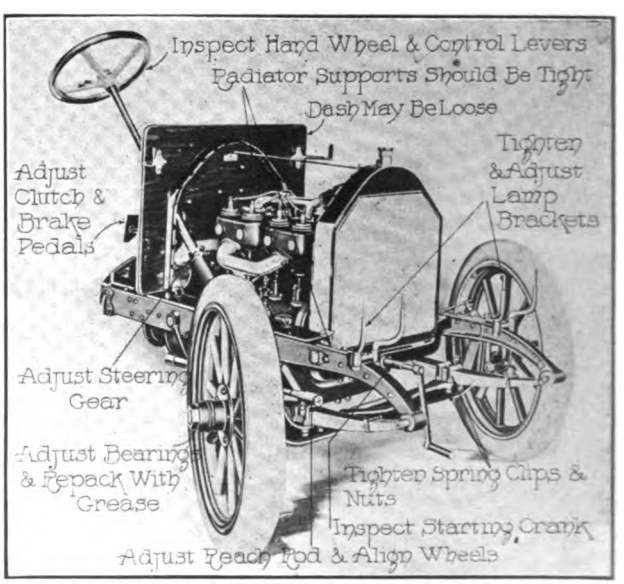
work, jack up both front wheels and turn the steering wheel in both directions, noting if the steering mechanism operates easily. If not, go over each part and readjust until the binding is eliminated. Leather boots are fitted to many of the connections and these should be refilled with fresh lubricant.

Front Wheels and Springs.

Having made sure that the steering gear is properly assembled and all parts locked securely, the front wheels and their bearings are next in order. The hub caps should be taken off and the old lubricant removed from these as well as from the bearings. Clean the latter with gasoline and inspect each ball, also the races and cones and locking mechanism. If the cones or races show signs of wear, purchase new ones, and in fitting these make sure that they are snug on the spindle and in the wheel hub. If any of the balls are pitted, replace with a new set. They are inexpensive and should be well packed with a suitable grease. In adjusting the bearings employ the same method as outlined with the rear wheels.

The front springs and their components should be treated in the same manner as the rear members, cleaning out all old lubricant from the oil or grease cups and refilling with new. The alignment of the wheels is important and should not be overlooked in the overhaul.

Before replacing the body, the tube and base supporting the steering column should be gone over and any loose bolt tightened, also those supporting the dash. As the muffler is accessible it is an excellent plan to remove it from the chassis and clean out all soot or carbon that may have collected. It will be surprising to note the amount of deposit the greater part of which may be removed by tapping the walls of the muffler with a wooden mallet.



Having completed the work of the overhaul the subject of lubrication is next to be considered. As various parts require a different form of lubricant and some more frequent attention than others, this information is presented in the form of a chart in an accompanying illustration which depicts each component of the chassis and which will be of value to the motourist when touring.

Care of Car En Route.

It should not be taken for granted that because the machine has been overhauled and placed in first class condition it will not require any attention while on the tour. It is an excellent plan at the completion of each day's run to go over car, tightening any nut or bolt that may be loose and to examine the steering gear and its connections as well as the wheels. These precautions will prevent annoying delays upon the road and when the start is made in the morning the owner will have confidence in his machine, adding decidedly to the pleasures of touring.

OHIO STATE ASSOCIATION.

At the recent annual meeting of the Ohio State Automobile Association, Dr. C. L. Bonifield of Cincinnati was re-elected president, and Dr. A. B. Heyl, also of Cincinnati, secretary and treasurer. Dr. Bonifield, who for years has been a leader among the automobile enthusiasts of his home city and of the state, is also president of the Cincinnati Automobile Club. The Kenton Automobile Club acted as host for the con-

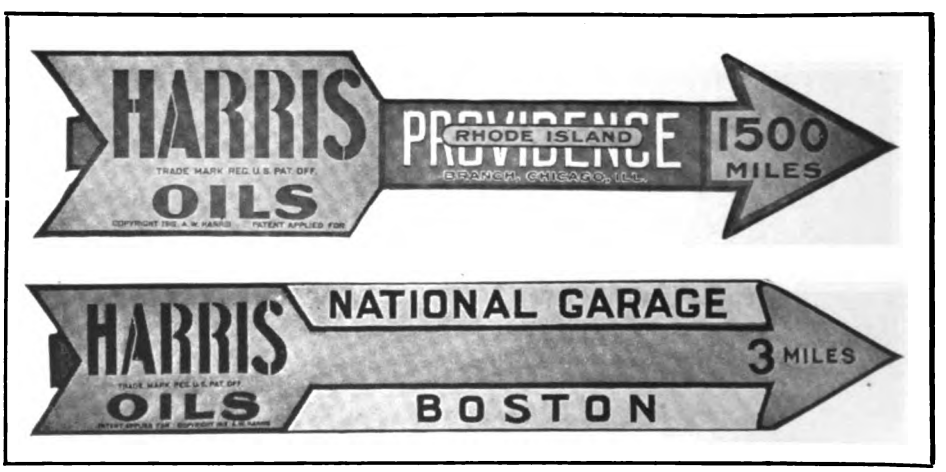
HARRIS OIL ROAD SIGNS.



A road posting campaign, which is bound to result in decided benefit to motorists and all others concerned, has been inaugurated by the A. W. Harris Oil Company of Providence, R. I., maker of the famous Harris oils for all forms of automobile, motorcycle, motor boat, and aeroplane lubrication. The plan is so unique that it merits more than usual mention. Some of the signs are presented herewith, but as they are handsomely lithographed in red, yellow and black, on substantial metal, these black and white reproductions hardly do them justice.

Harris Oil Signs—Symbol Arrows for Warning Motorists of Danger.

As will be noted the entire set includes master arrows, dealer's arrows and symbol arrows. The Harris company has applied for a patent and the signs are all copyrighted. The working of the plan is very simple.

The dealer's arrow, or as it is termed, the local wedge arrow, bears the dealer's name and the town with the mileage, and is designed for the purpose of informing motorists where supplies may be obtained. The master arrow gives directions and mileage to the larger towns and cities on the route, while the symbol arrows will prove of decided assistance to motorists in giving ample warning of approach to dangerous spots along the road. Inasmuch as all the signs are of long wearing material, the service will be permanent and of an enduring character.

Harris Oil Signs: Above, Master Arrow; Below, Dealer's Arrow with Information as to Where Supplies May Be Secured.

This splendid advertising proposition is open to all dealers, the A. W. Harris Oil Company bearing the entire expense. Those dealers interested will be supplied with a sufficient number of signs to meet their requirements. The plan is decidedly comprehensive and should prove of material assistance to the motorist, the dealer and the Harris concern.

The arrows are now being sent out and the demand from dealers is growing rapidly. The reputation of Harris oils is well known, and it is anticipated that this new advertising plan will assist in bringing it to the attention of tourists. This is an exceptionally good time to begin the work of installing the signs along the roads travelled by motorists.

LONG ELECTRIC MILEAGES.

At a recent luncheon of the Electric Vehicle Club, of Boston, two men told some interesting stories of the long mileages they had obtained in electrics. One, J. E. Savill, stated that in 1903 he built an electric runabout with a battery which covered 108 miles on one charge, but that the speed was only eight miles an hour. The battery had thin lead and zinc plates. I. A. Kuhn, of the Babcock Electric Vehicle Company, reported that for some time he had been engaged in testing a number of sizes of electric roadsters and touring cars in Chicago and Boston. He stated that with a standard five-passenger touring car he had covered 175 miles at a speed of 15 miles an hour, over the boulevards of Chicago. At 21 miles an hour he covered 112 miles. Both times he carried the full complement of passengers. In Boston and over roads between that city and Marlboro he made 103 miles with a roadster, at a speed of 19 miles an hour, and used only 180 ampere hours out of the battery's capacity of 200. He contemplates making other mileage tests in the near future, covering roads of all sorts, and they will be watched by owners of electrics with great interest. An electric recently covered 975 miles in eight days, on one charge each night. This record was made in New York state.

WOMEN'S MOTORING COATS AND BONNETS.

Garments Designed for Driving, or for Combination Purposes, of Substantial Materials and in Models That Have the Approval of Authorities on Dress.

THE woman who motors learns with experience what is best for practical use in the way of apparel, but there is a vast difference between choosing what can be worn and what had best be worn insofar as appearance, comfort and economy are concerned. It is not to be denied that for those who have no reason to consider difference in values the exclusive creations by women's tailors and modists will make the strongest appeal, and with such garments individuality is the keynote, but there are many thousands who must regard expense where there are few who do not, and it is for this class that these suggestions are made.

Considered from any point of view the motor woman has a wide range of choice in clothing. Each season the increasing use of motor cars and the necessity of garments adapted partly or wholly to driving has impelled an attention from the designers, the makers and the manufacturers of garments, so that there is to be found in practically all of the shops dresses, waists, skirts and all manner of coats and wraps, that are well made, have good appearance and have many, if not all, of the qualities that are desirable for automobile wear.

Relative to exclusive designs it is certain enough that these may be no more serviceable than those that may be worn generally, but as the possession of something that another cannot well obtain carries with it a prestige, it is not probable there is any argument that will prevail against desire to be attired in garments of this character. Of course when specially made clothing is regarded on the basis of service; that is, actual endurance, it no doubt has much to recommend it, but it would be a daring woman who would care to appear often in the same attire, and she would desire to change the effect so far as this could be done. Considered from this viewpoint, that much of the motor outfit cannot be worn more than a season without at least material changes, it is perhaps better to assume that the ready-to-wear garments that can be adapted for general purposes are economical in more ways than one.

Three-Quarter Length Motor Coat of Polo Cloth, Rose and White, Buttoned.

Questions of Economy.

It is a fact, however, that certain clothing may be worn for more than a single summer or autumn, provided that it is chosen with a view to serviceability rather than style, and with the requirements for warm, cool and cold weather a woman may accumulate a wardrobe of considerable proportions and yet not go beyond the bounds of prudence and economy.

The motorist whose driving is confined to afternoons or evenings and whose outings of this character are incidental rather than continuous, cannot well afford to spend a considerable amount in garments she may wear but casually, and if she is wise her wraps are such as may be appropriate to numerous occasions, or at least may be worn generally to some extent, because if limited to motoring alone she would hardly be justified in any expenditure. It is best where such a condition obtains to select what will be most useful and to confine one's self to what may be termed combination apparel.

In the selection of garments the motorist will find at many of the shops dresses and coats that may be made very useful and which may be appropriate for wear in the car and on the street. This does not mean that one is necessarily limited as to style, for it is possible to purchase decidedly pleasing models and in a great variety of fabrics. In fact, to examine the showings of the more pretentious stores is to be surprised at the attention given to motoring apparel, and at the designs that have been created especially for automobile use. But as a rule outer clothing is specialized, and this leaves to the purchaser a choice from any number of gowns that may be adaptable to wear while with the car.

Selection of clothing that will serve for the occasional drive, or the frequent ride for a day or evening,

Digitized by Google

is not a difficult subject, for it can be safely said that a suitable hat or bonnet and a coat that will cover the gown is sufficient for ordinary requirements. The chief essential is protection of the dress and the hair, for it is assumed that any woman will safeguard her face and eyes against the burn of the wind and the sun and the ravages of dust as her own experience teaches her is best. So far as the dress beneath is concerned there is a wide range for choice because some women will drive an entire day and alight from the car as fresh and as free from evidences of travel as though they had not been in a car. Others will have the appearance of a constant battle with wind and sun and a generally dishevelled aspect that may be applied to every article worn. There is no question, however, that with care in dressing any woman may drive the entire day and reach a destination reasonably presentable, and without a soiled and travel crumpled gown.

Three-Quarter Length Motor Coat, of Polo Cloth, Blue and Plaid, Open.

The Matter of Packing.

The experienced traveller by automobile does not prepare for a motor tour as for a journey by any other conveyance. She realizes that she is decidedly limited as to number of garments she can conveniently carry unless a trunk is sent by express, and as luggage of this character must be looked after and packed and repacked each day, its care becomes more of a burden than it is a convenience. Not only this, a trunk cannot be well sent in this manner unless an itinerary is maintained, and this prohibits variances that might be especially desirable and go to make up much of the pleasure of automobile travel. And besides, few women would care to have really nice clothing crushed and crumpled from being packed for a considerable length of time.

There is no end of garments that might be appropriately worn, but there is little doubt that the simple tailored effects, in fabrics that will not fade from the sun, which will not be affected by a shower, which will resist the soil of dust and will retain their shape, will find the greatest favor. Light colors are delightful in appearance, but they soon show the stains of travel, and there is nothing more undesirable than a dress or coat of a color that will emphasize uncleanliness.

Concerning One-Piece Gowns.

There are simple one-piece gowns that may be worn with much satisfaction, or the skirt and coat that may be utilized with the shirt waist of differing materials, any of which may be approved, whether for the road or the more or less informal occasions to be met with at the hotels or with friends, because there is a license for travellers as to variety of wearing apparel. For wear in the car it is certain enough that the fabric should be selected that will not be too heavy or heating during the extreme heat of the day, and yet will be reasonably warm in the cool of the morning or the evening, because at the shore and in the mountains a considerable change in temperature may be expected.

Of course it is essential to supplement the dress by coats, which really establishes the light weight as the desirable in fabrics, and this may include the light weight serges, whipcords, diagonals, homespuns, knob-homespun, tweeds and fancy mixtures in the woolens; khaki, corduroy and some of the dependable silks. Of these, the serges, whipcords and homespuns make admirable skirts and coats, being sufficiently diversified as to color to meet the approval of all, and these may be made up to the idea of each individual in whatever effect may be desirable.

Three-Quarter Length Motor Coat, of Novelty Mixture, Silk Lined, Buttoned.

One of the qualities of the serges and fabrics of a similar character is that they may be cleaned readily if soiled and when they are properly shrunken before making they will not shrink when wet by rain. Not only this, a woolen garment will always resume its shape when pressed, and no matter how often it

Digitized by Google

goes to the tailor it will always return appearing fresh and attractive. Brushing will remove all the dust and good material will not fade when worn in the sun. No matter how well one may be protected it is difficult to prevent dust from reaching one's clothing and so it is well to select that which will be the least affected by the usual causes for deterioration.

Full Length Motor Coat of Blue Diagonal Serge Trimmed with Robin's Egg Blue.

In making up the travelling wardrobe the gowns to be worn outside of the car should be of materials that will not suffer in appearance through packing. Cotton and linen will remain creased from folding, and the lines can only be obliterated by pressing, which treatment is not always practicable. It is exceedingly annoying for a woman to arrive at a destination for the day and find the garment she desired to wear so unsightly that its use is impossible, although it was packed with care and reasonable precaution taken. It is far better to rely upon gowns of foulard, of pongee silk, of Japanese silk, of rajah and tussah, for these may be rolled and placed in the auto trunk with a confidence that when taken out they may be shaken into shape and will have all their original freshness and charm. Dresses of pattern silk have all the practicality of the others and these may be sufficiently ornate to be serviceable at any ordinary function. Gowns of the materials suggested that are adapted to the use of the motorist may be bought at most of the good shops, and care should be taken to select models that are so trimmed that they will not suffer in appearance through packing. Where the gowns are made they should be designed with the same purpose in mind. In carrying out this idea self-trimming is to be recommended wherever possible.

In this connection it should be borne in mind that where one is touring one cannot expect to have more than two or three gowns at the most in the ordinary luggage, and light colors should be avoided on general principles for those that will better resist the evidences of use. In the event of a rainy day when one may be confined to a hotel or to the house it is well to have appropriate attire, unless one is willing to appear in the regular garments worn in the car. Necessity will develop the resourcefulness of the woman in dress, to be sure, but where provision can be made for such conditions as may be reasonably anticipated it is well to consider probabilities. It has been suggested that with two silk gowns that can be worn for differing occasions, a motoring dress and an extra skirt, a woman can make a tour of considerable length and make a satisfactory appearance, which would seem to indicate that good judgment in a choice of several garments is in every way more desirable than a selection of a considerable number.

Where the dress that is to be worn in the car is limited to a single suit, and perhaps an extra skirt, the belted coat with Norfolk effect may be regarded with approval, and if of tweed, or a mixture, or of serge, waists of linen or silk may be worn if desired, these being preferably of colors that will the least show wear, but the one-piece gown has an advantage in that it will not evidence use as will the waists, although it may not have the same effect. The single garment also eliminates the perishable collars unless lingerie effects are desired.

Combination Rain and Dust Motor Coat, of Cravenetted Worsted.

For those who desire effect white garments of woolen fabrics, such as serges, corduroys, broadcloths, and even linen may be worn, but these would hardly serve those who may travel hundreds of miles by car. They are striking when used for afternoon or evening wear, and they may be fairly protected, but a single day on the road would perhaps end their serviceability. The same comment may be made of the fabrics of delicate tones, which may be worn about the shore or in the mountains, and yet would be decidedly unserviceable for any extended or constant use.

Digitized by Google

As to the colors that are permissible for gowns, that is a subject which can best be determined by the motorist herself. There are shades and tones that are the vogue, and yet the combination that can best be made is not to be determined by the judgment of another nor the effect obtained, although it is possible that the suggestions might be helpful. Yet striking and effective as garments may be it is not to be assumed that these will be given uniform approval.

Motoring Dust Coat of Gray Mohair, Double - Breasted, Desirable for Touring.

It is imperative, however, no matter what the opinion may be relative to dress, that the travelling coats and wraps be of a type that will not only be serviceable, but will afford every desired protection against the elements and the conditions to be met with during the motor journey. Incidentally these may serve equally well, no matter whether the drive shall be of a few hours or for several weeks. The requirements for all occasions do not differ greatly.

Sweater Coat Desirable.

One of the most useful garments that can be carried, which may be worn under an outer wrap is a sweater coat. These may be purchased in any desired quality, color or length, and of differing weights. While comparatively light they have a degree of warmth that makes them especially desirable when the air is chilly, and being snug fitting and elastic they are comfortable without bulkiness and conform to every movement of the body. Covered with a coat that will resist the penetration of the wind they are especially warm, and worn with a rain garment a sweater is really all that is needed for ordinary summer touring comfort. A sweater will endure all kinds of hard usage, it may be rolled or folded or stowed wherever circumstances will permit, and it will lose nothing in appearance. Sweaters may be tubbed and cleaned as often as desired, and they will always retain their shape.

Wool is one of the best of materials because of the warmth and its elasticity, but silk makes an ideal garment, and knitted coats of silk have endurance and elegance that highly commend them. The long sweater is the better for automobile service because it will give greater protection, and naturally the tones that will the least show the stains of use are to be preferred. One of the most desirable sweater coats is that knitted from silk and having three-quarter length, and these may be had with different collar designs, some being adapted for closing to the throat and giving a full protection, while others are more pretentious and perhaps not as practical.

It is not out of place to have one garment that has tone and dignity that may be both suited to the motor car and to more or less general wear, and such a coat may serve when going about between drives, when the atmosphere is chill, as may be experienced at the shore and the mountains. It may be packed with reasonable certainty of it retaining its shape and attractiveness, and it should be of fabric that may be cleansed readily. One of the really artistic garments, that may be worn by the majority of women, is a new three-quarter length motoring coat of polo cloth, this being a thick, but light and soft fabric of wool. This material is two faced and among those displayed at the stores of the Shepard Company, Providence, R. I., recently, were models of rose and white, lavender and white, black and white, navy and plaid and plain black, the lighter color being the inside of the garment.

Black and Gray Silk and Mohair Dust Coat, a Striking and Stylish Garment.

The coats are formed from a single piece of fabric and there are no seams, the shoulders being wide and loose with the collar wide and meeting the front edges to form a deep notch. The sleeves are long and are inset with deep lap seams, and are finished with deep cuffs showing the darker color. The revers and the collar are of the lighter

Digitized by Google

tone so that when the collar is turned up and the coat closed at the throat only the outer color is seen. The patch pockets at the side are made with lap seams and there is a shield of the contrasting color turned over on the patch, giving a lapel effect. The coat is trimmed with silk braid at the edges and about the cuffs, which are rounded at the sleeve seam, this matching the front effect, where the corners are cut rounding. With the combinations with white and a contrasting color the silk braid is white, and with the navy and plaid, and the plain black, the braid is black. When closed the coat is buttoned with four large pearl buttons, stitched with four smaller buttons on the reverse, so as to bring no strain upon the fabric. In the back it falls full from the shoulders. When opened the collar is turned further onto the shoulders and the front has a soft roll that extends nearly to the knees. Two of these models are shown, the one of rose and white and the other of navy and plaid, the former closed and the latter open.

Handsome Motor Dust Coat of Black Mohair, with Yoke and Collar, to Be Worn Closed.

Novelty Mixtures.

Another particularly effective motor coat of the popular three-quarter length was also displayed by this firm, this model being of a fabric known as a novelty mixture, loosely woven, light in weight and yet exceedingly warm. This material is in combination color effects of gray and light blue, dark and light brown, dark and light tan, and dark and light navy blue, the first mentioned tone predominating in each instance.

Like the garments previously described the coat is formed of one piece of fabric and there are no seams, the front folding deeply so as to afford good protection at the throat. The corners at the front are more nearly square and the garment when buttoned has a complete bottom line about the figure. The shoulders are broad and the sleeves are inset so as to give perfectly easy fit, the sleeves being long and loose and finished with a very deep cuff. The collar is rather narrow and there is no notch, the revers being wide and formed with the collar.

This garment is lined throughout with satin of the darkest shade of the material and this lining is exposed when the collar is turned down and the coat is open. The coat is closed with five buttons, three close together below the waist line, one at the throat and the other at the bust. The wide right rever is buttoned across the throat, as is seen in the illustration. The patch pockets are deep and are finished with a square shield. The coat is loose and falls full from the shoulders, there being no restraint of the body in any position.

Combination Garments.

A third model that attracted decided attention was a combination motoring and street garment of light weight that was intended for protection of the gowns and to have a reasonable quality of warmth. This is of navy blue wide wale diagonal or serge, cut loose and full, and falling smoothly from the shoulders to the bottom of the skirt. The back is formed to have a loose, one-sided effect with a deep plait and is caught with two buttons at the waist line. There are three seams, one under each arm and a third forming the plait. The front fold is very wide and the corners are square. The collar fits snugly about the neck and this is faced six inches deep with robin's egg blue serge, the ends falling straight forward onto the bust and being finished with two large button holes at either end.

Motor Dust Coat of Light Tan Repp, an Extremely Serviceable and Durable Wrap.

The sleeves are loose and long and these are finished with deep cuffs of the same material as the collar, the cuffs being rounded at the sleeve seam and ornamented with a large tab lined with blue satin and buttoned on to the cuff. The shoulders of the coat are lined with the same material to afford additional protection. When the coat is

Digitized by Google

closed it is buttoned with two buttons below the waist line, the revers being unusually long and wide. It may be closed at the throat with a third button, and the collar may be closely wrapped about the neck if this is desired. The buttons are large and are of smoked pearl.

An admirable model of a combination rain and dust coat was also shown, this being a handsome black and white checked, hard-finished, cravenetted worsted, cut loose and roomy to fully protect any gown that might be worn. This coat has the quality of not showing dust, may be perfectly cleaned by brushing, will shed rain, and while light has a warmth that will permit its use, with other garments, at all seasons. It is made with three seams, one under either arm and the other at the back. The back seam is finished with a long vent. The garment falls loosely from the shoulders and it is fashioned with a rather deep notched collar and wide revers. It has side vents for lifting the skirt and the two large side pockets have vertical vents. The long sleeves may be gathered about the wrists by tabs that are caught with buttons. The sleeves and the pocket vents are ornamented with black buttons, and six buttons are used to close the coat, the collar buttoning close and being caught tightly with a hook and eye.

A dust coat that is appropriate for all motoring, and which will amply protect the wearer, is of mohair and it may be obtained in navy blue, gray and tan, that which is illustrated being gray. Like garments of this character it is full and loose, hanging from the shoulders and reaching the bottom of the gown. It is made with a one-piece back and with a seam under either arm. It is fitted with a wide hand made notched collar that fits close to the throat, and may be hooked tightly if desired. The revers are long and wide and there is a generous fold at the front, the garment being closed with a double set of three buttons which are set at the right side, giving a double-breasted effect. The front facings are deep and the long sleeves are finished with a deep, square cuff, having a rounded corner. The patch side pockets are made with a square lapel effect.

Another dust coat that is decidedly serviceable is a loose, roomy garment of silk and mohair and it may be had in either black or gray. It is cut fairly full with two side and a centre back seam and falls straight from the shoulders to the hem of the skirt. The front fold is very wide and this gives unusual protection to the throat and the chest of the wearer. The sleeves are long and full and are finished with a deep cuff. The collar is close fitting and is very wide, with the loose ends falling at either side of the neck. The lapel is notched and there is a rever extending to the waist line where the coat is closed with four buttons that give a double-breasted effect when buttoned into the long buttonholes, which are reinforced with black taffeta. The patch side pockets have a square shield, that is unusually deep.

A striking motoring coat is of mohair and in black only, this being loose in fit and made with three seams, there being a deep vent at the back. The collar is deep and rounding and it covers a yoke that extends about the shoulders, with large tabs that fall over the upper part of the sleeves. The yoke is slightly curved over each shoulder at the back and circles the neck and is carried to the edge of the front, the collar being loose above it, yet closely fitting. The shoulders are wide and the sleeves full and long, having a large, deep cuff caught with a single button. The pockets are of the patch pattern and have a shield effect with a shield lapel. The coat is closed with three large celluloid buttons set below the waist line, and by two buttons at the throat, these buttoning the outer end of the yoke and the fold of the garment below it across the bust.

Another especially durable and pleasing dust coat is made of a light tan repp, this being a closely woven cotton fabric that is mercerized and is very smooth and soft, with sufficient weight to be warm and give considerable protection in the event of a sudden chill. This model falls freely from the shoulders, with two side and a centre back seam, with no vent. The collar is wide and heavy and it is made to fit closely about the throat and protect the gown beneath. It is deeply notched. The coat has a wide front fold and deep facings, and when it is open it has a long and graceful roll. The pockets are with vertical vents and the cuffs are plain and are fitted with dust protectors and finished with a tab for closing the sleeve closely about the wrists. The garment is lined across the shoulders and chest to the waist line.

With these models of coats are shown three types of motoring bonnets, the first of which is a helmet and is an imported creation of Paul Poiret of Paris, being intended to afford perfect protection for the hair and somewhat shield the eyes. It is extremely light and is formed of a thin patent leather in a deep bowl shape, the border being ornamented with white French hemp. In the centre of the front there is an ornament formed as a pompom with the lower portion of shirred white ribbon and with black feathers rising above the top of the crown.

Of the other two both are of practically the same type, being suited for the automobile or steamer wear. These are made in changeable taffeta silks, the combinations being blue and green, brown and tan, red and blue or black and green, these being of the envelope effect with a little cape at the back to protect the hair, or a longer streamer that falls at the back for the same purpose. There are sidefolds that may be brought closely under the chin and clasped with a snap button. There is a slight brim that protects the eyes, and the head and throat save the face is completely enclosed and shielded from the dust, the bonnet being light and extremely comfortable.

Ed. Note—The Automobile Journal is indebted for the above detailed descriptions and for the photographs to the Shepard Company, Providence, R. I., these being chosen from its ready-to-wear departments.

NATIONAL CONTEST AND RACING NEWS.

Boillot Wins French Grand Prix---Bruce-Brown Disqualified for Taking on Gasoline---Second Annual Four-States Tour Starts---Knox Enters for Vanderbilt Cup---Results in Various Meets---Ford Wins Hill Climb.

For the first time since 1908, the French Grand Prix race was held over the Dieppe course, June 25-26. The distance was 956 miles, 20 laps, of a 47.8-mile course, 10 laps being covered the first day and 10 the second. David L. Bruce-Brown of America, driving a Fiat car, finished the first half of the contest in the lead, but was disqualified the second day, because he took on gasoline outside of the regular pit.

The race was won by Boillot of France in a Lion-Peugeot, his time being 13:58:02, or at the rate of 68.7 miles an hour. Second place went to Wagner of France in a Fiat in 14:11:08, averaging 67.8 miles an hour. Bruce-Brown was third, but the prize was awarded to Rigal of England in a Sunbeam, his time being 14:38:36. Bruce-Brown's time was 14:28:13.

In the light car class, three Sunbeams, driven by Rigal, Resta and Medinger, finished in that order, their respective times being 14:38:36, 14:39:51 and 15:59:41. The only other car to finish was an Excelsior of Belgium, driven by Christaens, his time being 16:23:38. Others were still running.

All three winning cars in the larger event were equipped with Bosch magnetos, a source of much gratification to the Bosch Magneto Company, New York City.

MAINE'S RELIABILITY CONTEST.

The three-day reliability tour covering 446 miles from Portland, Me., under the auspices of the Portland Sunday Telegram, last month, brought out nine cars, four of which finished the test with perfect scores. The first day's run was from Portland to North Conway, N. H., with night stop at Gorham, N. H.; the second, from Gorham to Skowhegan, Me., with night stop at Bangor; and the third, from Bangor to Augusta and return to Portland. The standing of the contestants at the finish was as follows: Mitchell 6, Jackson 7, Stoddard-Dayton 8 and Stearns-Knight 9, perfect; Jackson 3, 11 points; R-C-H 2, 31 points; American 10, 93 points; Oakland 4, 240 points.

NATIONAL STILL HOLDS RECORD.

After considering the Santa Monica road race and the races on the Los Angeles motordrome, May 4 and 5, the contest board of the American Automobile Association has issued the following statement: "The time made by various cars in both the Santa Monica road race and the motordrome events were not accepted and allowed as official records for the reason that the board has not yet been able to secure possession of the original printed ticker tape of the timing apparatus used to record the times in these two events." This means that the world's road record made by Harvey Herrick in a National car in the Santa Monica road race of 1911 still stands as official, despite the fact that Teddy Tetzlaff in a Fiat exceeded this mark very materially this year.

In connection with the matter of racing records, the board has failed to take into account the work done by De Palma's Mercedes in the recent 500-mile race and has adopted the following as official speedway records, regardless of class, created in that event:

Miles	Car	Driver	Time
100	Fiat	Tetzlaff	1:13:37.25
150	Fiat	Tetzlaff	1:49:52.84
200	Fiat	Tetzlaff	2:25:50.52
250	Fiat	Tetzlaff	3:07:13.94
300	National	Dawson	3:48:39.30
350	National	Dawson	4:25:15.27
400	National	Dawson	5:04:14.23
450	National	Dawson	5:44:04.54
500	National	Dawson	6:21:06.03

DEFEATED DRIVERS GET PRIZES.

It will be remembered that the management of the Indianapolis motor speedway offered 12 prizes for the 500-mile race of Memorial Day, but inasmuch as only 10 cars finished, it was anticipated that the 11th and 12th awards would revert to the speedway. It has been decided, however, that the 14 drivers who tried and failed should receive some recognition for their work. Accordingly the management has divided these two awards among these as follows: De Palma, Mercedes, $382.34; Burman, Cutting, $301.54; Dingley, Simplex, $222.87; Matson, Lozier, $211.34; Wishart, Mercedes, $176.76; Anderson, Stutz, $153.70; Liesaw, Marquette-Buick, $138.34; Disbrow, Case, $128.73; Marquette, McFarlan, $121.04; Herrick, Case, $103.75; Richenbacher, Firestone-Columbus, $82.62; Bruce-Brown, National, $49.95; Knight, Lexington, $13.46, and Ormsby, Opel, $13.46.

FORD WINS ALGONQUIN CLIMB.

The seventh annual Algonquin hill climb, held under the auspices of the Chicago Motor Club, June 20-21, was won by Frank Kulick in a Ford, made by the Ford Motor Company, Detroit. Two grades were utilized, the first being that known as Algonquin hill

Digitized by Google

proper and the other Phillips hill. The latter is exactly .5 mile in length. The summary follows:

Car	Driver	Algonquin Time	Phillips Time	Total
Stock, $1201-$1600.				
Bergdoll,	Monsen	0:43:0	0:58.0	1:01.0
Non-Stock, Under 161 Inches.				
Herreshoff,	Wordingham	0:38.8	0:47.8	0.86.6
Non-Stock, 161-230 Inches.				
Mason,	Duesenberg	0:18.0	0:31.0	0:49.0
Ford,	Kulick	0:17.6	0:31.8	0:49.4
Non-Stock, 231-300 Inches.				
Mercer,	Schillo	0:18.0	0:31.0	0:49.0
Case,	Nikrent	0:20.0	0:30.4	0:50.4
Colby,	Ogren	0:25.4	0:40.8	0:66.2
Non-Stock, 301-450 Inches.				
Ford,	Kulick	0:51.6	0:28.2	0:43.8
Stutz,	Moore	0:21.8	0:32.0	0:53.8
National,	Schetnitz	0:25.0	0:36.0	0:61.0
Non-Stock, Under 600 Inches.				
Ford,	Kulick	0:15.4	0:27:2	0:42.6
Mason,	Duesenberg	0:18.2	0:29.8	0:48.0

Stutz,	Anderson	0:22.0	0:34.4	0:56.4
Colby,	Ogren	0:24.6	0:41.4	0:66.0
Non-Stock, Free-for-All.				
Ford,	Kulick	0:15.8	0:28.4	0:44.2
Mason,	Duesenberg	0:18.0	0:30.0	0:48.0
Mercer,	Schillo	0:18.4	0:31.0	0:49.4
Colby,	Ogren	0:22.2	0:35.2	0:57.4

TWO NEW SPEEDWAYS COMING.

The Dallas Motor Speedway Company has been organized in Dallas, Tex., with capital of $250,000. The aim of the company is to construct a two-mile speedway which shall be even superior to that at Indianapolis, Los Angeles, Atlanta or Cheyenne.

The Metropolitan Motor Speedway Association, with capital of $1,500,000, has been incorporated in New York City. It is announced that the concern has taken over 300 acres on the Jersey meadows near Newark, and that ground will be broken in the near future for the construction of a motor speedway. It is planned to hold a 500-mile race as an opening event, July 4, 1913. It is understood that included among the stockholders are A. R. Pardington, Fred J. Wagner, E. E. Hoyt, Theodore F. Keer and W. H. Osborne.

ANNUAL FOUR-STATES TOUR.

Some 35 cars left Indianapolis, Ind., July 9, on the second annual Four-States tour of the Indiana Automobile Manufacturers' Association, which will include visits to the principal cities in Indiana, Kentucky, West Virginia and Ohio. The tour is not in the nature of a contest, as such events usually are considered, but is intended as a means for introducing the product of Indiana makers to the people of the section covered. Ample opportunity will be offered for demonstrations en route, following the plan inaugurated a year ago.

The entries for the 1912 event were as follows:

Great Western Pathfinder and Pilot Car in the Indiana Four-States Tour, Heading the Parade for Second Annual Event in Indianapolis.

Nyberg Auto Works, Anderson, three Nyberg pleasure cars and one Nyberg truck; Maxwell-Briscoe Motor Company, Newcastle, three Maxwell cars; Henderson Motor Car Company, Indianapolis, one Henderson; American Motors Company, Indianapolis, three American cars; Service Motor Car Company, Wabash, two Service trucks; Great Western Automobile Company, Peru, two Great Westerns; Motor Car Manufacturing Company, Indianapolis, two Pathfinders; Marion Motor Car Company, Indianapolis, two Marmons; Premier Motor Manufacturing Company, Indianapolis, two Premiers; Nordyke & Marmon Company, Indianapolis, two Marmons; McFarlan Motor Car Company, Connersville, two McFarlans; Haynes Automobile Company, Kokomo, two Haynes cars; De Tamble Motors Company, Anderson, two De Tambles; Cole Motor Car Company, Indianapolis, two Cole cars; Double Fabric Tire Company, Auburn, one car.

A Cole and a Premier were selected as official press

Digitized by Google

cars. These will occupy much the same position as an advance agent, preceding the other contestants and making arrangements for demonstrations, etc. The Great Western, which laid out this year's route, is acting as pilot car for the tour.

KNOX FOR VANDERBILT CUP.

The first entry for the 1912 Vanderbilt Cup race has been filed by Ralph Mulford, who will drive the Knox machine, made by the Knox Automobile Company, Springfield, Mass., and driven by him in the recent 500-mile race on the Indianapolis speedway. Now that the entry blanks have been issued and the dates have been selected, it is expected that the list will increase rapidly.

The dates are as follows: Grand Prize, Sept. 17; Pabst and Wisconsin challenge trophies, Sept. 20; Vanderbilt cup, Sept. 21. All events will take place on the so-called Greenfield course, under the auspices of the Milwaukee Automobile Dealers' Association.

RESULTS AT NARBERTH.

Several withdrawals marked the meet at Narberth, Penn., June 29, as evidenced by the fact that although there were 10 entries for the 50-mile race, only four started. The summary follows:

Five Miles, 161-230 Inches.

Car Driver	Time
Buick, Bauer	6:02.4
Cartercar, Baker	.....
Empire, Smith	.....

Five Miles, 231-300 Inches.

Bergdoll, Homan	6:00.8
Mercer, Morton	.....
Mercer, Ringler	.....

Ten Miles, 301-450 Inches.

Kline-Kar, Menker	9:55.0
Stutz, Blocksom	.....
G. J. C., Millchap	.....

Fifty Miles, Free-for-All.

Kline-Kar, Menker	53:39.0
Stutz, Blocksom	.....

Ten Miles, Handicap.

Fiat, Frietag	10:50.0
Empire, Smith	.....
Schacht, Gray	.....

Ten Miles, Consolation.

Empire, Smith	5:39.0
Schacht, Gray	.....
Mercer, Ringley	.....

BOSCH IN ALPINE TOUR.

Twenty-two cars finished the strenuous 1445-mile Alpine tour of the Vienna Automobile Club in Austria, June 23, with perfect scores, and of these, 21 were fitted with Bosch magnetos, according to the Bosch Magneto Company, New York City.

ENTERS FOR GALVESTON BEACH.

Neil Whalen has made the first entry for the beach carnival meet at Galveston, Tex., Aug. 8-10. He will drive the same National car, made by the National Motor Vehicle Company, Indianapolis, Ind., with which Leonard Zengel won the Elgin trophy last year. It is now owned by Fred Cummiskey of New York City.

BURMAN REGAINS BRASSARD.

After holding the Remy grand brassard for one week and drawing the weekly salary accompanying it but once, Louis Menenghetti lost the award to Robert Burman in the meet at Laurel Park, Washington, D. C., June 28-29. The results follow:

FRIDAY, JUNE 28.

Three Miles, Remy Brassard.

Car Driver	Time
Benz, Burman	3:20.0
Benz, McDonald	.....
Warren, Barber	.....

Twenty-Five Miles, 600 Inches.

Cutting, Burman	27:32.0
Ohio, Raimey	.....
Lozier, French	.....

Five Miles, 161-230 Inches.

Warren, Barber	6:15.0
Reo, Stewart	.....

Five Miles, 231-300 Inches.

Ohio, Raimey	5:37.0
Kline-Kar, Fairman	.....

Five Miles, 451-600 Inches.

Cutting, Burman	5:22.0
Kline-Kar, Menker	.....
Lozier, French	.....

Five Miles, Free-for-All.

Benz, McDonald	5:14.5
Kline-Kar, Fairman	.. ..
Lozier, French	... .

SATURDAY, JUNE 29.

Five Miles, 161-230 Inches.

Warren, Barber	6:07.6
Reo, Stewart	.....
Warren, Blair	.....

Five Miles, 450 Inches.

Ohio, Raimey	5:55.0
Warren, Barber	.....
Mercer, Blair	.....

Five Miles, Special.

Mercer, Blair	6:04.5
Warren, Barber	.....
Reo, Stewart	.....

Three Miles, Remy Brassard.

Benz, McDonald	3:11.2
Benz, Burman	.....

Five Miles, 600 Inches.

Benz, Burman	5:34.0
Ohio, Raimey	.....
Warren, Barber	.....

Five Miles, Free-for-All.

Benz, McDonald	6:05.5
Warren, Barber	.....
Ohio, Raimey	.....

Eight and One-Half Miles, Pursuit.

Benz, Burman	8:19.2
Ohio, Raimey	.....
Warren, Barber	.....

Three Miles, Remy Brassard.

Benz, Burman	3:06.2
Benz, McDonald	.....
Mercedes, Menenghetti	... .

MEETING EMERGENCIES ON THE ROAD.

THOUSANDS of automobilists now undertake successfully long tours with no other knowledge of the motor car than of operation, fuel and lubrication. This has been made possible by the perfected product of the manufacturer and the owner of the modern machine starts on his journey confident that he will reach his destination in scheduled time. There are, however, many motorists whose means are limited and who invest in a second hand car, which, although apparently may be in good condition may be subject to those weaknesses which have been overcome in later models. It is not to be assumed that if the car has been overhauled properly weaknesses will develop on the tour, but minor mishaps such as ignition, carburetion, etc., are probable, and for the benefit of those lacking in experience the suggestions contained herein are made. Lack of space prevents detailed instructions and those given are of a general nature calculated to aid the owner when in difficulty and where the services of the expert are not obtainable.

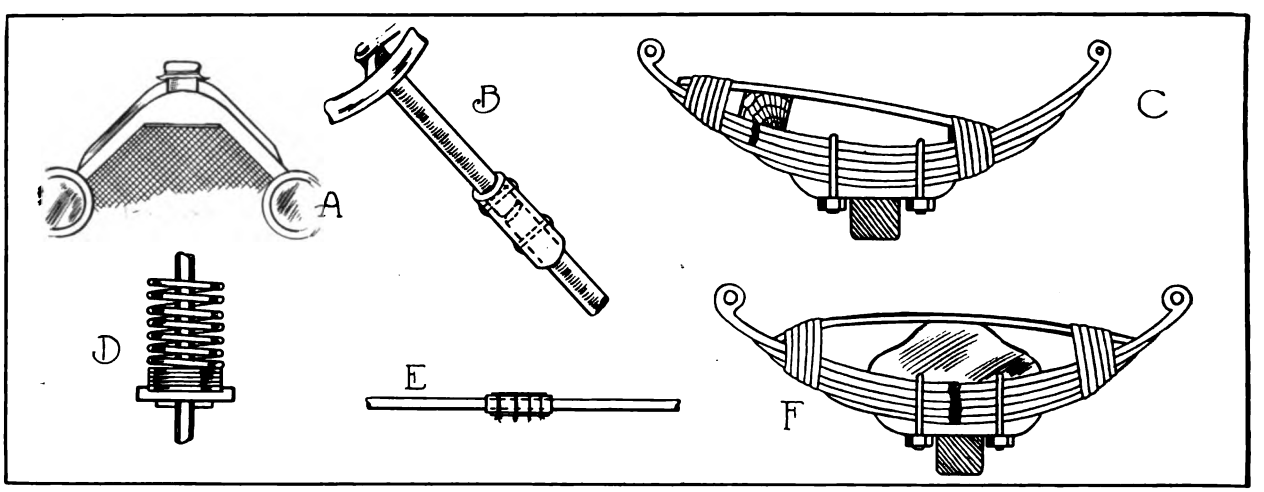

Fig. 1—Some Suggested Emergency Repairs: A, Fitting Chamois to Replace Lost Radiator Cap; B, How to Repair Broken Steering Column, Tie or Reach Rod; C, Method of Mending Spring Broken Near Its End; D, Building Up Broken Valve Spring; E, Splicing Broken Fuel Pipe; F, How to Repair Spring Broken in Centre.

Ignition Troubles.

With the general utilization of the magneto the motorist seldom experiences ignition troubles other than with the plugs and when these members fail to perform their function it is due usually to excessive lubrication or too rich a mixture. Magnetos operate satisfactorily for thousands of miles without any other attention than lubrication and should not be tampered with as very few drivers are capable of repairing these instruments. The general instructions of the maker should be adhered to and aside from adjusting or cleaning the contact points the device should be left alone.

It may happen that a cylinder will miss occasionally and if current is supplied by a high-tension magneto or one utilizing a step-up coil, the spark plugs will have to be short circuited, one by one, until the faulty member is located. This may be accomplished by taking a screw driver with an all-wood handle and making a connection with the metal blade between the terminal of the plug and cylinder. This will cause the current to flow through the screw driver instead of the electrode of the plug. By noting the explosions of the motor it may be determined if the plug being tested is at fault. If not the remaining members may be examined similarly.

If the plug appears to be at fault and a new one does not cure the trouble, try one that is working properly, and if the cylinder continues to miss, test the secondary wire. This is done by employing the screw driver as above outlined except that one end of the blade is held within .25-inch of the cylinder. If a spark fails to materialize, inspect the wire for chafed or broken places and examine its connection at the magneto. If broken at the latter place, a temporary repair may be made by inserting a cotter pin to which the wire may be attached, taping the connection to prevent possible short circuits.

Locating Faulty Ignition.

Where a coil is employed the troublesome cylinder is located more easily as by holding down all vibrators but one the faulty member will be noted readily. It may be possible that the platinum points are not adjusted properly or have become pitted which will require cleaning and resetting. If the system includes a battery, the work will be facilitated by attaching one end of a wire to the steering column and the other in contact with the primary post of the coil, or in other words, the terminal to which is secured the wire leading from the timer. This will close the primary circuit enabling the vibrator to be adjusted easily without cranking the car.

Digitized by Google

Broken down insulation is responsible for many mysterious ignition troubles and the secondary wires should be gone over carefully and any suspected places taped. It is surprising how easily a high-tension current will leak through defective wires some of which appear to be in perfect condition. In searching for ignition troubles it is an excellent plan to be systematic, starting from the source of current and tracing each lead carefully, rather than by guessing as to the cause.

Difficulty on Starting.

Dry cells or storage batteries are employed for starting and through considerable service or improper installation may deteriorate, creating difficulty when the spark is weak and the mixture thin. If the storage battery becomes exhausted the only remedy is to have it recharged. Dry cells, however, may be revived temporarily by perforating the zinc cover and moistening the members, taking care not to immerse the terminals. If a very weak spark be present and it will not start the motor, inject a little gasoline in the cylinders, creating a richer mixture, which is easier to ignite than a thin one. If the batteries fail entirely, and the motor cannot be started by spinning on the magneto, the only resort is to push the car along with the clutch in, having the switch lever thrown to magneto. If on a down grade it will be a simple matter to start by this method.

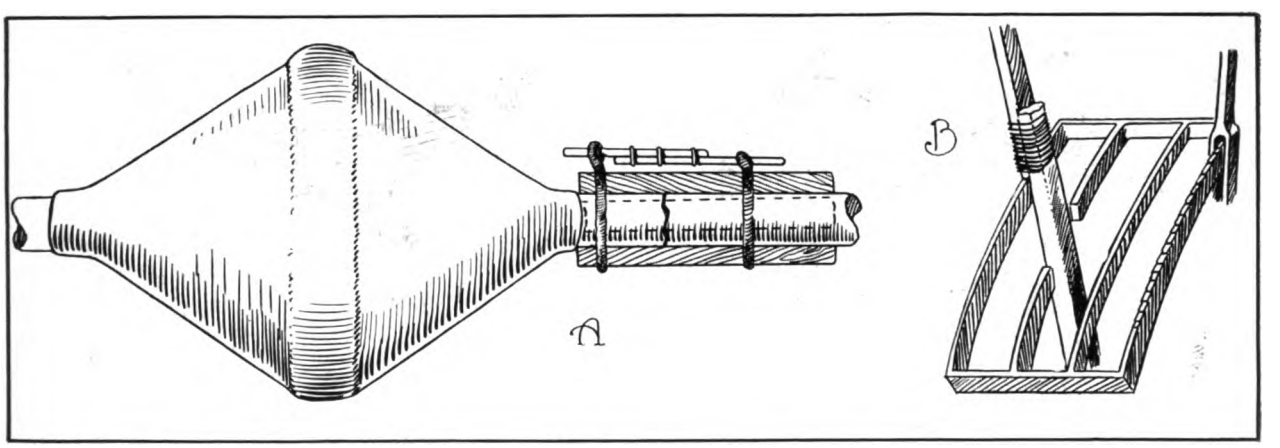

Fig. 2—Other Emergency Repairs: A, Depicting How Broken Axle Housing Was Spliced, Enabling Driver to Reach Nearest Garage; B, Method of Replacing Broken Gear Shift Lever.

Carburetor Troubles.

Briefly speaking the carburetor should not give any trouble if the member is adjusted properly and the driver is careful to have all gasoline strained. Failure to do this will breed difficulty, as dirt will find its way into the needle valve opening while water will prevent vaporization of the fuel and may cause the motor to stop. The error made by the majority of drivers, and some repairmen as well, is to assume that the vaporizer requires readjusting when the motor lacks efficiency or does not operate smoothly.

When the carburetor is suspected of being the cause of trouble the drain cock should be opened and a small quantity of gasoline drawn off, noting if it be clean or if water be present. Close the cock and flood the carburetor by priming and drain off some more fuel, after which restart the motor and the trouble may disappear. If dirt has lodged in the spraying nozzle, open the needle valve a full turn, taking care to note the original adjustment, and start the motor or crank it vigorously, as this treatment will remove ordinary stoppages. Sometimes a larger piece of dirt gets in and acts as a valve, stopping up the nozzle when the throttle is opened, in which event the fuel passages must be cleaned.

As a weak battery presents similar symptoms, do not disassemble the carburetor until sure that the device is at fault. Although many motorists study their instruction books relative to the adjustment of carburetors, they are unfamiliar with the location of the components utilized and at Figs. 3 and 4 are outlined several types of well known vaporizers with the adjusting members clearly depicted.

Adjustments for Altitude.

Although carburetor manufacturers have made considerable progress toward perfecting these devices, they are more or less susceptible to changes of altitude, such as in the mountains high above the sea level. It is a common occurrence for a driver to note that his motor lacks power when operating in high altitudes and where the air is rare and light. Under such conditions the setting of the device must be changed and one of the leading carburetor manufacturers states that the only adjustment necessary is to the air valve.

When operating in high altitudes the tension of the air valve spring should be loosened, or the device controlling the admission of air regulated to admit more atmosphere as a larger amount is required to take care of the gasoline and to keep the mixture uniform. As the atmospheric pressure decreases, the amount of air must be increased and in proportion with the altitude, as valves controlled by a spring respond less readily. Some concerns make it a practise to fit dash devices, whereby the air member may be controlled from the seat. As the majority of

Digitized by Google

vaporizers are provided with adjustable air valves, the owner should be able, by careful experimentation, to solve any carburetor troubles due to altitude.

Motor Troubles.

If the operator follows the instructions of the maker relative to the lubrication of the power plant no trouble should be experienced with it, but lack of oil combined with continued driving on the low or intermediate speed when ascending grades, may result in a burned-out connecting rod or main bearing. If the former be at fault, the cylinder may be removed, disconnecting and taking out the connecting rod and piston. While this may not appeal to some motorists it will be more advisable to finish the trip on three cylinders than to incur a large repair bill through operating with a damaged rod. If the main bearing be burned out, the car should be towed.

Minor Troubles.

Minor mishaps may occur, such as the loss of the radiator cap. At Fig. 1 A is presented a suggestion of utilizing a piece of chamois, wrapping it over the filler cap and tying with a piece of string. Should the fuel pipe become broken through accident it may be repaired temporarily by slipping a piece of rubber tubing over the broken ends and splicing with small strips of wood as depicted at E. A chafed place in the line can be stopped from leaking by the application of a little soap and tape or string. Should a bad leak occur and the contents of the fuel tank become lost, progress may be made by utilizing the emergency can of fuel, connecting this member to the carburetor by a rubber pipe and syphoning the fluid to start its flow. If the can cannot be secured, one of the passengers will have to hold the member.

Broken Valve Spring.

In the event of a valve spring breaking or losing its tension, it may be remedied by building up with washers as suggested at D, or by employing a piece of gas piping if accessible. In connection with valves it must be remembered that a mysterious missing of a cylinder may be due to a sticking stem. A little kerosene will remove the trouble and it is a good plan to carry a can of this lubricant. Broken valves will require replacing with new members and these should be ground in if possible.

It is rare that a steering post, tie or reach rod breaks, but in the event of an accident and when the machine is some distance from the nearest repair shop, the broken member may be patched up by taking a piece of gas or water pipe, slipping it over the ends of the broken part, drilling through the material and driving in and peining over pins as outlined at B.

Care of Radiators.

The radiator seldom is given the attention it requires and many cases of overheated motors are due to neglect of the cooler, which should receive as much care as any other component of the chassis. Clean water, distilled or rain, is preferable as hard water forms a scale and reduces its efficiency. The circulating system should be drained off at least once a week to remove any possible sediment and the fins of the cooler kept free from mud or dirt. For emergency repairs in the event of leaks, use chewing gum, putty or wood. A raw potato has been utilized with success. Bran, flaxseed, flour, etc., should never be placed inside the radiator to stop a leak.

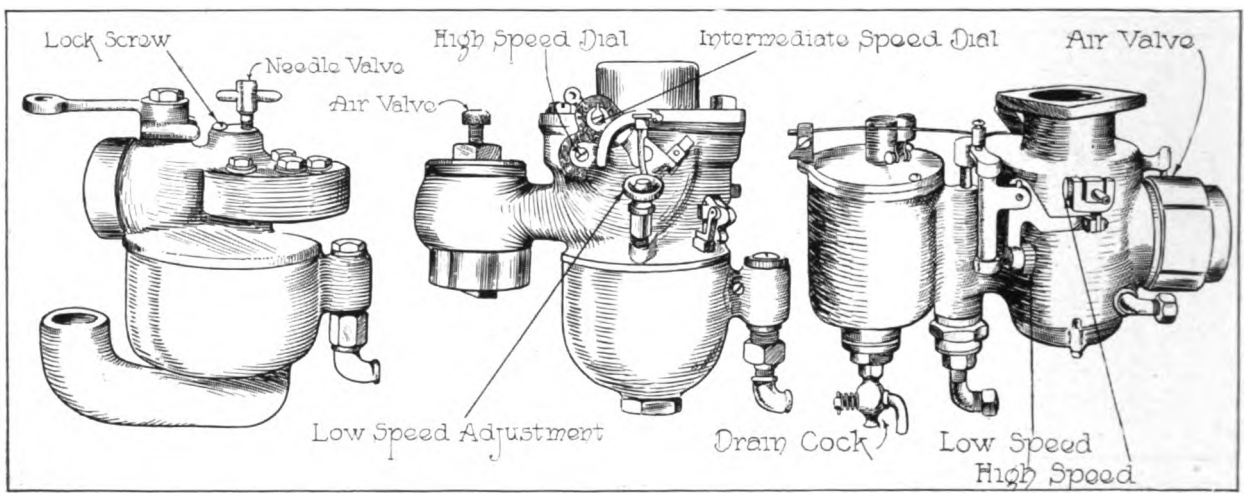

Fig. 3—Outlining Conventional Types of Carburetors and Their Adjusting Mechanism: From Left to Right, Kingston, Schebler and Rayfield.

Broken Springs.

Broken springs are not uncommon, but they should not prevent the completion of the day's run, for they may be repaired by several of the accessories made for this purpose or by utilizing the suggestions depicted at C and F which show a method of repairing a break near the end and in the centre. A hard wood board, from one to two inches thick and about five in the centre, is nailed to a block of wood. The frame of the car is next jacked up to relieve the weight and the ends of the board bound tightly to the springs

Digitized by Google

with straps, rope or wire. A repair can be made by interposing a large block of wood between the frame and axle, to take the entire weight. This remedy is practical when the spring is badly damaged.

Should the gear shifting lever break through a defect or accident the hint outlined at Fig. 2 B will be of service. Procure a strip of hard wood and of suitable length, trim and fit it to the stump of the lever by wire or straps. If wood is not handy, the emergency brake lever may be disconnected and utilized in a similar manner.

Broken Axle Housing.

The method of repairing a broken axle housing, shown at A, was noted by the writer recently, and by it the driver was able to travel several miles to the nearest garage. Four pieces of heavy wood were utilized as splints around which were twisted ropes, these being tightened by using a small strip of wood and tying the ends as outlined. Fortunately, such accidents rarely occur to the modern automobile.

Tire Chain Hint.

In touring it is probable some poor roads may be encountered and it is possible that deep sand or mud will make traction difficult. If the tire chains applied in the usual manner fail to extricate the machine, remove them and wrap them around the tire. This kink will start the car out of deep sand or mud. If this suggestion does not result in success, the shovel and boards will have to be utilized.

If the tour includes territory well away from the beaten track and where the repair shop is not available, it is an excellent plan to have the equipment more complete and at least it should include a rope which will be of service in the event of trouble. The experienced motorist who is familiar with his machine will undertake the tour with a less equipment than the novice who should study carefully the contents of the instruction book or consult the agent as to equipment.

TIRE SALES IN MILLIONS.

That the volume of pneumatic tire sales in 1912 will be approximately $120,000,000 is the opinion of those in close touch with conditions in the automobile industry. This figure has been secured by basing the estimate on the number of cars in use and their probable tire requirement. There are nearly 600,000 cars in use in the United States at present. Figuring six tires to a car for 12 months of service, the manufacturers' basis of estimate, it will be seen that approximately 4,000,000 tires will be required. Figuring the tires at an average cost of $30 each, an aggregate of $120,000,000 is shown.

"These figures are not far from correct," says J. M. Gilbert, general manager of the United States Tire Company, New York City. "That 1912 will be by all odds the banner year of the tire industry is already an assured fact. For more than a year our four big factories have been running day and night. The result is that, whereas last season we never were able to catch up to our orders, we are prepared this year to take care of everybody."

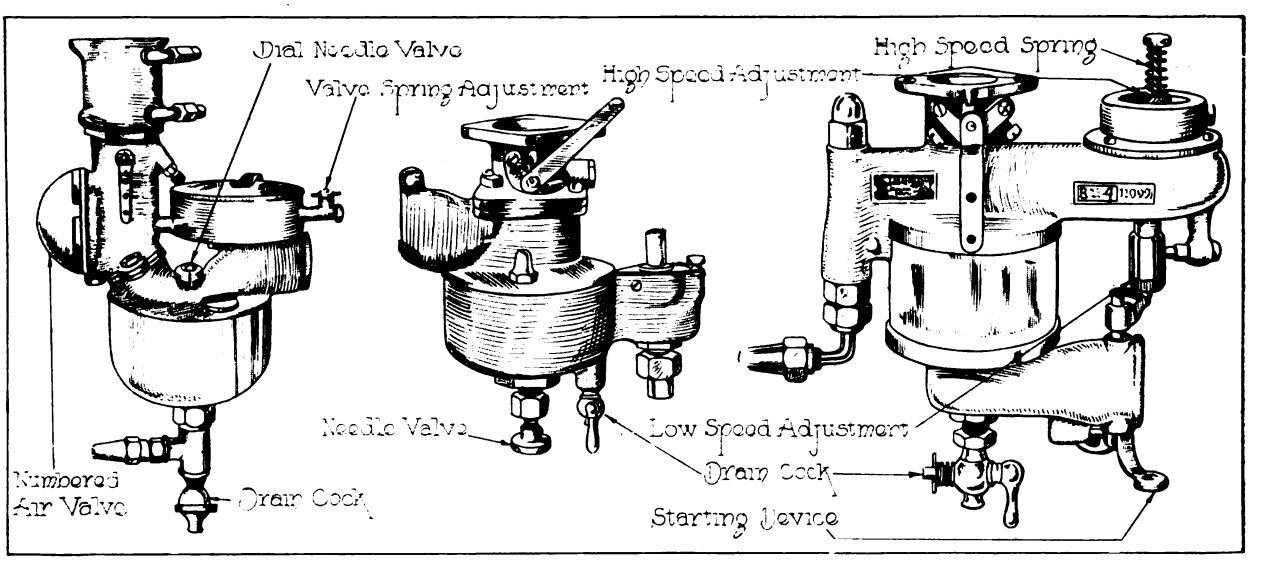

Fig. 4—Depicting Other Types of Carburetors and the Components Utilized in Adjusting: From Left to Right, Excelsior, Holly and Stromberg.

LOLLY BECOMES REMY ENGINEER.

W. H. Lolly of London, England., has been appointed engineer in the service department of the Remy Electric Company, Anderson, Ind. Mr. Lolly is well known among the engineers of this country. On coming here, he was connected with the Remy concern, then left to join the forces of the Connecticut Shock Absorber Company, returning to his former employers a short time ago. Another announcement by the Remy company is that Arthur H. Berndt will become manager of the Indianapolis branch, Sept. 1.

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

Claude Grahame-White, the English aerial hero, who won the second international race at Belmont Park, Long Island, in 1910, and Miss Dorothy Taylor, daughter of Mr. and Mrs. Bertrand Leroy Taylor of New York City, were married in London June 27. The wedding was an aerial event, in almost every sense of the word.

The bridegroom flew to a point near London the night before, while many of the guests, well known aviators in England and France, followed his example the next morning. The bridal party received its guests under a floral aeroplane on the lawn of the bride's uncle, Sir Daniel Gooch, at Hylands, near Chelmsford, after the ceremony. B. C. Hucks, in a Bleriot monoplane, hovered over the party on the way from the church, showering the members with confetti.

Lieut. T. D. Milling and Passenger in Burgess-Wright Biplane from Which New Aerial Gun Was Tested Recently.

In a recent test of the aeroplane gun invented by Lieut.-Col. I. N. Lewis, U. S. A., Capt. Charles De Forest Chandler repeatedly hit targets three yards by 15, and in less than a minute sent 50 bullets into a target two yards by 20. He was flying in a Burgess-Wright biplane, flown by Lieut. T. DeWitt Milling, and the machine was travelling at the rate of 60 miles an hour. The gun weighs 25 pounds, and is said to have no recoil and no flame. Its capacity is rated at 750 shots a minute. When in use it is strapped at the muzzle to the foot stirrups of the aviator.

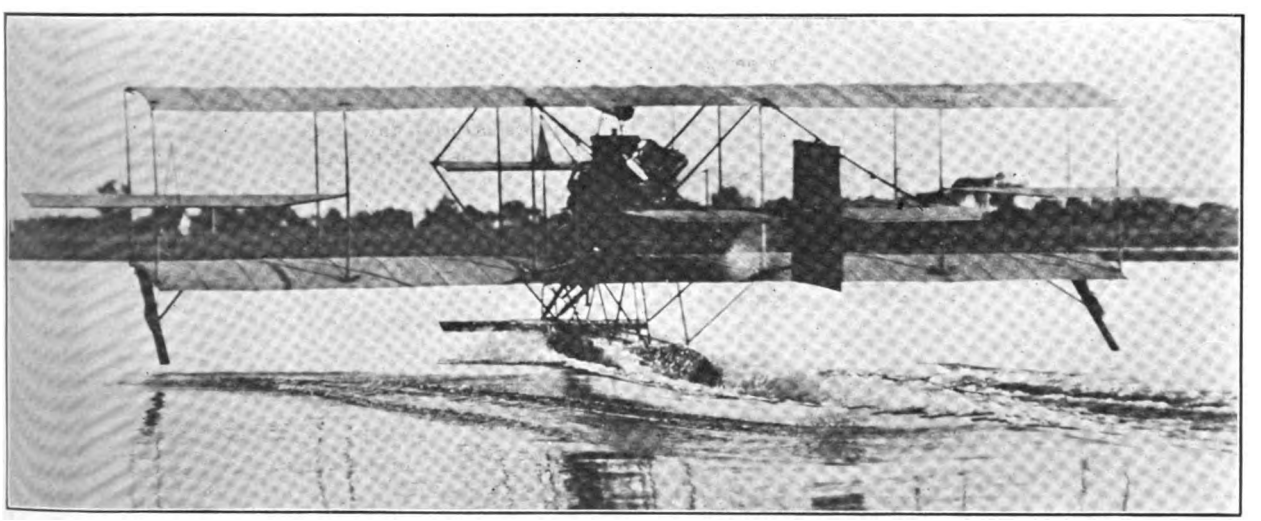
The Sociedad Sportiva Argentina has made an offer to the Argentine minister of war, looking toward a popular subscription for an aerial fleet to be presented to the navy. Several prominent men are at the head of the movement, and apparently the fund will be raised in a short time.

The appellate division of the supreme court in New York has dismissed the suit of the Wright Company against the Aero Corporation, Ltd., in which it sought to recover $15,000 for the use of Wright biplanes during the international meet at Belmont Park, Long Island, in 1910. The Aero Corporation was organized for the purpose of conducting this meet, and it was claimed by the plaintiff that it was to receive a total of $25,000 for the use of its machines providing the net receipts and subscriptions should aggregate $125,000. It admitted having received $10,000. The defendant claimed that the receipts did not reach the amount specified and that there was not sufficient funds to repay the loans to subscribers.

Complete details concerning the recent aerial Grand Prix, under the auspices of the Aero Club de France, in which Roland G. Garros in a Bleriot monoplane was the only aviator to finish, have reached this country. The course was from Angers to Cholet, Saumur and return, a distance of 97.7 miles, which was covered seven times in the two days. Seven aviators started and but four finished the first round.

Garros, who drove a Gnome engined Bleriot monoplane, Bosch equipped, of course, not only won the grand prize of $10,000, but a special prize of $4000 and the fourth "consolation" prize of $1000, or approximately $15,000 for the two days. The official time for the various rounds follows:

Grand Prix—Garros, Bleriot, first, 2:39:38; second, 2:57:18; third, 2:20:02; fourth, 1:48:52; fifth,



Digitized by Google

1:48:13; sixth, 2:20:15; seventh, 1:51:06. Brindejonc, Morane, first, 4:08:07; second, 3:16:35; third, 1:49:00. Espanet, Nieuport, first, 2:06:48. Hamel, Bleriot, first, 2:23:53.

Consolation, three rounds—Espanet, Nieuport, 1:04:56; Bobba, Morane, 4:21:41; Brindejonc, Morane, 4:32:20; Garros, Bleriot, 5:53:41; Gaubert, Astra, 6:40:53.

The French Navy has decided to investigate the merits of the Curtiss hydraeroplane. Flying from Juan-les-Pins to Frejus, Louis Paulhan, the European representative of the Curtiss Aeroplane Company, recently encircled the ships of the fleet and alighted alongside of the Foudre. Subsequently the machine was hoisted on board for the night.

An accompanying illustration shows one of these machines getting up speed before leaving the water. This hydraeroplane has been flown by Hugh A. Robinson in several meets in this country. It was scheduled to appear at the recent Boston meet, but was withdrawn at the last moment, because of the refusal of the Aero Club of America to sanction the events.

Type of Curtiss Hydraeroplane Recently Tried Out Before French Navy, Getting Up Speed Before Leaving the Water.

Experimenting with over-sea flights, the Zeppelin dirigible Victoria Luise, left Hamburg, Germany, June 27, for a 10-hour flight over the North sea, carrying 12 passengers. The successful outcome of the test has caused unusual press comment in England on the ground that it has been demonstrated that an aerial invasion of the British Isles is decidedly possible. The Victoria Luise maintained an average speed of 45 miles.

A dispatch from Vienna, Austria, states that Aviator Czakay carried a passenger to an altitude of 13,779 feet near that city June 28. The best previous record for altitude with a passenger was held at 9840 feet by Prevost of France. The world's record for altitude with aviator alone is 13,943 feet, held by Roland G. Garros of France. No mention is made of the machine flown by Czakay.

Capital closely associated with the Aero Club of America has acquired a plot of ground at Hempstead Plains, Long Island, on which will be constructed an ideal flying field for future meets in the vicinity of New York City. The Long Island motor parkway runs along one side of the field, and it is within easy access of the Long Island Railway. The Hempstead Plains Aviation Company has been organized to take over the project, the officers being as follows: President, Allen W. Evarts; vice president, Gage E. Tarbell; secretary and treasurer, G. L. Hubbell; general manager, Douglas S. Houghton.

Robert G. Fowler, who made a transcontinental flight from Los Angeles to Jacksonville, Fla., in December and January, and J. C. Mars, who has been flying for the past two years as a member of the Curtiss team, have organized the Fowler-Mars Company, with capital of $75,000, for the manufacture of aeroplanes. The new concern expects to locate in Leavenworth, Kan. No announcement has been made relative to the type of machine which will be made, although Fowler flew a Wright biplane and Mars a Curtiss.

Accompanying Harry Brown in a biplane, Rodman Law made a parachute jump from an altitude of 3000 feet near New York City, June 25. This is one of the few successful jumps of this character made in the history of heavier-than-air flying. It is expected to prove of decided value to the future of aviation. The jump was made without incident, the parachute opening after a drop of some 100 feet. The wind carried Law practically a mile before he reached the earth, unharmed.

Digitized by Google

While scheduled as the third annual Boston aviation meet, the programme which opened June 29 at Squantum, Mass., was under different management than the previous events, and was without the sanction of the Aero Club of America. Application was made to this organization several weeks ago, and it was not until just before the opening day that decision was reached. The action was determined upon on the ground that the prizes were not posted in the proper manner. This did not deter 13 aviators from signing for the various events, although some of the better known men withdrew their entries. It is understood that those competing were notified that they would be disqualified if they took part.

Those who appeared during the opening day were: Lincoln Beachey, Curtiss; Charles K. Hamilton, Curtiss; Phillips Ward Page, Burgess-Wright; George Gray, Burgess-Wright; Miss Harriet Quimby, Bleriot;

Miss Harriet Quimby Beside Her New 70 Horsepower Bleriot Military Monoplane.

Miss Blanche Scott, Martin; Glenn L. Martin, Martin; Arch Freeman, Burgess-Wright; Farnum Fish, Burgess-Wright; Charles Niles, Thomas; George Catmore, Burgess-Wright; Frank Tirrell, Curtiss, and Paul Peck, Columbia.

Among those who were expected to take part, but who failed to appear after the sanction of the Aero Club of America was denied, were: Lieut. T. D. Milling, Burgess-Wright; Robert G. Fowler, Wright; Frank Coffyn, Wright hydraeroplane; Hugh Robinson, Curtiss hydraeroplane, and George W. Beatty, Wright.

Miss Harriet Quimby, America's first and foremost woman aviator, and William A. P. Willard, manager of the Boston meet, who was flying with her, were thrown from her 70 horsepower Bleriot military monoplane at Squantum, Mass., upon their return from a flight to the Boston light, and instantly killed, July 1. The fatality, which was the first in New England, had a depressing effect upon the other aviators taking part in the meet, but the programme was continued as originally outlined.

The death of Miss Quimby is a serious loss to the cause of aviation in America, particularly as she had given much promise as a pilot of exceptional ability. Both here and abroad, whence she had but recently returned after being the first woman to fly her own machine across the English channel, she was recognized as possessing an intimate knowledge of her machine. She had few equals and no superiors among the members of her sex.

Prominent aviators who were present at Squantum when the accident took place disagree as to the cause. Apparently, a gust of wind caught the monoplane as Miss Quimby was about to descend. Whether the controls became ineffective in some manner, or for some other reason, the tail was seen to rise suddenly, and the passenger was thrown from the rear seat, which in the new Bleriot craft is located well toward the rear. An instant later, Miss Quimby also was thrown from her seat and the monoplane landed in the water on its back.

It was the first machine of this type flown in America and Miss Quimby had driven it but four or five times before the accident. She was accustomed to handling a Bleriot, but of an older type and fitted with a 50 horsepower motor.

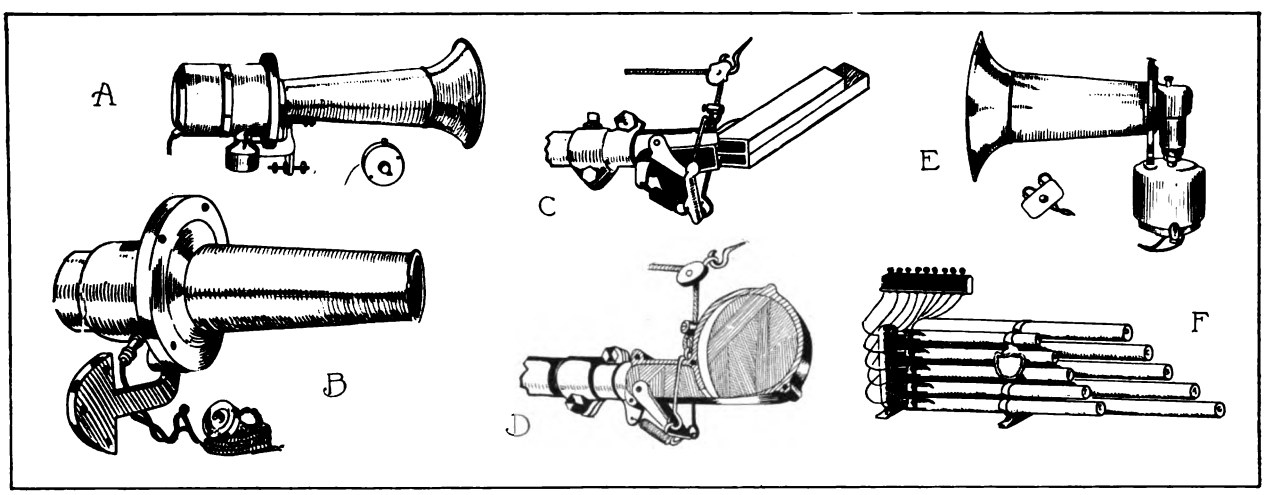
Robert J. Collier, president of the Aero Club of America, has completed his course of instruction in the handling of a hydraeroplane under the guidance of Walter Brookins and recently made his first flight unattended in a Wright biplane, equipped with double pontoon attachment. He will take his test for a pilot's license in the near future.

Jules Vedrines of France, who was seriously injured in a flight earlier in the year, has again taken up his work as an aviator pilot. With his head swathed in bandages he recently flew for half an hour in a new 150 horsepower Deperdussin monoplane at Etampes.

The Swedish army has purchased a Breguet military biplane, made in France. This machine is equipped with an 80 horsepower, seven-cylinder Salmson-Canton-Unne motor, and in its official tests made 66.4 miles an hour.

Although the Italian government has offered a substantial prize for the construction of a satisfactory aeroplane of Italian manufacture, it is interesting to note that the army of that country has purchased a Maurice Farman biplane, made in France.

Those responsible for the 1912 aerial craft salon in the Grand Palais, Paris, have decided upon Oct. 26-Nov. 10 as the dates. This is practically two months earier than the salon of 1911.



Digitized by Google

ACCESSORIES OF VALUE IN TOURING.

Practical Devices Which Facilitate the Maintenance and Operation of the Car or Contribute to the Comfort and Convenience of the Passengers.

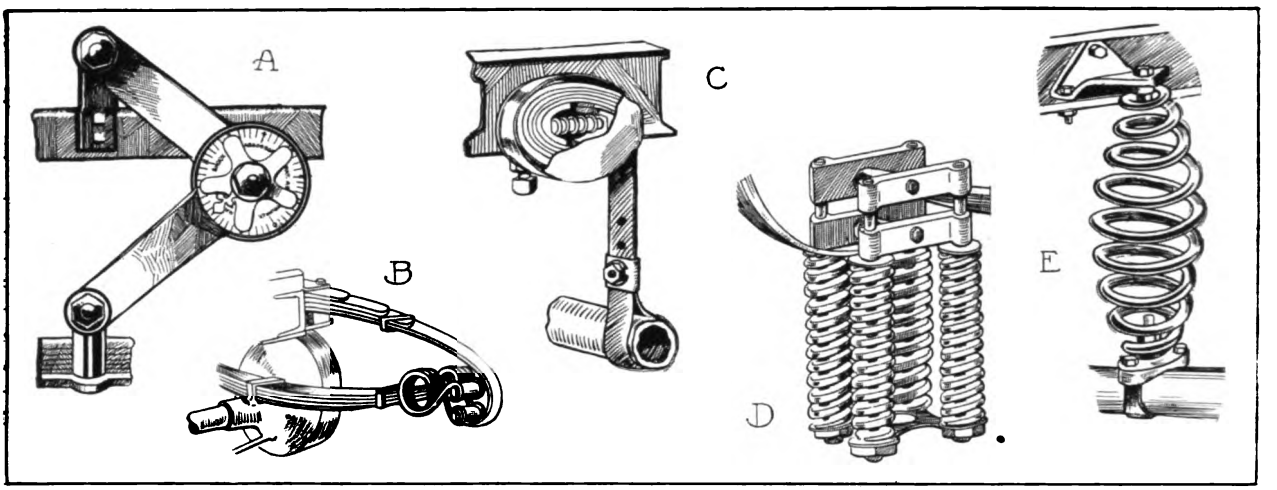
ACCESSORY manufacturers have made rapid progress in the development of devices which contribute to comfort and convenience, as well as facilitate the operation and maintenance of the car at all times. Much necessary work which formerly meant strenuous exertion is now performed by mechanical and other means, these requiring but little effort on the part of the user in their application. By the utilization of these practical and useful members the motorist is able to undertake successfully tours through sections where the services of the public garage, for instance, are not obtained easily.

Although the standard equipment of the modern car may include top, windshield, speedometer, horn, lights, gas tank and tools, it may be augmented by the addition of other accessories which are described and illustrated herein, and from which the motorist may make his selection according to his requirements and individual taste. Obviously, it would be impossible to give a full list of such devices in an article of this character, but those selected for description will be found to include standard productions of representative concerns, and it may be extended by the addition of similar supplies found listed in the Classified Buyers' Guide elsewhere in this issue.

Signalling Devices Operated by Electricity or the Exhaust Are Favored Because of Their Volume of Sound: A, B and E, Tuto, Newtone and Klaxon Electric; C, D and F, Jubilee, Jericho and Gabriel Exhaust.

SIGNALLING DEVICES.

Although the bulb horn is recognized as standard for a signalling device there is a growing tendency among motorists, especially those who drive considerably in the country, to fit a signal actuated by the exhaust of the motor or by electricity. The advantages of these horns are manifold, as by them a warning note ranging from mellow tone to a penetrating sound may be produced easily, by depressing a pedal or pushing a button. The fact that they may be operated without removing the hands from the steering wheel appeals to many motorists especially when traversing rough and unfamiliar highways and when the latter wind in and out, often hiding an approaching machine from view.



Gabriel.

The Gabriel Horn Manufacturing Company, Cleveland, O., is marketing a new 10-tone Gabriel musical horn which will appeal to motorists who desire a signalling device capable of producing a wide range of notes operated together or independently of one another. The member may be utilized on a 30 horsepower car as well as one equipped with a larger motor and by it a variety of chords is possible. The company also manufactures musical signals of one or more notes, all operated by the exhaust.

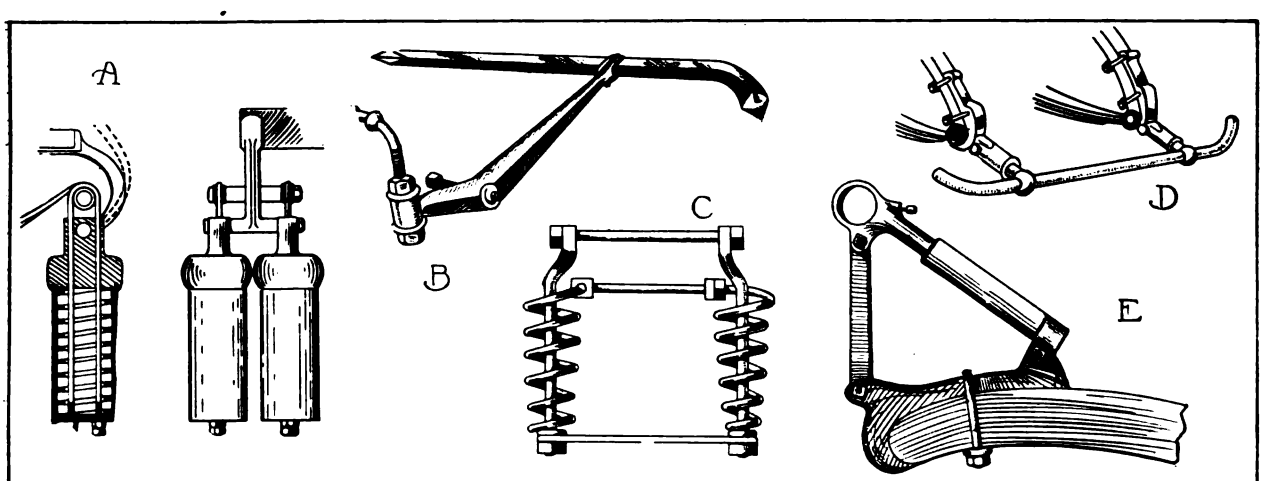
Jericho and Jubilee.

A signalling device operated by the exhaust of the motor and which is installed in the rear of the muffler, either by clamping over the muffler stem by a double clamp coupling, or by screwing into the muffler by a threaded coupling, is the Jericho, marketed by the Randall-Faichney Company, Boston. A simple pressure of a pedal gives a pleasing tone, clear and distinct, at any speed without racing the motor. The note may be mellow or far reaching as desired. The company also produces the Jubilee horn, which is operated in the same manner as the Jericho, the device giving forth notes similar to a set of chimes.

Digitized by Google

Shock Absorbers Eliminate the Possibility of Broken Springs and Contribute to the Comfort of the Passengers: A, Truffault-Hartford; B, Acme; C, Gabriel; D, Velvet; E, Sager.

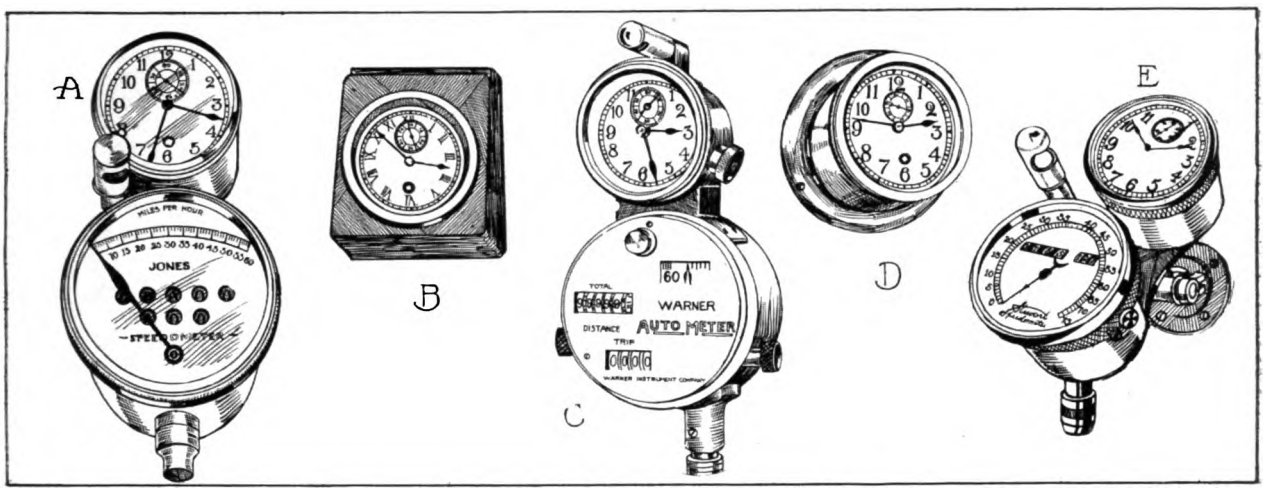
Newtone.



The Automobile Supply Company, Brooklyn, N. Y., is featuring the Newtone torpedo type electric horn, and one of the many features emphasized of it is that it is very economical in current. The motor comprises a field of 75 laminated pieces and the diaphragm is of steel, .03125 inch thick and it is pointed out that this design not only makes for durability and efficiency, but a set of batteries will endure a season. It is operated by a push button switch which may be located as desired and the design adds to the attractiveness of the car. The same quality of construction is maintained in other members of the line.

Tuto.

The design of the Tuto electric horn, manufactured by the Dean Electric Company, Elyria, O., is such that a light pressure of the switch causes a slight contact of the armature on the diaphragm, producing a mellow tone, while further depressing the button increases the amount of current and augments the volume of sound. This range of notes is possible by the special switch make by the company which may be located on the steering wheel or spokes, enabling the operation of the signal without removing the hand from the wheel. In addition, the company makes the Tutoette, a smaller replica of the Tuto, and a new horn known as the Tally-O-Horn. The latter is concealed under the hood, operated easily by a bulb conveniently located near the driver, and produces a low, rich tone.



SHOCK ABSORBERS.

The fitting of shock absorbers or some supplementary means of taking up the jars and stresses resulting from the uneven road surface, not only eliminates vibration, but protects the occupants of the machine and its mechanism as well. In addition to comfort and safety, the utilization of shock absorbers diminishes tire bills, an important factor in touring.

Shock Absorbers and Bumpers: A and C, J. M. and Supplementary Spiral; B, D and E, Sager, Western and E-Z Bumpers.

Digitized by Google

Speedometers and Clocks Are Valuable Adjuncts to the Equipment: A, C and E, Jones, Warner and Stewart Speedometers; B and D, Chelsea and Boston Clocks.

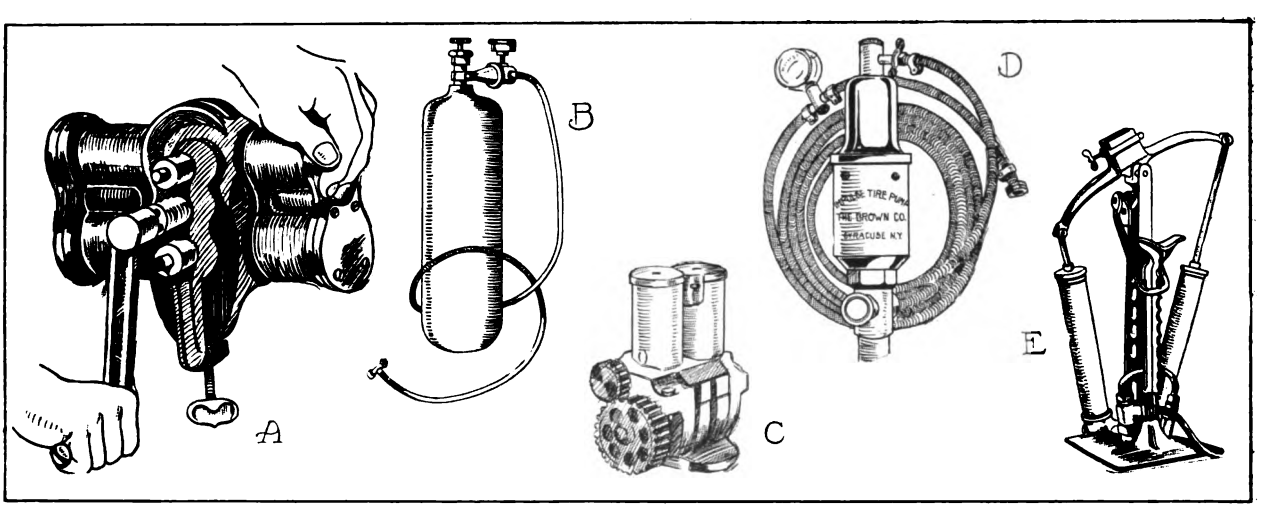
Acme Torsion Springs.

The Acme torsion springs, manufactured by the Acme Torsion Spring Company, Boston, as their name implies, are designed to eliminate vibration and to absorb road stresses. They are in the form of a double coil, one on either side of the springs, and extensions permit of easy and quick attachment to the latter.

Gabriel Rebound Snubber.

The principle of the Gabriel rebound snubber, made by the Gabriel Horn Manufacturing Company, Cleveland, O., is that of checking the recoil of the springs by means of the friction of a belt wound about a device that is expanded by a spring. The circular case containing the belt is attached to the frame of the car and the other end of the belt to the axle. As the spring is compressed the belt is automatically wound up, the recoil being restrained by the friction and the resistance by compression.

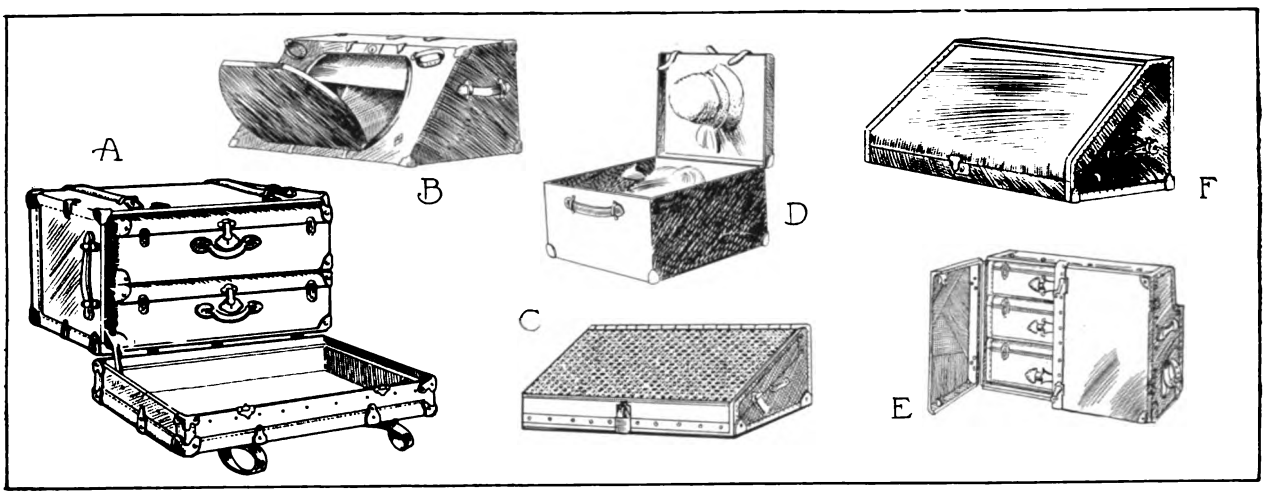
J. M.



The J. M. shock absorbing device, manufactured by the J. M. Shock Absorber Company, Philadelphia, comprises two coiled springs enclosed in barrels adapted for fitting to the rear or forward springs of the machine. The coiled springs hold those of the vehicle normally and when subjected to road shock the compression of the coil members in their containers nullifies the stresses. Special fittings are provided for attachment.

Sager Springs.

The Sager shock absorbing springs are wound oval instead of round, it being held by the manufacturer, the J. H. Sager Company, Rochester, N. Y., that the design makes for better resistance to the road shocks. The springs are fitted by hangers to the chassis frame and clamp to the axle. As the springs are normally set they resist compression or recoil of the car springs proportionate to the degree of movement. They are made in differing sizes and forms.



Supplementary Spiral Springs.

The Supplementary Spiral Springs, marketed by F.

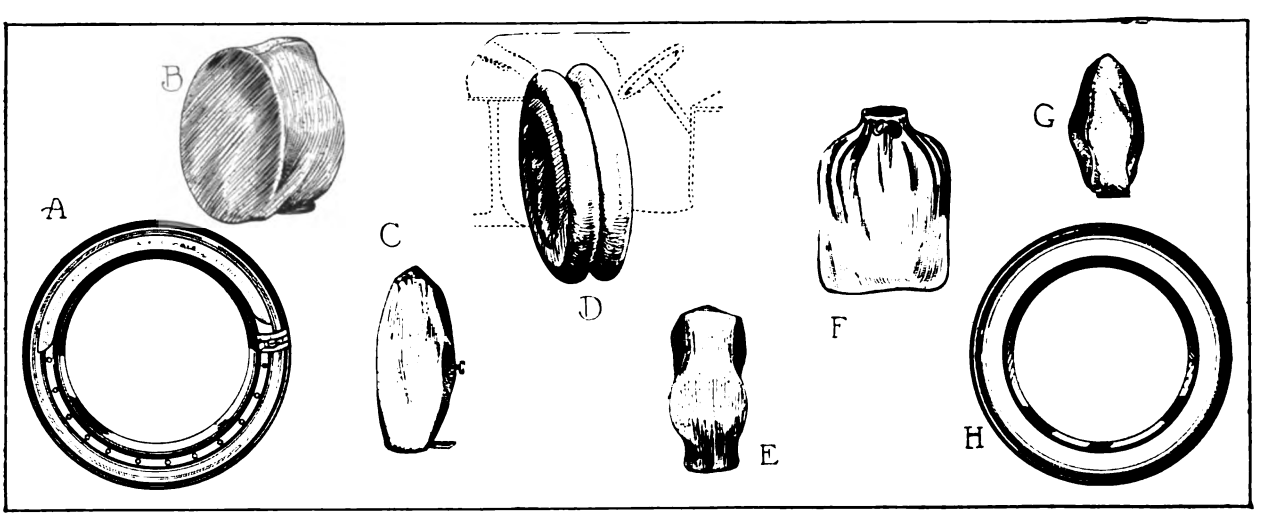
The Inflating of Tires Is Made Easy by Power Pumps, Air Bottles, Etc.: A, Hawthorne: B, Goodyear Tire Bottle; C, Crown; D, Brown; E, Warner-Service.

Digitized by Google

Trunks Are Made in Shapes and Sizes to Meet Individual Requirements: A, Auto-Rest; B, Kamlee; C and E, Ajax; D and F, Berg.

Shirley Boyd, Boston, are designed to eliminate broken springs as well as lateral and vertical motion of the car. Comprising a pair of spiral members for each spring, varying compressional and recoil stresses are absorbed, taking up every shock and allowing the car to regain normal position without jarring the passengers. They are applicable to both front and rear springs and are made in five models.

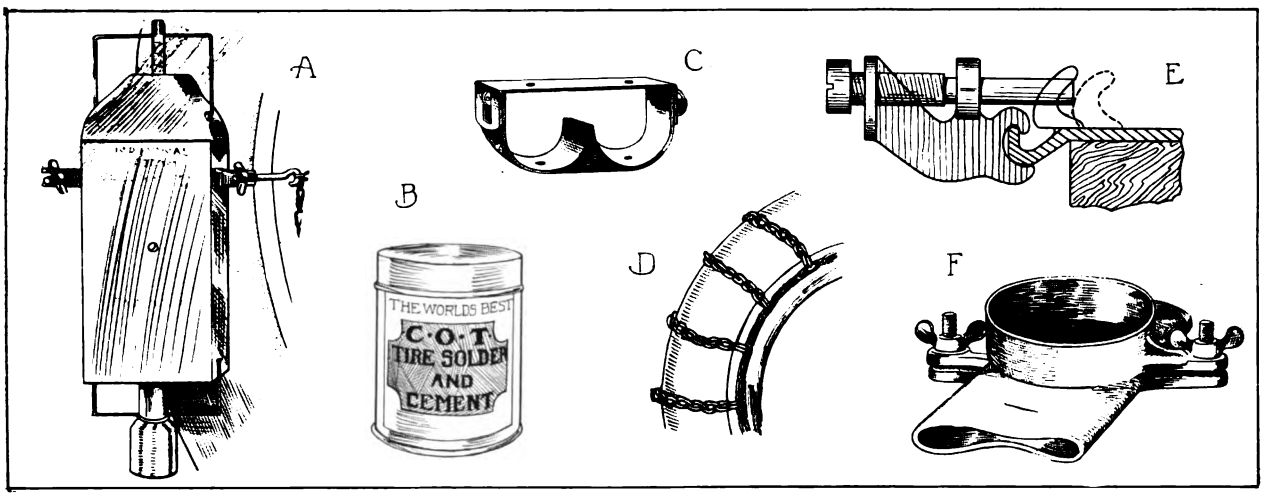
Truffault-Hartford.



The Truffault-Hartford shock absorbers, made in four sizes by the Hartford Suspension Company, Jersey City, N. J., comprise a double arm with a circular recess containing frictional discs and a single arm between the recesses, the parts being retained by a bolt and adjustment nut. The device may be adjusted to compensate for any excessive spring action and being enclosed is impervious to the action of dirt, moisture and foreign elements.

Velvet Auxiliary Springs.

The J. W. Blackledge Manufacturing Company, Chicago, maker of the Velvet auxiliary springs, have a shock absorber comprising four helical springs mounted on four rods fixed in the base, at the top of which are two fittings, the upper attached to the lower spring half and the lower to the upper spring half. The lower fitting moves vertically on the rods with the compression or recoil of the vehicle spring. They are made in five sizes and for different type springs.



BUMPERS.

Bumpers not only protect the radiator and lamps from injury through careless operation of other cars when on the road, but the device protects the automobile in the garage where shifting the car is attended with more or less risk by those unfamiliar with its operation. Sometimes a machine is likely

Tire and Lamp Covers Exclude Foreign Elements: A, D and H, Gilbert, Amphi and Hopewell Tire Covers; B, C, E and G, Hopewell Lamp Covers; F, Gilbert Inner Tube Bag.

Digitized by Google

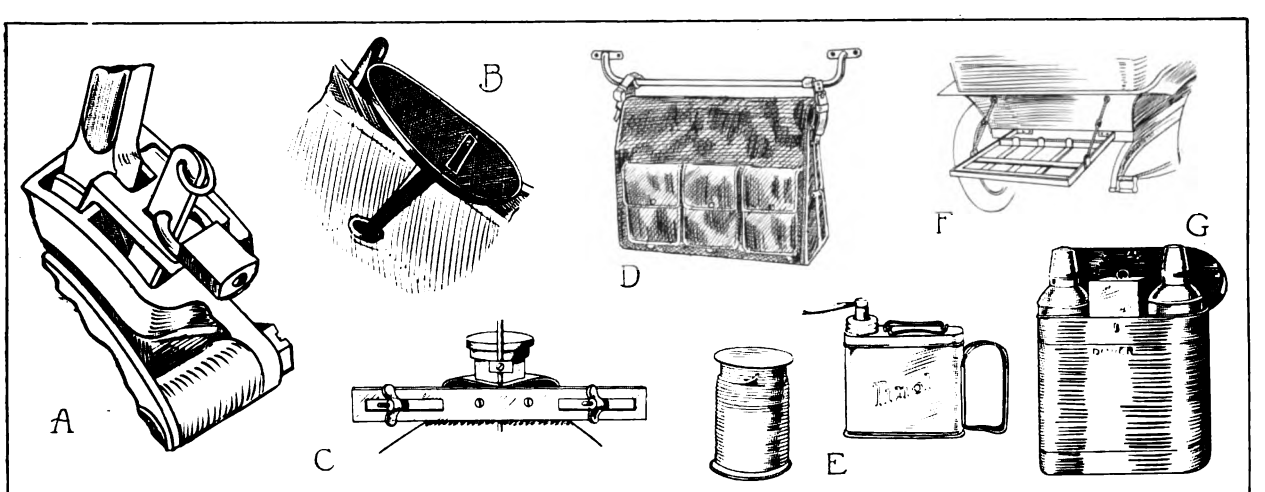
Some Practical Tire Devices: A, National Vulcanizer; B, C. O. T. Tire Solder and Cement; C, Nathan Tire Lock; D, Weed Tire Chains; E, Tobey Q. D. Rim Remover; F, Adamson Vulcanizer.

to be backed into another, creating considerable damage.

The J. H. Sager Company, Rochester, N. Y., manufactures several types of bumpers and its Diamond bumper will appeal to the most discriminating motorist, as the diamond shaped bar is made of heavy, solid, hardened brass, reinforced with thick, open-hearth steel. The bell cranks are of solid manganese bronze and the device adds to the appearance of the machine.

A different type of bumper is the E-Z Angle, marketed by the Cox Brass Manufacturing Company, Albany, N. Y. The cross bar is carried up higher than those of usual construction and the device is secured to the car by a special clamp.

SPEEDOMETERS AND CLOCKS.



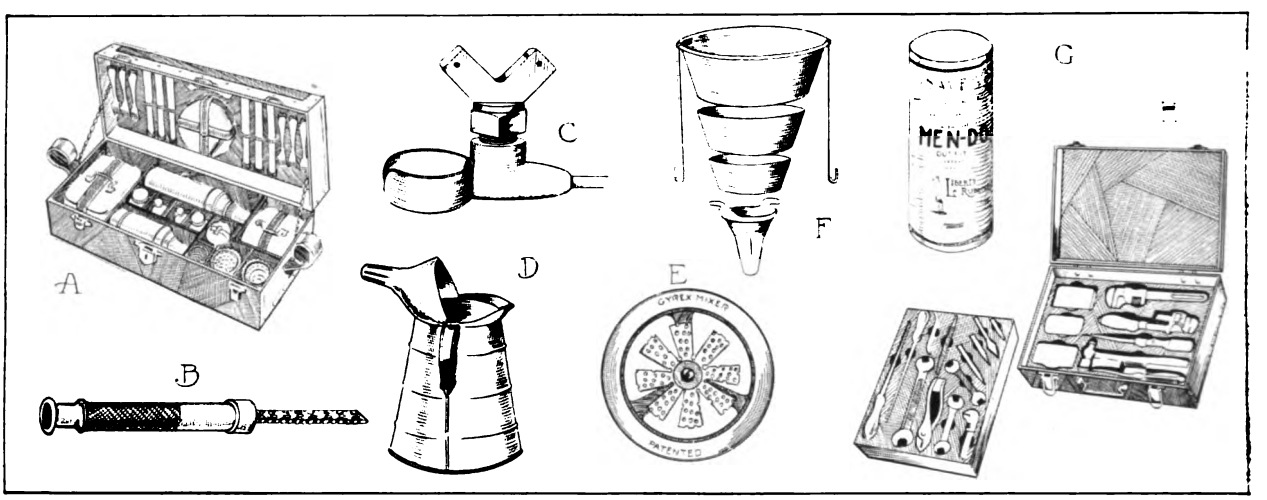
In touring through sections where the laws regulating the speed of the motor car are rigidly enforced, the speedometer will be found to be one of the most essential accessories of the equipment. These instruments have attained a high degree of perfection, and are made in different types and in combination with clocks, and electric lights for illuminating both indicator dials.

Jones.

The Jones Speedometer Company, New Rochelle, N. Y., produces a variety of standard models and of different finish. One combination instrument registers speed up to 60 miles an hour and includes season and trip mileage recorders. It is constructed on the principle of centrifugal force and finished in either nickel or black enamel. The instrument includes a high grade eight-day clock and the dial of this member, as well as that of the speed recorder, is illuminated at night by an electric light.

Stewart.

Various models including those in combination with clocks and electric lighting, are produced by the



Miscellaneous Accessories: A, Fetter Lock; B, Sidwell Pedal Mat; C, Leyman License Bracket; D, Ajax Combination Coat Rail and Bag; E, Tinol Outfit; F, Connecticut Trunk Rack; G, Dover Thermos Case.

Digitized by Google

Stewart & Clark Manufacturing Company, Chicago, maker of the Stewart instruments. The principle of operation is magnetic force. A feature of some models is the provision made for regulation by micrometer. The trip register may be set at any time to .1 mile. Model 29 is equipped with a 100,000-mile season odometer, 100-mile trip register and an eight-day Seth Thomas clock. The speed dial registers to 75 miles an hour.

Warner.

The Warner line of auto-meters, produced by the Warner Instrument Company, Beloit, Wis., are magnetic instruments and model M 2 includes a high grade eight-day clock which is lighted at night by an electric bulb as is the speed indicating scale. The odometer registers up to 100,000 miles before it automatically resets and the trip member up to 1000 miles. Another reset turns up any desired mileage on the trip odometer, facilitating the utilization of route books when touring, also permitting deviations to be made.

Miscellaneous Accessories: A, Ajax Luncheon Outfit; B, Twitchell Tire Gauge; C, Ferguson Gas Burner; D, Dover Combination Measure and Funnel; E, Gyrex Mixer; F, Best Funnel; G, Men-Do; H, Bergrade Tool Case.

Boston Clocks.

A line of high grade eight-day automobile clocks is marketed by the Boston Clock Company, Boston, and these have seven-jeweled escapements, cut steel pinions, compensation balances and dust and waterproof cases. They are constructed of high grade material, beautifully finished and guaranteed not to be affected by rough roads. They are equipped with a theft proof method of attachment. Outside stem winding and setting clocks are listed as extra.

Chelsea Clocks.

The standard equipment of many cars does not include a clock and the fitting of one of these members to the dash enables the driver and passengers to note the time without necessitating the use of the watch. The Chelsea Clock Company, Boston, manufactures a variety of high grade instruments for attachment to the dash or interior of the body. The retaining screws are concealed and means are incorporated to prevent theft. The numerals are read easily and the clocks are impervious to road shocks, and are accurate timekeepers.

TIRE PUMPS, BOTTLES, ETC.

Punctures are inevitable and pumping up a large sized tire by hand on a hot day is a disagreeable task. These labors may be avoided by adding to the equipment a pump actuated by the energy of the motor, by the utilization of a tire bottle containing compressed air, or a mechanical device requiring but little effort in service.

Brown Impulse.

The Brown Impulse tire pump, manufactured by the Brown Company, Syracuse, N. Y., is a compact device which is screwed into the spark plug opening, and although utilizing the compression of the cylinder it draws in fresh, pure air through a specially designed valve. The device is equipped with a pressure gauge for preventing improper inflation and a length of tubing suitable to reach each tire on the car.

Crown.

The Crown tire pump produced by the Clarke Pump Company, West Newton, Mass., is gear driven from any convenient place on the power plant of the car. The bore and stroke of the two cylinders are large, providing a pressure capable of inflating a large sized shoe in a very short time. It is provided with means for operation as desired and when not in service does not utilize any energy of the motor.

Goodyear Tire Bottle.

The Goodyear air bottle, produced by the Goodyear Tire & Rubber Company, Akron, O., will appeal to motorists as by it a tire may be inflated quickly without any other effort than turning a valve. It is equipped with a gauge for noting the pressure of the air in the tube, and each bottle will inflate from six to 30 tires, according to their size. The bottles are exchangeable at any of the company's numerous service stations.

Digitized by Google

Hawthorne.

The Hawthorne four-cylinder pump, made by Hawthorne Manufacturing Company, Bridgeport, Conn., is designed for attachment to the running board or other convenient place and the turning of a handle actuates four pistons which create a positive source of pressure with little manual labor. The device is compact, may be carried easily in the tool box, and includes a suitable length of tubing.

Warner-Service.

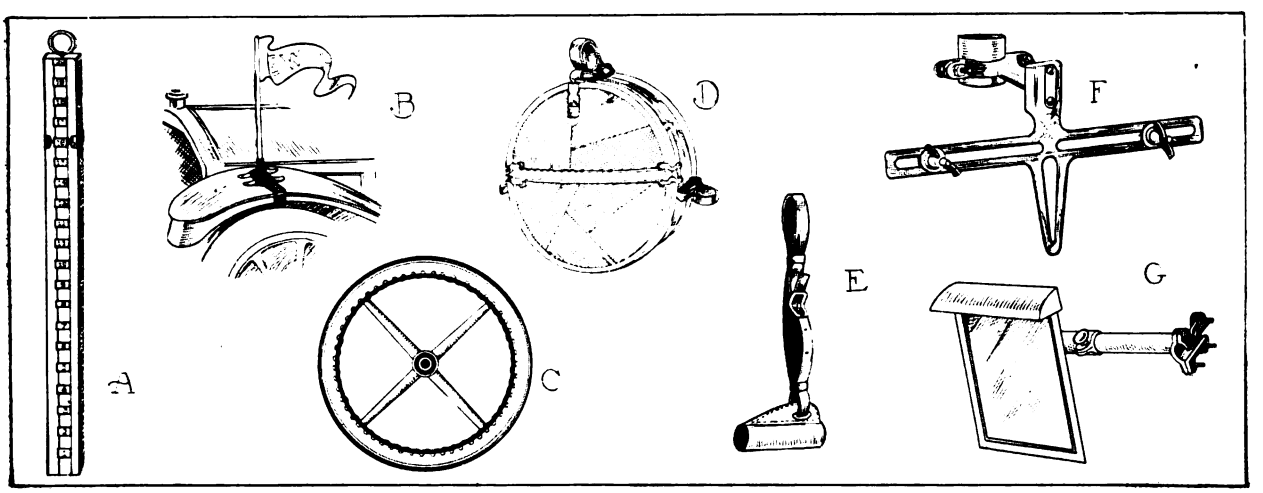
A combination jack and pump is the Warner-Service jackpump, made by the Warner-Service Manufacturing Company, Jersey City, N. J. By it the car may be lifted easily and connected with the jack are two high pressure compound pumps, actuated by hand.

TIRE AND LAMP COVERS.

Tires and lamps should be covered when not in service, as the air, sunlight and moisture affect the former while the metal of the lamps becomes tarnished and the burners clogged with dust through exposure to the elements. Tire covers not only preserve the shoes but add to the appearance of the machine.

Hopewell.

The tire cover manufactured by Hopewell Bros., Newton, Mass., will appeal to motorists as it is attached easily and protects the casing fully. The tread overlaps, giving protection where most needed and the design is also adaptable to shoes fitted to demountable rims. In addition the company makes a large line of lamp covers, these including side, tail, limousine and headlight, utilizing oil, acetylene and electricity. The covers are substantially constructed of high grade material and are equipped with a special fastener.



Tire Trunks.

Although many motorists carry inner tubes in casings under the seats, when their use is desired the passengers are inconvenienced. By fitting a tire trunk to the running board, the tubes are more accessible and as the trunks are equipped with locks loss of the tubes is prevented. Space is also provided for the storage of other articles, which are protected from the weather as the trunks are moisture and dust proof.

OTHER PRACTICAL ACCESSORIES.

There are numerous practical devices which may be included under the head of tire equipment and among these may be mentioned a vulcanizer for repairing damaged casings, also for mending punctured inner tubes. These accessories are so constructed that they may be operated easily by those unfamiliar with tire repairing and work may be performed upon the road, if desired.

In addition to the above is C. O. T. solder and cement manufactured by Charles O. Tingley & Co., Rahway, N. J., an equipment which is guaranteed to repair cuts in shoes or punctures in tubes without heat or vulcanization. Being compact the outfit occupies but little room in the car.

Miscellaneous Accessories: A, Goodnow Gasoline Gauge; B, Universal Pennant Holder; C, Nathan Wheel Cover; D, Berg Tire Trunk; E, Gilbert Crank Handle Holder; F, Neverout License Bracket; G, Empire Mirror.

Another preparation for mending tires and tubes is Men-Do, manufactured by the Liberty Rubber Company of Orange, N. J. It comes in a neat, compact can, and casings and tubes may be repaired easily and quickly without heat or tools, the material being applied with the hands.

It frequently happens that the tire rims will become rusted, making their removal a difficult matter. A simple and inexpensive tool for this work, and which will start the most obstinate rim is the Tobey rim remover manufactured by William L. Tobey, Boston. It is operated by a screw driver and is very compact, and may be carried in the vest pocket if desired.

The equipment of the car is not complete without a set of Weed tire chains as those members not only prevent skidding thereby avoiding accidents but provide traction on muddy roads and slippery pavements.

Digitized by Google

They are made by the Weed Chain Tire Grip Company of New York City.

Trunks.

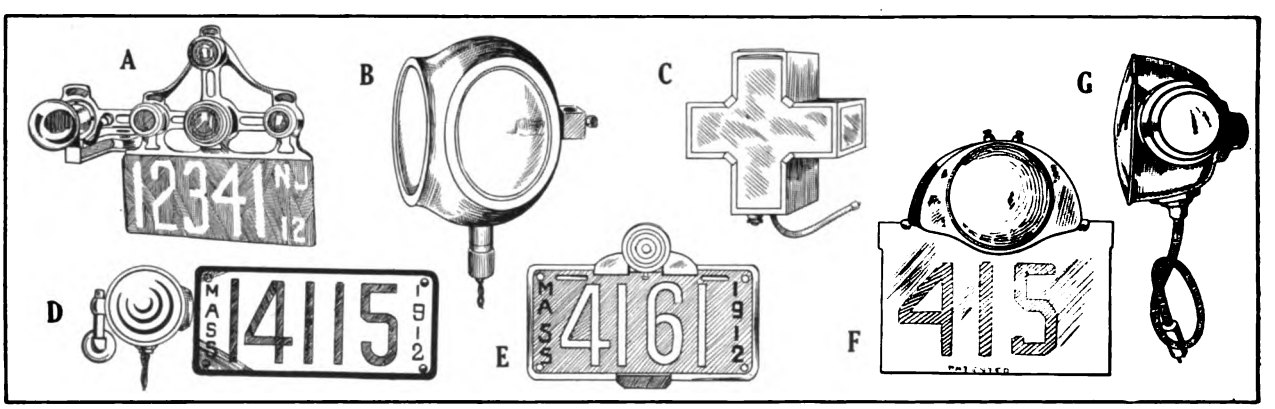
As the passengers of the automobile will require a change of raiment at the completion of the day's trip, and as there are more or less extra wraps to be carried, it is important that these members be protected from the dust and rain. Manufacturers of trunks have specialized in those adapted for motoring, and a wide variety of styles and designs is obtainable, among which may be mentioned those for storing dress suit cases, clothes, hats, etc. Some are constructed to be utilized as a foot rest in the tonneau while others are to be secured to the trunk rack, the type depending upon the design of the car and individual requirements of the occupants.

A trunk rack will be of service on the tour and a very durable member is manufactured by the Connecticut Steel & Wire Company, Hartford, Conn., which possesses among other advantages that of being folded up when not in use. Coat and robe rails occupy but little room and an auxiliary attachment is the coat rail bag in which may be stored to advantage many articles, and the device is also provided with convenient individual pockets.

Luncheon Outfits.

Another accessory that will appeal to the tourist is the luncheon outfit which is equipped for six persons and includes knives, forks, plates, cups, food boxes, Thermos bottles, etc. These outfits are manufactured in different styles including one in the form of a tire trunk which is fitted with folding legs inside the cover, which serves as a table.

A neat and compact outfit is the Dover steel Thermos case, made by the Dover Stamping & Manufacturing Company, Cambridge, Mass., as provision is made for the carrying of two Thermos bottles and a sandwich case. The utility of the vacuum bottles is well known and appreciated by motorists as they maintain fluid in a hot or cold condition as desired. The Dover case is constructed of steel and its interior is fitted with a heavy lining which forms an absolute protection against shocks. The cases are enamelled black, are inexpensive, and occupy but little room.



License Brackets and Pennant Holders.

In some states the laws require the license tag to be so attached that it will not swing and while the rear number may be secured easily, suspending the front member is more difficult. There are several forms of license brackets designed for attachment to the filler member of the radiator and some of the devices include a pennant holder.

There is a growing tendency to collect and attach pennants to the car as it tours through different cities and states, and among the equipment for this purpose is a clamp member permitting of fitting to the fender or other convenient place.

Another useful device is the driver's mirror which is secured to the windshield or dash, enabling the operator to discern an approaching vehicle from the rear, as well as preventing accidents in traffic.

In touring the motorist cannot be too careful in maintaining the supply of fuel and to eliminate guess work the car should be provided with a measuring device. The Goodnow Manufacturing Company, Boston, produces the Goodnow gasoline gauge which is practical and inexpensive and which is handsomely finished in black stained wood and with 20 brass markers. These and an outside lever marker register the amount of the fluid at any given time.

Electric Rear Lights and Signalling Devices: A, Neverout; B, Electric Star; C, Fowler; D, Gray & Davis; E, Couch & Seeley; F, Holt & Beebee; G, Guide.

Among other accessories may be mentioned a cover for the steering wheel, its function being to eliminate vibration as well as facilitating the control of the machine. They are made in different materials and are applied easily. A leather support for the starting crank handle not only prevents wear by swinging but keeps the crank from coming in contact with road obstructions.

In operating over rough roads the foot is likely to slip off the clutch pedal and endeavoring to "ride" the pedal is tiresome. This is overcome in the Sidwell pedal mat, manufactured by the Sidwell Pedal Mat Company, Boston, as the device is fitted with a toe stop in addition to the non-slipping material.

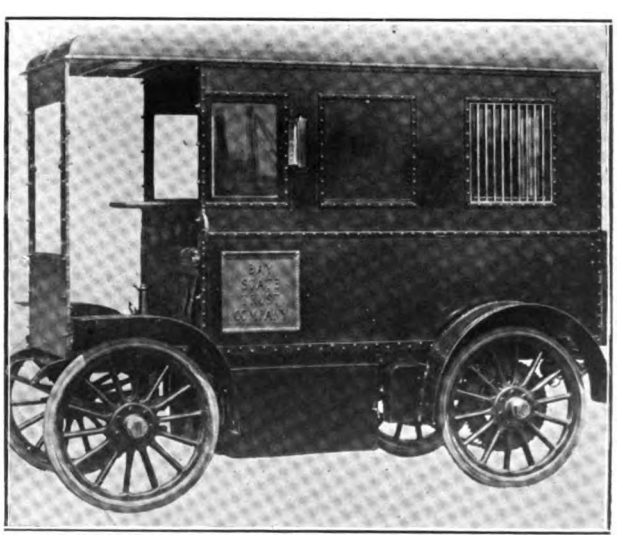
IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

INTERESTING BANK WAGON.

The uses to which industrial transports are put are so many and so varied that it excites very little comment when a new line is added. This is particularly true in America, while abroad commercial vehicles have by no means gained the supremacy that might be expected. Recently, Great Britain was decidedly interested in its first motor driven bank wagon. Many of the banking houses in the larger cities in this country have enjoyed the greater security thus afforded for some months.

Herewith is presented the G. V. electric bank wagon in service with the Bay State Trust Company, Boston, the chassis being a 1000-pound delivery wagon, made by the General Vehicle Company, Long Island City, N. Y., while the body is of special design. It will be noted that every effort has been made to present a vehicle that will afford the most protection to money and securities, transferred from place to place.



Since the adoption of this car, the bank in question has added materially to its business through a service which includes the delivery of pay rolls and the collection of deposits. Under the old plan each business house was compelled to maintain its own wagon and corps of employees to protect its pay roll while being taken through the city streets. Under the new regime the bank assumes the responsibility of loss during delivery. The collection of deposits also is an important matter as it provides means for stores and other concerns to make late deposits without danger of loss by carelessness or theft.

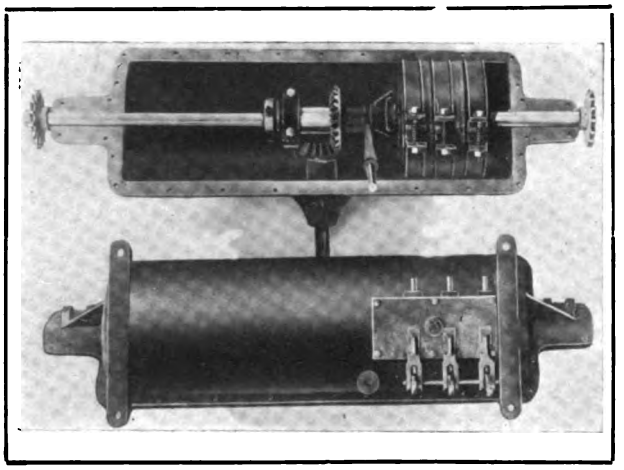
TRANSCONTINENTAL MOTOR DELIVERY.

The first attempt to utilize a motor truck in the delivery of merchandise across the country was begun in Philadelphia last month, when Charles W. Young & Co., of that city, consigned a three-ton load of goods to an Alco truck, made by the American Locomotive Company, New York City and Providence, R. I., for delivery to the Carson Currier Company, Petaluma, Cal. The distance to be traversed is approximately 4436 miles. The truck is equipped with a special steel body, and fitted with new United States demountable solid tires, made by the United States Tire Company, New York City. Its progress across the continent, by way of New York City, Albany, Buffalo, Chicago, etc., will be watched with interest.

KISSELKAR MAKES NEW RECORD.

A three-ton KisselKar truck, made by the Kissel Motor Car Company, Hartford, Wis., in climbing Mount Hamilton, Cal., recently, made a wonderful record. The mountain is said to be the steepest regularly travelled grade in the United States. The route

G. V. Electric Chassis Fitted as Bank Wagon.



was from San Jose to the Lick observatory, 4209 feet above sea level. The machine was loaded 50 per cent. beyond its capacity, and still covered the distance, which is 27 miles, in 6:25:00.

FEATURES OF THE KOEHLER.

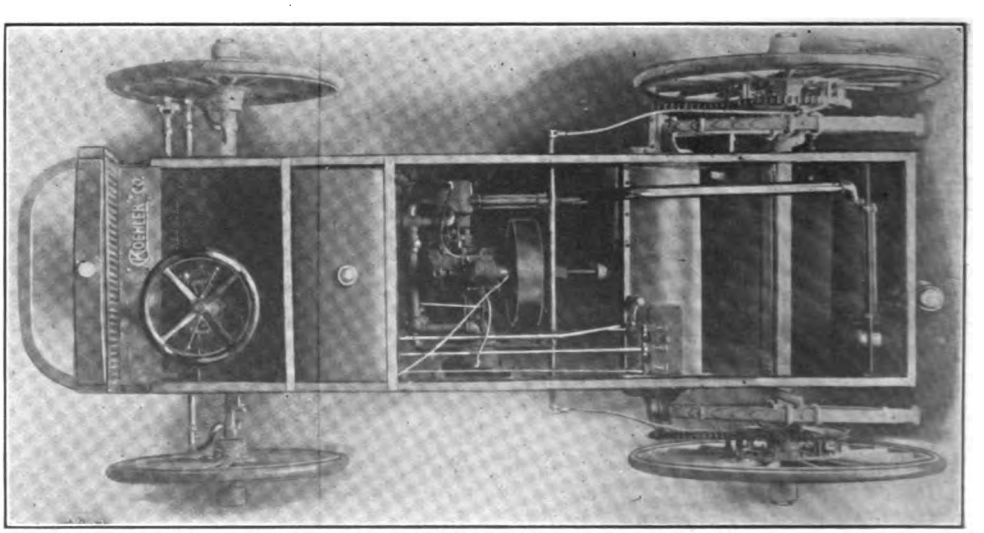
The Koehler light delivery wagon was designed by L. E. Schlotterback, one of the pioneers in the commercial vehicle industry, for the purpose of meeting specific demands in the economical transportation of

Digitized by Google

loads in various lines of business, such as the grocer, expressman, department store, etc. The design was decided upon only after a careful study of needs, and

Koehler Transmission, Clutch and Differential Enclosed in Oil Tight Housing.

an exhaustive test of various types with carrying capacities ranging from 500 pounds to 10 tons. The rated capacity of the car is 1600 pounds, and this rating is the result of the study and tests mentioned.



The car is made by the L. E. Schlotterback Manufacturing Company, Newark, N. J., and is marketed by the H. J. Koehler Sporting Goods Company of 1709 Broadway, New York City. It presents many interesting features, none the least of which is the provision for accessibility. Simple in construction and moderate in price, the Koehler 1600-pound wagon is expected to meet with a ready acceptance by the business public. The motor is a two-cylinder, four-cycle, water-cooled unit, of the horizontal opposed type, with bore of 5.25 inches and stroke of four. The horsepower rating is 22-24, although it is stated that it will develop considerably more than this when operating at its maximum efficiency. Ignition is by Bosch high-tension magneto located on top of the motor and driven by enclosed gears. A conventional type of float feed carburetor is employed, and the intake and exhaust manifolds are constructed to ample proportions.

The lubrication system is a combination of forced feed and splash, and all oil is filtered as it is drawn from the reservoir. Cooling is by the thermo-syphon system, through integral water jackets, made large to secure efficient cooling under continued operation. The extra large radiator is suspended on springs to eliminate vibration.

A straight line drive from motor to combined transmission and jackshaft is provided, and although there is no angle a universal joint is fitted. An innovation is the assembly of the clutch, transmission and jackshaft as a unit in an oil tight housing located transversely in the chassis. The transmission is planetary, and all gears are of a high grade chrome nickel steel, hardened throughout. The clutch bands for the low and reverse are semi-steel which cannot slip or burn, and the high speed clutch is a cone. Final drive is by double side chains.

The chassis frame is U shaped, of channel section steel, three by 1.5 inches, with curved end at the front, forming a solid and serviceable protection against damage to the radiator. The cross supports are substantial, and additional strength is secured by the fitting of a metal floor plate of sturdy design, to which are fastened all controlling parts.

The front axle is a one-piece drop forging 1.5 inches square with knuckle yokes integral. The rear axle is two inches square, and both members are constructed of 40 point carbon steel. Semi-elliptic springs are utilized in front and full elliptic members in the rear. Two sets of powerful brakes are provided, the service members being on the jackshaft, and the emergency, on the rear wheels.

General View of Koehler Chassis, Showing Simplicity of Construction and Accessibility of Components.

NEWS OF THE TRUCK FIELD.

In the final organization of the Krebs Commercial Car Company, Clyde, O., the following officers were elected: President, B. A. Becker; vice president, George Slessman; secretary, Homer Metzger; treas-

Digitized by Google

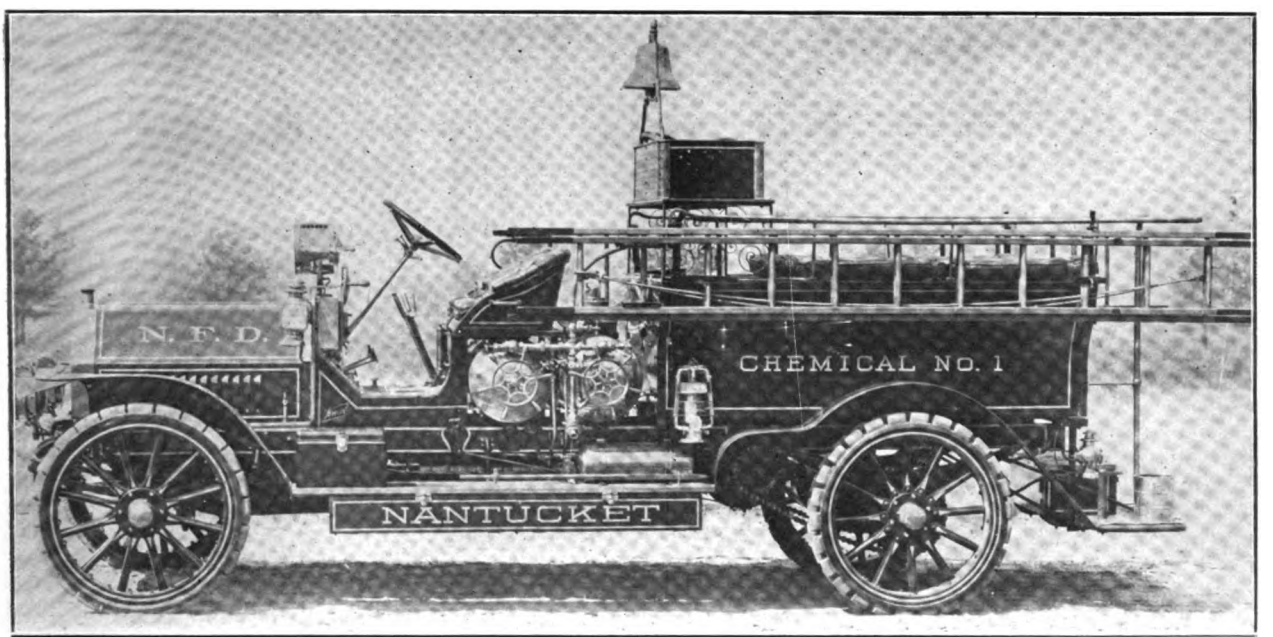
urer, Robert B. Jones; general manager, J. I. C. Krebs.

The Kearns Motor Car Company, Beavertown, Penn., is to erect a new factory building of concrete. A recent order received by the company called for the delivery of 100 trucks in New York City.

The Penn Unit Manufacturing Company has been incorporated, and is to have headquarters at Allentown, Penn., where a line of commercial motor vehicles will be made. The capitalization is $500,000, and James K. Bowen is the prime mover in the organization. S. Bruce Somervell will look after the sales end.

The Cleveland Motor Truck Company, Cleveland, O., and the Howard Automobile Company of Galion, in the same state, recently combined under the title of the Cleveland-Galion Truck Company. Heretofore both concerns have made trucks on a limited scale. It is planned to expand.

The manufacture of commercial vehicles in large numbers is to be commenced soon in Alhambra, Cal., by the merged Durocar Manufacturing Company and the Amalgamated Motor Company, both of Los Angeles. The new company is capitalized for $1,000,000.



The H. Lange Wagon Company is among the newer concerns to enter the motor truck manufacturing field. The company has a factory in Pittsburg, Penn., where carriages are also made. Trucks of one and two-ton capacities will be the only types manufactured at first.

The Nayasett Motor Company, Springfield, Mass., a consolidation of the Springfield Metal Body Company and the Brightwood Manufacturing Company, is planning to manufacture the S. P. A. trucks, which have been imported heretofore. The new concern is to continue to make the Orson car.

KNOX CHEMICAL FOR NANTUCKET.

Although the people of Nantucket, Mass., went to the legislature some few years ago with a successful appeal for a special statute forbidding the use of automobiles on the island, the city of Nantucket has purchased the Knox combination chemical and hose wagon shown in an accompanying illustration. The car, constructed by the Knox Automobile Company, Springfield, Mass., was delivered on the island last month, and now enjoys the distinction of being the only mechanically propelled vehicle with the legal right to be operated in that territory.

The chassis is the regular 50 horsepower model to which the Knox company fits fire fighting apparatus. In addition to two 35-gallon chemical tanks and the necessary chemical hose, it carries 1500 feet of regulation fire hose and all the other usual fire equipment.

Knox Chemical Wagon Delivered to Nantucket Fire Department and the Only Mechanically Propelled Vehicle Permitted to Be Operated on the Island.

One particular feature is the fitting of a Perkins automatic lighting system, by which the searchlight, side and tail lamps may be ignited instantly from the seat by pushing a button. In common with other Knox vehicles of this type, it is supplied with siren horn, an ordinary automobile horn and a locomotive bell.

The car has attracted no end of attention throughout Massachusetts, it having been sent over the road from the factory in Springfield to New Bedford, whence it was taken to the island by boat. E. P. Crocker, who will be the only licensed operator in Nantucket, has been at the Knox plant becoming thoroughly familiar with the construction and method of operation. In addition to the Knox combination vehicle, the fire fighting equipment of the island includes two hand drawn steamers.

SIXTH ANNUAL TOURING NUMBER.

In presenting its sixth annual Touring Number, The Automobile Journal feels confident its readers will join with it in declaring it the most comprehensive compilation of touring information ever offered in like form. The data have been collected from a large number of sources, and in their preparation this magazine has been aided materially by many individuals and concerns which it would be impossible to mention by name. Tourists are invited to co-operate with The Automobile Journal in making its bureau of information as complete and exhaustive as possible, and all requests for additional data will receive prompt attention.

NEED FOR UNIFORM LAWS.

The digest of motoring laws elsewhere in this issue suggests that much good work has been accomplished in the matter of reciprocal relations between the states. Most commonwealths provide that visiting motorists shall be exempt from registration during a specified period, while others permit full reciprocity. Those states which require special permits have been reduced almost to a negligible quantity, with the removal of New Jersey from the list.

It is impractical, in a compilation of this nature, to include all the provisions of the various laws. It has been believed that the tourist would desire general information rather than specific. A careful reading of different statutes reveals numerous minor details, which indicate the need for still more energetic effort on the part of organized motorists toward the adoption of laws which shall better meet the situation presented by the growth in transcontinental and interstate touring. This is especially true wherever local ordinances are permitted.

DEMANDING ORIGINAL PACKAGES.

Motorists who decide upon long distance touring will be prevailed upon to accept substitutes for standard brands of accessories and supplies which they may need while en route. In some of the localities visited it undoubtedly will be found that the garages and supply houses have little more than the transient trade which reaches them during the touring season. This may not be as true as in years past, but it is an ever present danger.

These men have little at stake. They never expect to cater to the needs of the same party a second time. Standard goods may net them a smaller margin of profit. Motorists should be particular to demand the original packages and where they are unable to get these, they should make every effort to reach a larger centre in which such supplies must necessarily be carried. The manufacturer's trade mark is the consumer's protection, quite as much as his own.

GOOD ROADS SITUATION.

That it is possible to present detailed itineraries covering a large portion of the United States, is a satisfactory commentary upon the growth of the good roads sentiment in America. The entire story of this issue is not told without the aid of the illustrations, and motorists and others will be somewhat surprised in studying these photographs to discover the very excellent highways which exist in place of the old Indian trails of other years in the Rocky mountain district, for instance.

In a more or less general way, it has been known in the East that the people of the West were decidedly interested in this problem, but the exact situation has not been brought to its attention so forcibly before. The good roads conventions appear to have served a useful purpose, at least insofar as these sections are concerned.

MOTORING NEWS OF NATIONAL IMPORT.

Stockholders Ratify Financial Plans of United States Rubber Company---General Motors Loses One of Its Most Capable Men---Other Appointments and Promotions Indicate Industry's Progress.

Stockholders of the United States Rubber Company, at a special meeting in New Brunswick, N. J., formally ratified the increase in capitalization to $120,000,000 and the conversion of the second preferred into first preferred stock. A meeting of the directors followed a few days later when a 20 per cent. extra common stock dividend, provided for in the financial plan, was declared. Fifty thousand shares of common stock are to be issued at par to the holders of the $25,000,000 now outstanding.

The directors also passed resolutions for the offering of 100,000 shares of first preferred stock at par to all the holders of three classes of stock to the extent of 12.5 per cent. of their present holdings. This offering is also a part of the general financial plan. The usual quarterly dividends of two per cent. on the first preferred, 1.5 per cent. on the second preferred and one per cent. on the common stock was declared, payable July 31 to holders of record July 6. President Colt presented a report which showed that after setting aside $1,200,000 to meet the dividends declared, the United States Rubber Company had in its treasury a balance of over $5,000,000 applicable to dividends, or more than enough to cover the 20 per cent. stock dividend on the common shares.

Immediately following the meetings of the stockholders and the directors, the latter started to put into operation the arrangement for procuring additional capital for the company. After declaring the regular quarterly dividends, the board announced a common stock dividend of 20 per cent., payable in such stock on July 8 to the holders of record of the common stock at the opening of business on that day.

Also it authorized the offer to the holders of record at 3 on the afternoon of July 12, of all the stock of the company of all classes then issued, including the holders of the new common stock, of the right ratably to subscribe for $10,000,000 of first preferred stock to the extent of 12.5 per cent. of their holdings.

MEAD NEW AMPLEX HEAD.

Hutchinson Leaves Marquette Company to Take His Place with Olds Motor Works.

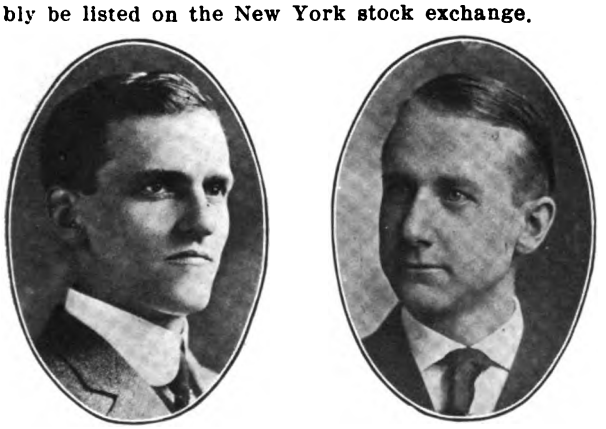
An announcement which means much to the industry is that of the retirement of W. J. Mead as vice president and general manager of the Olds Motor Works, Lansing, Mich., maker of the Oldsmobile, to become president and general manager of the reorganized Amplex Motor Car Company, Mishawaka, Ind., maker of Amplex cars. Mr. Mead was also a vice president of the General Motors Company. His place as head of the Oldsmobile establishment has been taken by Oliver C. Hutchinson, the former head of the Marquette Motor Company, Saginaw, Mich., makof Marquette cars.

In the departure of Mr. Mead the General Motors Company loses one of its best known and most capable men. Before his advent in the automobile field, he had made a decided success in the bicycle and sewing machine business. His first motor car experience was with the Jackson Automobile Company, Jackson, Mich., maker of Jacksoncars. In 1905 he joined the forces of the Buick Motor Company, Flint, Mich., maker of Buick cars, and for a time was manager of the Chicago salesrooms of that concern. Three years ago he became associated with the Olds Motor Works, and rapidly arose to distinction in the councils of the General Motors Company, acting as its head for a time.

W. J. Mead, President, Amplex Motor Car Company.

Mr. Hutchinson is well known in automobile circles. Under his management the Marquette, the newest production of the General Motors Company, first placed on the market for the 1912 season, has achieved a remarkable success. In this connection, it may be stated that plans are under way which involve the production of an entirely new model for 1913, and the work of Mr. Hutchinson will be carried on by a new manager, whose name the concern does not feel at liberty to divulge at present.

Respecting the Amplex plans, it is stated that under Mr. Mead's direction the factory will be enlarged



Digitized by Google

and brought up-to-date in every particular. It is understood that the sales end will be entirely separate, and that offices will be located in Chicago, probably on Michigan avenue. Special attention will be paid to the matter of the service department, through which owners of Amplex cars will be accorded most efficient co-operation.

OVERLAND PLANS EXPANSION.

Increase in Capital Stock to $15,000,000 Will Supply Money for New Buildings, Etc.

President John N. Willys of the Willys-Overland Company recently announced plans for increasing the capital stock of his company from $6,000,000 to $15,000,000, and the taking in of his various properties without change of status. When the increase is made, the capital stock will be divided into $10,000,000 preferred and $5,000,000 common. Willys will retain all of the common stock and the preferred will probably be listed on the New York stock exchange.

With Willys-Overland Company: At Left, Carl A. Neracher, Chief Engineer; at Right, Fred I. Tone, Engineer, Toledo Plant.

Arrangements are being made for the erection of four new factory buildings, the improvement of smaller ones and the employment of 3000 additional men. It is planned to double the capacity of the plant. All of the new buildings will be erected in Toledo, O. One will be in the rear of the present plant, and will be 700 by 100 feet and three stories in height. It will extend from the Lake Shore Railway nearly to Derby street. A second will be erected just west of the drop forge department fronting on Derby street, and will extend back to the new 700-foot building. The second structure will be 200 feet long, 70 feet wide and two stories in height. The third will be 130 by 60 feet, fronting on Derby street, and will be used as a garage. The Kinsey Manufacturing Company, one of the Willys concerns, will construct a new five-story building, 300 by 100 feet, on the corner of Derby street and West Central avenue.

It will be remembered that Willys recently purchased a controlling interest in the Gramm Motor Truck Company of Lima, O., maker of Gramm trucks. That it is the intention to operate these various concerns under one general management seems to be borne out by the appointment of Carl A. Neracher as chief engineer for Overland cars and Gramm trucks, although Fred A. Tone remains as engineer of the Overland plant in Toledo, and F. Bisantz of the Gramm plant in Lima.

Mr. Neracher was for several years chief engineer of the Garford Company, Elyria, O., maker of Garford pleasure and commercial lines, although his experience covers a much longer period. He is well known in the industry and is regarded as an engineer of marked ability. His headquarters will be at Toledo, from which point the sales policy of the Willys properties will be conducted.

MORGAN WITH MARION.

Becomes Chief Engineer of the Reorganized Concern Under President Handley.

Matthew B. Morgan, one of the best known automobile engineers in the country, has joined the James I. Handley forces as chief engineer of the Marion Motor Car Company. The selection of Mr. Morgan by President Handley provided one of the big surprises of recent date in automobile circles.

Mr. Morgan was chief engineer of the Chalmers Motor Company, Detroit, the past three years, producing the 1910, 1911 and 1912 models. Three years previous to associating himself with the Chalmers interests, Mr. Morgan was with the Olds Motor Works, Lansing, Mich., maker of the Oldsmobile. He first acted as assistant engineer, but was made engineer to take the place of Chief Engineer Dunham when the latter went to the Hudson Motor Car Company. The Oldsmobile six-cylinder is well known as one of his creations.

Before going to the Oldsmobile concern he was with the Packard Motor Car Company, Detroit, and with the Peerless Motor Car Company, Cleveland, O. In the Peerless factory he had work as special assistant to Chief Engineer L. P. Moore. Mr. Morgan says that he can base his fame on having designed the first racing car for Barney Oldfield, the famous "Green Dragon."

TO ESTABLISH BRANCHES.

Wagner to Direct the Sales Policy of Buffalo's $3,000,000 Electric Combine.

Howard E. Wagner, until recently sales manager of Wyckoff, Church & Partridge, Inc., New York City, has assumed his duties in the same capacity with the Buffalo Electric Company, Buffalo, N. Y. He will make his headquarters in Buffalo, and will take charge of the work of establishing branch houses in a number of cities throughout the country.

Digitized by Google

Mr. Wagner's association with the automobile industry dates from 1904, when he had charge of the selling of Pope Waverley electrics at Indianapolis, Ind. From 1906 to 1908 he managed the selling department for Babcock electric carriages for Wyckoff, Church & Partridge in New York, and in the latter year became branch manager for the Babcock Electric Carriage Company in that city.

Howard E. Wagner, Sales Manager, Buffalo Electric Company.

The Buffalo Electric Company was organized recently with capital of $1,000,000, being a consolidation of various electrical concerns in Buffalo, including the maker of the Babcock electric vehicles. The reorganized firm also will enter the field with electrically driven baggage trucks and commercial vehicles. Branch houses already have been established in Rochester, Buffalo, Chicago and Cleveland, and others undoubtedly will follow in all principal cities.

TEXAN WITH HENDERSON.

Ray Leeman, Versed in Contest Work, Publicity Manager for Indianapolis' New Car.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the new Henderson car, which made its initial appearance during the 500-mile race on the Indianapolis speedway, Memorial Day, is collecting its department heads from widely scattered points. Announcement has just been made of the appointment of Ray Leeman, advertising and publicity manager of the Overland Automobile Sales Company of Dallas, Tex., as publicity director.

Mr. Leeman has been prominent in the automobile industry of the Southwest for the past five years, and is considered an expert on runs, tours, etc. He was for some time manager of the Goodyear Tire & Rubber Company's branches in Houston and San Antonio, Tex., and his association with the Overland Sales Company placed him in direct personal relation with a large portion of the retail trade throughout that section of the country.

SIMPLEX COMPANY MOVES.

Demand for Its Product Makes Increase in Manufacturing Facilities an Absolute Necessity.

The Simplex Automobile Company recently found it necessary to remove its entire plant from New York City to New Brunswick, N. J., in order to keep pace with its rapidly growing business. The former factory building on the East river front has been entirely abandoned, but the service station in Long Island City and the retail branch at 59th street and Central Park South are being continued. The new factory building covers three city blocks, and it is the intention of the concern to materially increase its output.

ANOTHER MICHIGAN RECRUIT.

Chicago Expert on Advertising Methods Selected to Carry Out Plans Now Under Way.

As a further evidence of the extensive plans under way by the Michigan Buggy Company, Kalamazoo, Mich., maker of the Michigan car, comes the announcement of the appointment of George H. Daugherty as advertising manager. Following so closely upon the news of W. H. Cameron's selection as chief engineer, the industry is decidedly interested in these recent accessions to the Michigan forces.

Mr. Daugherty has had wide experience in handling automobile accounts, having superintended some of the most signal successes in this field. He has been connected with agency work for the past 10 years, his first work in this line being with the Long-Critchfield Corporation, the predecessor of the Taylor-Critchfield Agency. During the past few years he has been an investigating member of the advisory board of Lord & Thomas, the Chicago advertising agency, and has travelled widely, developing the advertising possibilities of many of the most important accounts handled by that house.

George H. Daugherty, Advertising Manager, Michigan Buggy Company.

PREPARING THE CAR'S EQUIPMENT.

Outlining the Necessary Overhaul of the Standard Fittings and Suggesting Methods of Their Proper Installation for Successful Long Distance Touring.

ASSUMING that the motor car has been placed in first class condition for the tour, its equipment should receive the same treatment. This is quite as important in every way, and has an equal bearing upon the pleasure of the outing. The various standard accessories, such as the top, side curtains, windshields, lamps, tires, tubes, etc., should be subjected to a thorough inspection and any needed repairs or replacements made.

The most important of these are the shoes and tubes, and their examination should be very complete. Some make it a practise to fit new members all around, carrying those replaced as spares, while others prefer to obtain the last possible mile from the old tires, taking new ones and making changes as required. In either case, the wheels of the car should be jacked up, the shoes removed, cleaned and gone over, marking each cut for repairs and weak places in the fabric for reinforcement. The inner tubes also should be examined, testing each, especially if an old one, by inflating and noting the condition of the rubber. If in doubt respecting this, take it to a tire man and have him pass upon it, as well as upon any questionable shoe. This may save trouble on the road.

Showing Extra Casing on Running Board, Demountable Rims and Windshield—Note Method of Utilizing Anti-Skid Shoes on High Forward and Off Rear Wheels.

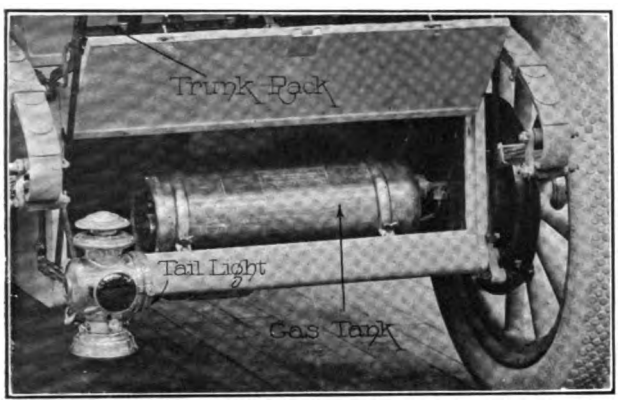
Clean Rims Aid Tire Changing.

Before replacing the tires, clean the rims with sandpaper and remove any rough places that may have been occasioned by riding on a flat tire. Although many advocate painting the rims to make easy the changing of shoes, the writer recommends the use of graphite, as this material applied with enough oil to make a thick paste will exclude water and prevent rusting. The paste should be applied freely, afterwards rubbing well with a cloth which will leave a highly polished surface. Demountable rims, including those fitted with bolts and locking nuts, should be treated similarly.

The number of new or extra shoes to be carried will depend to a certain extent upon the condition of those on the machine and how severe it is upon casings. If the same size tires are utilized all around, one or two extra members may suffice, but where different sizes are fitted to the front and rear wheels, it is advisable to carry at least one extra envelope for each. But it is an excellent plan to take plenty of inner tubes, as it is possible that half a dozen punctures will occur in one day, and it is anything but pleasant to patch tubes by the roadside.

Holders for Extra Tires.

Although many cars are fitted with tire holders capable of carrying one or two shoes, it may be that the motorist will desire to include three or more in the equipment and when such is the case it may be necessary to strap the extra casing to the holder. There are several ways of securing the shoes as will be noted in the accompanying illustrations, but irrespective of the method adopted care should be exercised that the members do not project too far from the running board as they may be torn off when passing another machine on narrow highways. If the holders are not equipped with a locking device it is an excellent plan to fit one, preventing theft. Locks also should be fitted to the tool box and other compartments.



The Lighting System.

Next in order are the lights and it is vitally important that the lighting system be overhauled thoroughly. Beginning first with the oil lamps, side and tail, these should be removed from the car, any leaks soldered, and broken or cracked glasses replaced with new. It may be possible that the wicks are short, preventing the burning of all the kerosene and when such is the case it is well to fit new. In cleaning the lamps remove all soot that has accumulated at the top, for if the members have been smoking it may have been due to the draught being partially stopped. With a little effort, aided by polish, the interior and exterior of the lights may be improved greatly. After renewing the supply of oil, replace the lamps, noting if the brackets and retaining screws are secure and in good condition.

The acetylene headlights should be removed from their brackets, the lenses and glasses tested for looseness, and if cracked or broken replaced with new. The mirrors may be cleaned by utilizing a little warm water, soap and a soft cloth, polishing with tissue paper.

Digitized by Google

The burners may be clogged and these may be cleaned by employing a tire pump or with a needle device adapted for this work. Next examine the tubing

How One Owner Fits Gas Tank, an Arrangement Making for Neatness as Well as the Prevention of Theft.

leading from the main line to the lamps. This material is affected by the weather and if tiny cracks be noted, replace the rubber with new. While these connections are removed, and those between the tank or generator, clean out the metal tubing, as a poor flame at the burners may be caused by deposits which accumulate in the pipes.

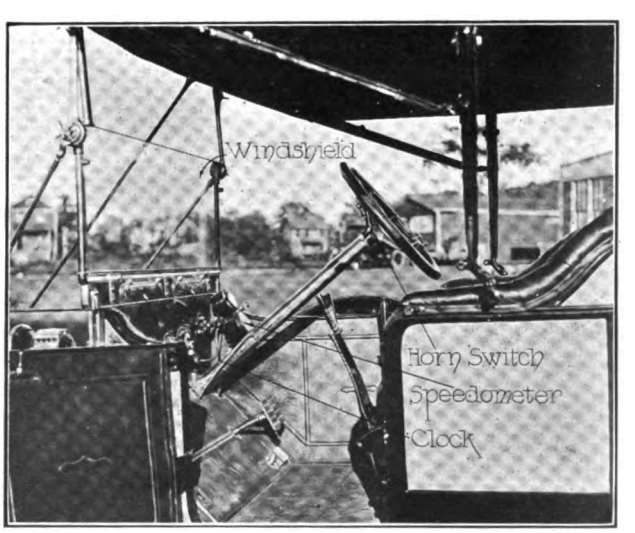
If a gas tank is employed, examine the brackets and tighten any loose nuts, also note the amount of acetylene shown by the gauge. If low secure a new tank, although these members are exchanged easily, being carried by the majority of garages, especially those catering to the tourist trade. If the car is equipped with a generator this device should be given a thorough cleaning after which the retaining straps or bolts should be tightened. Before leaving the lighting equipment, turn on the gas and light the lamps, noting the condition of the flame and examining for possible leaks.

Electric Lighting Equipment.

As many cars are now equipped with electric lighting outfits a few suggestions as to their care will not be amiss. The wiring system should be gone over carefully for chafed places, and any loose connections repaired. The instructions of the maker of the generator should be carried out to the letter. Where a straight battery system is employed the current container should be removed and fully charged. Extra bulbs may not be necessary but it is a good idea to have them in the event of trouble and they should be packed carefully in cotton batting and so stored that they will not be subjected to shocks.

Horn and Signalling Device.

As the laws of some states are very strict regarding the use of a signal, prohibiting the utilization of other than the ordinary horn in the cities, it is an excellent plan to inspect this member. It may be possible that a new reed is needed or the bulb is cracked. Relative to exhaust signals, these will require but little attention other than cleaning. Electrically operated devices should be given the care recommended by the maker and if actuated by dry cells, the latter tested and new ones procured if the amperage is low. The wiring and switches also should be inspected for chafed places which might create short circuits.

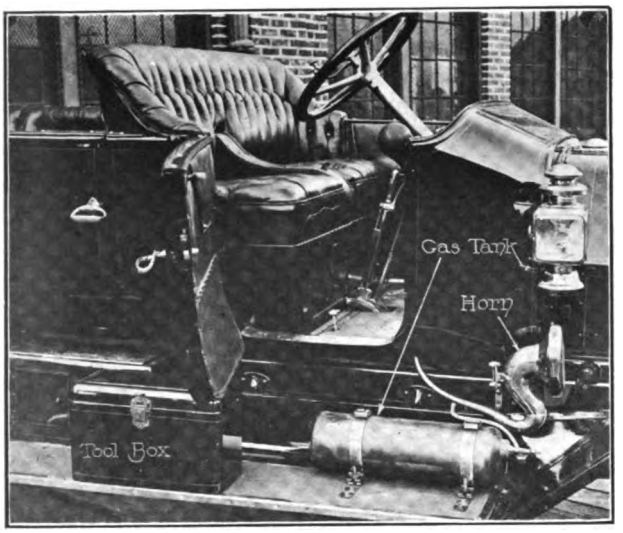


Speedometer Is Important.

It is surprising to note the number of motorists who do not give their speedometers any attention whatever and when in need of repairs delay the work. This device is decidedly important in touring as in passing through different states, and even cities, the speed limits are ever changing and it is essential that the speedometer be efficient as well as in proper working condition. It is needless to point out that the pleasures of the tour are marred by delays due to a violation of the speed laws and the subsequent visit to the police court, to say nothing of the expense involved.

Tops, Curtains and Windshield.

The discriminating motorist will put up, brush and clean the top, noting during the work if the retaining straps and their connections are in good condition. This also applies to the slip cover. The sewing may have started due to careless handling, or small tears may be present which will develop into larger ones, besides detracting from the appearance of the machine. Leather tops may be given a smart appearance by the application of a suitable dressing while others may be cleaned. The shabby look of some tops is due to carelessness in folding these members. At the same time, look over the side curtains, making sure that the complete set is in the car and that the fasteners are intact.



The windshield should be gone over carefully and loose nuts and bolts secured, cleaning the glass and

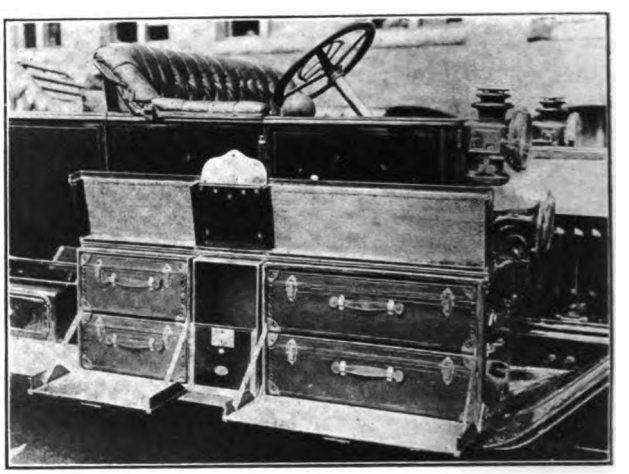
Outlining Convenient Location of Electric Horn Switch on Hand Wheel and Installation of Combined Clock and Speedometer.

eliminating any rattles which may be present. Look over the fastenings of the trunk rack as this precaution may save the loss of valuable baggage. The

Digitized by Google

Showing How Gas Tank and Tool Box May Be Fitted to Running Board Without Interfering with Entrance of Driver.

number plates should be given attention and if suspended by straps examine the leathers for chafed places. Where fitted through the radiator inspect for play as the fins of the cooler may be chafed through, creating leaks. If the itinerary includes states where the tourists' privileges are limited, make provision for the fitting of the extra license tags.



Tool Equipment.

The tool equipment and number of spare parts will depend upon the machine and the itinerary. If the tour be through territory where the roads are in poor condition and where the motorist will have to rely upon his skill in the event of trouble, it is obvious that the equipment should be more complete. While it is advisable to carry a set of practical working tools, there are numerous devices which may appear indispensible to the novice that can be left at home. The experienced motorist eliminates as much as possible all extra weight, having in mind the strain upon the tires as well as the comfort of the passengers.

A very complete tool equipment, and one which will enable the undertaking of ordinary roadside repairs, is presented in an accompanying illustration. It may be augmented by special tools among which may be mentioned a set of socket wrenches, a small vise, hacksaw and blades, soldering outfit, valve lifter, wheel puller, and those tools specially designed for the car.

Some Necessary Articles.

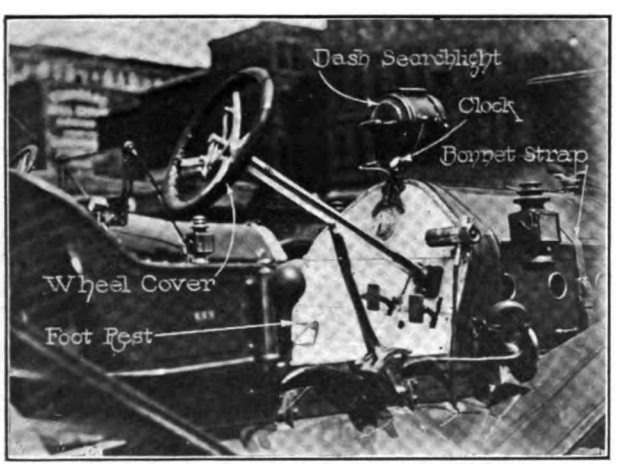
Of course, a jack and tire pump should be included as well as the tire and tube repair outfit, these and the tire irons being optional with the motorist. As tires should not be inflated by guess work, a tire gauge is indispensable. One or two blow-out patches and outer sleeves may come in handy as will a collapsible bucket for refilling the radiator or washing after a roadside repair. A can of hand soap and a bar of ordinary soap will be useful, especially the lat-

Outlining Special Trunk for Running Board, Accommodating Four Cases and Provided with Locks.

ter for stopping gasoline leaks. Include a chamois in the equipment and make it a rule never to refill the fuel tank without straining the gasoline, as it will save considerable carburetor trouble. Funnels for oil and water will not occupy much room although the latter may be dispensed with if desired. A combination grease and oil gun can be stored conveniently and a small can of grease for renewing the supply in the various cups is essential unless this work is done at the garages.

In former seasons many tourists made it a practise to carry a supply of oil and while it is an excellent plan to carry a gallon, practically every garage handles sealed packages of the leading and representative oil concerns of the country. In renewing the supply of lubricant the motorist cannot be too careful in demanding the original packages, which is a protection to himself as well as the maker.

Include a box of assorted cotter pins, lock washers, cap screws, taper pins, nuts and bolts in the

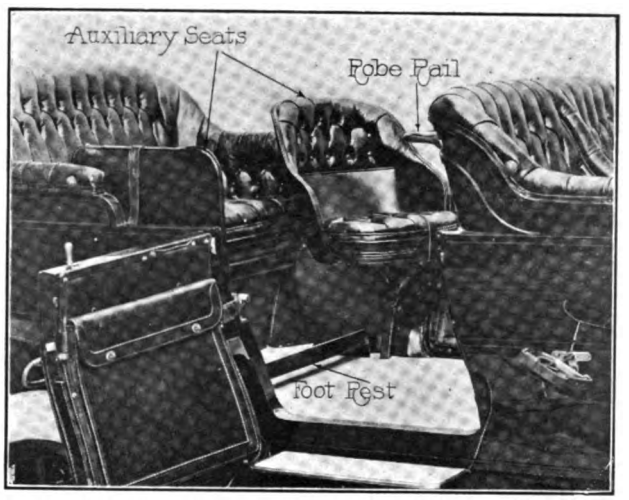


Extra Shoes May Be Carried at the Rear When the Design of the Car Favors Such Location.

Digitized by Google

equipment, also a roll of first quality friction tape and a sheet or so of emery cloth. A small quantity of valve grinding compound will be useful, in case a new valve must be fitted or the old members reground. A little candle wicking, cotton twine and waste or old cloths will not take up much room and will be of service. A few extra gaskets for the intake and exhaust members and circulation system should be included, and these may be either purchased or made, depending upon the design of the power plant.

An electric trouble lamp is a valuable acquisition to the tool equipment as by it repairs about the power plant may be made safely. The cord should be of sufficient length to permit working around the machine and provided with practical terminals. No motorist should attempt a trip without extra spark plugs and several of these may be carried in a special case which will protect them from injury. A few primary and secondary terminals and wire may be included if desired, as the material may be of service.



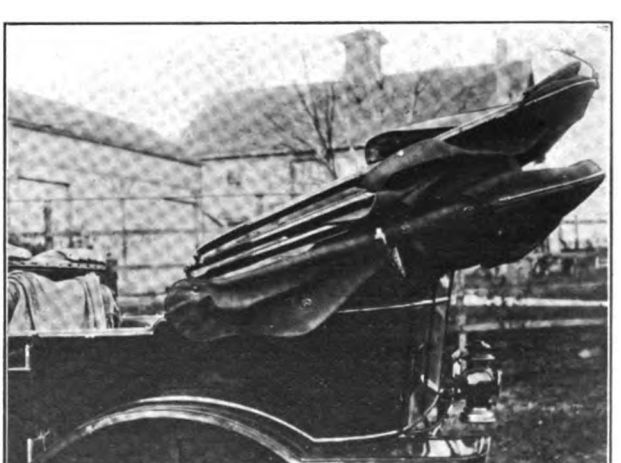
The Swinging Dash Type of Light Is Valuable in Touring—The Equipment Also Includes Clock on Lamp, Foot Rail, and Covered Hand Wheel.

No equipment is complete without a set of tire chains as these members will be invaluable in traversing roads where traction is difficult. If the old chains are worn, procure a new set and try them on the wheels to make sure they are the proper size as well as that they fit accurately. In connection with these devices a tool for making repairs may be included.

Spare or Extra Parts.

The number of spare parts depends upon the car, its mechanical condition and weaknesses. In this the motorist must be guided by his knowledge of his machine. The extent of the equipment is largely a matter of individual taste and there are many useful as well as practical accessories which will be of value on the tour and which are described elsewhere in this issue and from which the tourist may make his selection.

In storing the touring equipment the articles should be so arranged as to permit of easy access to those which will be used most frequently. The



If the Tonneau Is Roomy Auxiliary Seats May Be Fitted to Accommodate Extra Passengers—The Illustration Depicts the Folding and Pullman Types.

trunks and baggage should be covered with a dust and water proof cover and where extra dress suit cases are carried in the tonneau these arranged so that they will not shift, creating inconvenience to the passengers. Where possible the load may be lightened by expressing some of the baggage ahead.

C. H. SNOKE NEW MANAGER.

C. H. Snoke went to Sioux Falls, S. D., recently to take charge of the South Dakota branch of the Studebaker Corporation, with headquarters in Detroit. Mr. Snoke is the successor of C. E. Stubbins, who has gone to Kansas City, Mo. For the past three years he has been manager of the Studebaker branch in Oklahoma City, and previous to that had the management of the Minneapolis branch. He is a young man of wide experience in the automobile business, and has been with the Studebaker concern for about 16 years.

R-C-H MODELS FOR 1913.

WITH the announcement by the R-C-H Corporation, Detroit, Mich., of cars it will produce for the 1913 season, is the statement that the company proposes to build 30,000 machines of the different types. The magnitude of this production is almost beyond the comprehension of the layman, and from the viewpoint of the manufacturer it is an undertaking of enormous proportions, because of the manufacturing facilities necessary to build the machines and the selling organization essential to marketing them. It is pointed out that this is the first instance in the history of the industry when a company, just entering its second year of existence, ever inaugurated such ambitious business plans.

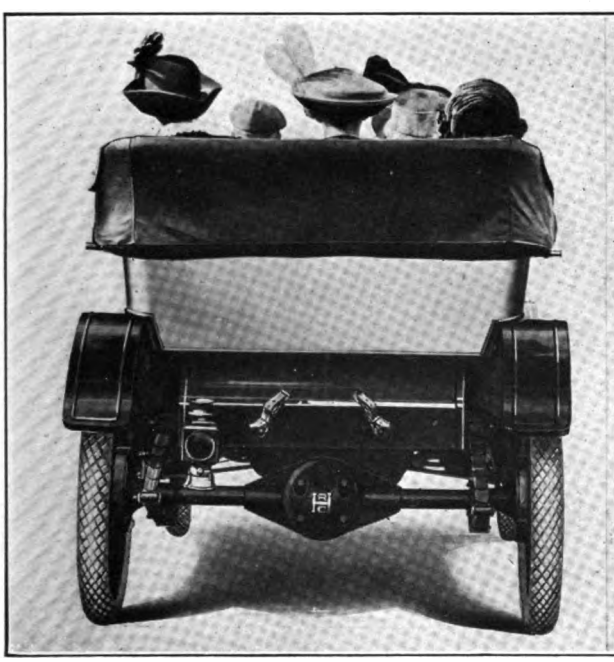
R-C-H Touring Car, Completely Equipped, Showing Top and Seats Enclosed by Jiffy Curtains, the Bullet Electric Head and Dash Lamps, and the Anti-Skid Tires on Demountable Rims.

The success of the R-C-H Corporation has been remarkable in many ways, but one of the reasons that impelled it to plan what may appear to be extremes is the fact that its cars are now sold in no less than 35 different countries, with the prospect that this number will be so increased during the year to come that it will be represented by active and aggressive agents in practically every market of the world. The fact that the R-C-H car has been exploited as a low priced vehicle, standardized in production, of sufficient power to do any work that may be required of it, with full automobile capacity, constructed to well tried and perfected design, of high class material, and with every quality guaranteed, has established it as one of the leading American cars.

The R-C-H car was developed before it was placed in the market. This means that it was designed with the greatest of care to meet the requirements of those who desire a machine of this type, and in this design was embodied all of the qualities that had been sought by motor vehicle designers, based on sound engineering and the use of every material that would insure endurance and service. In other words the maker sought to provide against every result that might eventuate from wear and use, and made liberal margins of safety in every component subject to stresses and strains. Nothing experimental was considered, and so the R-C-H car may be regarded as an industrial development of unusual merit, every detail being figured with the exacting care of commercialism and the entire construction harmonized for uniform results throughout.

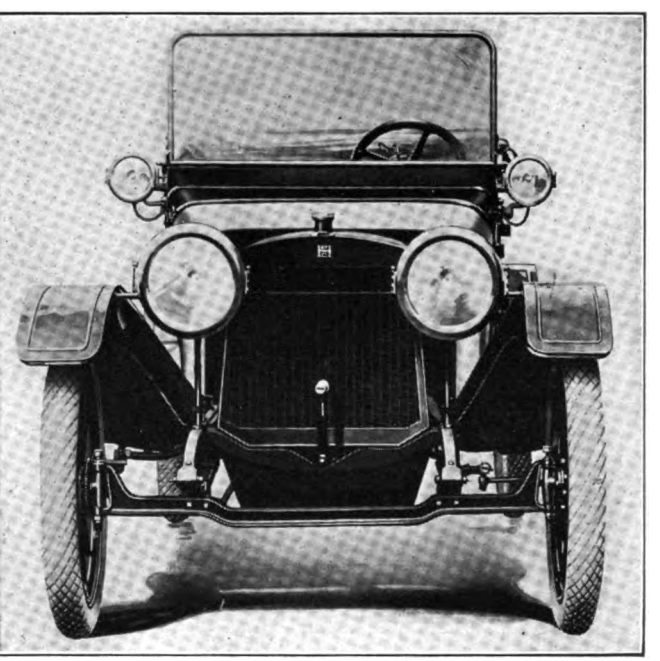
Because of the manner in which the R-C-H design was created it is not to be assumed that changes of

Digitized by Google



a material character have been made in the machines that will be built for 1913. As a matter of fact one of the strongest indorsements of the vehicles is that they differ but slightly from those of the previous season, for with an experience with the thousands of machines in all conditions of service no valid reason has been found for departure from the original design, material and construction.

It is claimed for this car that it has more drop forged parts than any other vehicle produced in America, and that these have been used wherever practicable, that high carbon manganese steel is used in all components requiring unusual strength and endurance, and that chrome nickel steel is used throughout all shafts and gears in the transmission and rear axle.



The maker maintains that in no case has a popular priced car been placed in the market that is so completely equipped as is the R-C-H, nor with equipment of so high a quality. For the standard price is included not only a machine that is recognized as being in every way dependable, but every installation that will add to the utility, serviceability and convenience of the owner, with every regard for use and appearance. That is, every accessory is regarded in the market as being not only standard, but a high standard as well, that is certain to give satisfaction from every point of view; not mere necessities, but whatever will increase the comfort of the driver and those accompanying him, affording fullest protection, shelter and facility for giving desirable attention or necessary work, either on the road or in the garage.

To enumerate: The wheels are fitted with demountable rims and these are shod with 32 by 3.5-inch non-skid tires, and there is an extra rim and holders for carrying the rim and ready inflated tire; a handsome Fairfield rubber top, one of the most durable of shelters, is installed, it being possible to raise or lower this with comparative ease, it being supported by straps attached to the forward end of the chassis frame; Jiffy curtains, which may be attached or detached while sitting in the seats of the car, may be used to completely enclose the sides of the machine above the seats and below the top proper; a substantial top cover; a windshield that is constructed integral with the body and may be raised or lowered or adjusted at any angle; a Tally-Ho bulb horn that is concealed under the hood and with the bulb mounted on the steering column or at the side of the car; a rear-view mirror, by which the driver may view the traffic conditions of the highway behind him without turning; 12-inch bullet type electric head lamps with double parabolic lenses; six-inch bullet type electric dash lamps with parabolic lenses; a Warner type 30 auto-meter, a robe rail, lifting jack, tire tools, tire repair kit, tire pump, and the usual kit of tools for adjustment or other work about the car.

The R-C-H car is driven from the left side, a quality that has been featured in many of the highest priced machines, and the control levers are located in the centre between the two front seat passengers and at the right of the driver. In this respect the vehicle is unusually well adapted for use in traffic and it is especially convenient for the occupants of both seats, in that all may enter or leave the car with equal ease, and the right side may always be at the curbing line. As the traffic regulations of many cities require that

Head-On View of the R-C-H Touring Car, Showing Details of Equipment.

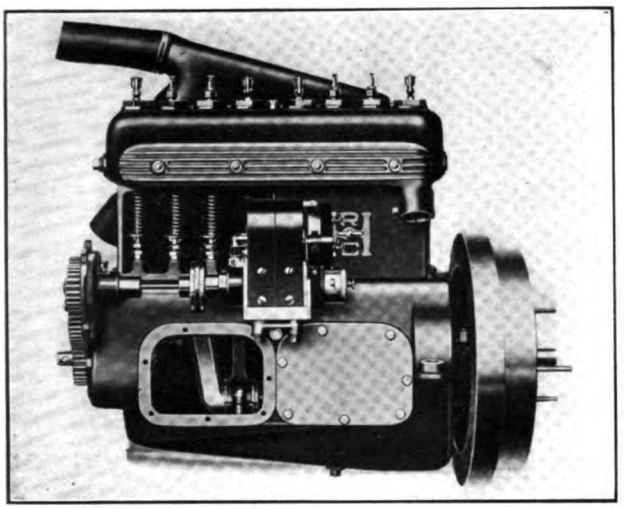
Digitized by Google

a car be with its right side only to the sidewalk, and as side levers, tires, etc., may obstruct the right running board, the cleanliness, comfort and convenience of the R-C-H, particularly for women passengers, whether a touring car or roadster, is apparent.

The policy of the R-C-H Corporation is that what were once luxuries with the motorist have become necessities because the vehicles are used practically all the time and under conditions and circumstances that were unusual but a season or two ago, and to meet with the requirements of the people the practical car must have whatever is needed, so that for the one price the purchaser will have a machine so complete that nothing more will be essential. That is, the price will be for all, and instead of buying a car and equipping it with one article bought here, and another there, and installed by inexperienced or indifferent workmen, it will be received as a harmonious whole, and at a cost that will mean a large saving were all equipment bought and installed as need suggested, to say nothing of the cost of labor and the appearance of the machine.

The R-C-H Touring Car Chassis, Illustrating Every Detail of the Power Plant, the Clutch and Driving System, the Transmission Gearset, Rear and Front Axles, Brakes and Control.

The R-C-H chassis is made in two types, that with 110-inch wheelbase being for the touring cars, and the other of 86-inch wheelbase being a runabout. These have the same design and construction and differ in length of chassis frame, and driving system. Otherwise they are identical. In the description that follows the touring car chassis is detailed.



The R-C-H motor is a single type and it is a four-cylinder, four-cycle, water-cooled engine of the L head form with the cylinders cast en bloc, this being a practise adopted very generally abroad. This design gives a very rigid casting of extreme simplicity and it permits the use of a two-bearing crankshaft, which minimizes motor length and weight and insures against deterioration under vibratory stresses. The motor has a cylinder bore of 3.25 inches and a stroke of five inches, and it is rated by the maker as 25 horsepower. It is stated that driven to 1700 revolutions by dynamometer test the engine has developed 27 horsepower. Because of the fact that the S. A. E. standard formula does not establish a value for stroke when this exceeds the bore this rating is not given.

The cylinder block is made of an excellent quality of fine gray iron with the water jacket cast integral and with a large opening over the cylinder heads. The valve pockets are at the left side and at the ends webs extend to the full width of the block, forming a recess below the pockets in which the valve mechanism is enclosed. The water jacket is large and the spaces liberal, the inlet being at the forward end on the right side, this inlet being cast integral with the block, and the outlet manifold extends the length of the block and is incorporated with a plate that covers the top of the cylinder heads. The size of the openings permits a very thorough cleaning of the core sand and there are no obstructions to the flow of the water. The base of the casting has wide flanges that are bolted to the engine case. The cylinder block is machined and bored, aged and reamed and then ground to size. The pistons are of the same material as the cylinders and are cast with heavy bosses for the wristpins. These are turned and ground to fit and are channelled for three rings, which are fitted above the wristpin bosses.

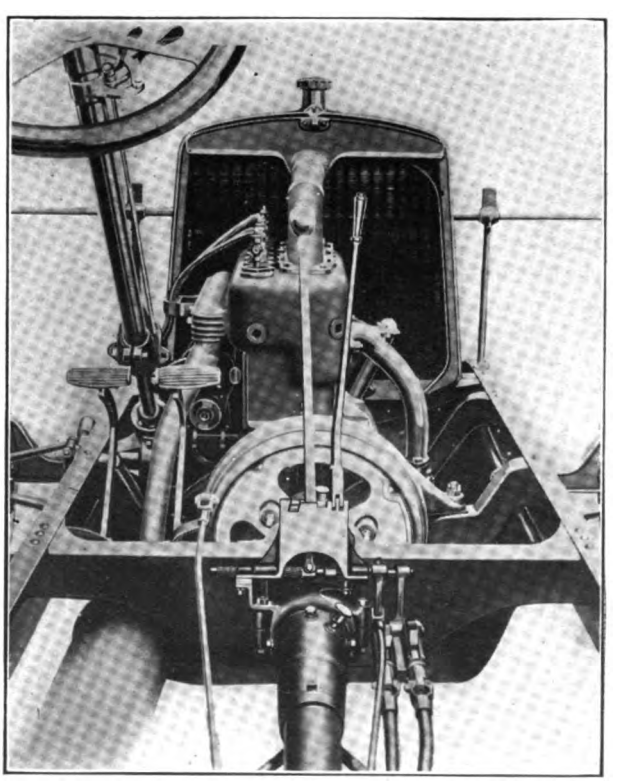
The crankcase is an iron casting of barrel form with heavy forward end web, with the bottom formed with an oil reservoir at the rear, and two cross webs that prevent the movement of the lubricant in the base. There is drainage through these webs into the oil sump, which is U shaped and is at the extreme rear of the case. At the left side are two large in-

Digitized by Google

spection plates and by removing these examination can be made or work done on the connecting rod big ends, and the main bearings can be reached. The rear

Valve Side of R-C-H Motor, with Valve Mechanism, Timing Gears and Engine Case Covers Removed.

end of the crankcase is closed by a heavy plate that carries the rear and main camshaft bearings and is bolted to the case. In assembling the crankshaft and the camshaft are placed into the case from the rear. The design is simple and the construction substantial.



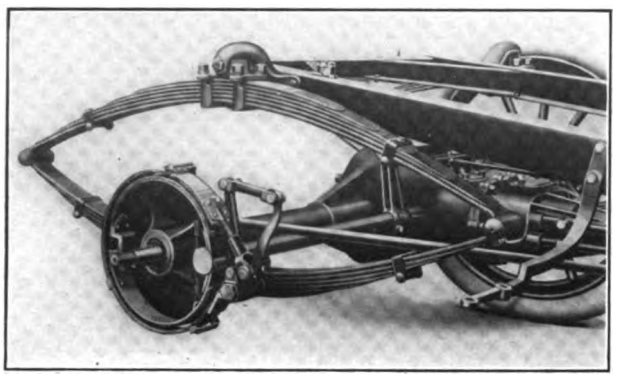
The crankshaft is a nickel steel drop forging, carefully machined and ground to 1.825 inches diameter at the main and connecting rod bearings, and of such strength as to effectually resist all stresses. It is mounted on two long bearings of Parsons' white bronze. The connecting rods are special steel drop forgings and these are fitted with Parsons' white bronze bearings of liberal length for the crankpins, the caps being bolted and provided with shims for adjustment for wear. The small ends are clamped firmly to the wristpins, which are of large size, of special steel, hardened and ground, that have bearing in the cast iron bosses of the pistons. The camshaft is a high grade steel drop forging that is machined and ground to size with the cams integral, the cams being large and designed for endurance. The shaft is mounted on two long end bearings of phosphor bronze.

The timing gears are of special steel, of large diameter and wide faces, and these are protected by a cast iron housing that encloses them. They are cut off from the crankcase proper and are carried on large and substantial bearings.

The valve action is conventional in that the ports are large and the valves, with nickel steel heads electrically welded to stems of high carbon steel, have a sufficient clearance to insure a complete cleaning of the cylinders and full charges of fuel. The valve guides are cast in the cylinder block and are unusually long to have endurance. The springs are large and are designed to resist the heat of the motor and retain their temper. The tappet rods are of special steel and are ground to size and hardened, the upper ends being fitted with hardened screws and nuts for adjustment and with fibre inserts to prevent noise. The valves are enclosed by plates that are retained by wing finger nuts on retaining bolts anchored in the cylinder block. They can be exposed in an instant when desired.

The motor is cooled by the thermo-syphon system, the capacity of the radiator and motor being 3.5 gallons. The radiator is large and there is an uninterrupted flow of the water through the engine and the radiator, the manifolds being very large and with easy curves that insure against obstruction. The water capacity is sufficient to effectually cool the engine under all conditions of operation. There are no complications and the system is the acme of simplicity.

The ignition is by a Bosch high-tension magneto without auxiliary of any kind, this being regarded as the most satisfactory form, as the car can be started with a quarter-turn of the crank, and the wiring consists merely of the four leads from the magneto distributor to the spark plugs and the ground wire through the switch on the dash. The magneto is installed at the left side of the motor and is driven by an outside shaft from the timing gear. The cable



Power Plant, Clutch and Control Assembly of the R-C-H Chassis, and the Forward End of the Torsion Tube.

leads are carried up to the spark plugs through a fibre block clamped to the engine block and are held securely from contacts and there is fullest protection

against short circuits and worn insulation.

The engine is lubricated by a constant level splash system for the crankshaft and crankpin bearings, the

Rear Axle, Brake and Spring Assembly of the R-C-H Chassis, Showing the Swivelled Spring Hangers.

camshaft bearings, the valve tappets, the wristpin bearings, and the cylinder and piston walls. The oil reservoir, with two quarts capacity, is at the rear of the engine case, and it is a U shaped well in which a wheel with miniature buckets in its periphery is driven by frictional contact with a disc mounted on the crankshaft just ahead of the rear main bearing. This wheel carries oil from the well to two ducts that are cast on the sides of the crankcase. The oil flows in these ducts to four U shaped steel troughs or pits that are fitted beneath each connecting rod big end cap, and flanges or scoops attached to the caps sweep into each trough for a period each revolution of the shaft, throwing the lubricant about the interior of the motor in the form of a fine spray. The ducts are inclined about 15 degrees toward the forward end, and the flow is such that there is always an abundant supply of oil when the machine is climbing a grade, and the cross webs of the case prevent a flow of the oil toward the forward compartments from the well, when descending. The excess oil from the troughs and the drainage from the walls and bearings flows back to the well and is used so long as it is supplied. The oil is placed in the crankcase through a breather pipe, and high and low level cocks permit the driver to ascertain instantly the condition of the lubricant supply. The timing gears at the forward end of the motor are packed with a light grease in which they revolve and are thoroughly protected from wear.

The fuel is carburetted by a float feed carburetor, automatic in its action, that has but two adjustments and is extremely simple in construction. It is claimed to be remarkably efficient under all conditions of operation, and with the power of the long stroke motor it is the experience of many owners that from 20 to 25 miles may be driven to the gallon of fuel. The carburetor has a hot air intake to insure a temperature that will completely vaporize the gasoline, and the long riser from the carburetor to the manifold cast integral with the cylinder block is without obstruction to a free flow of the gas. The exhaust header of the manifold is cast separately and is ribbed for more effective radiation. It is large and straight and the lead to the muffler is without obstruction. It is claimed that tests have been made with the motor completely silenced and with the exhaust header removed, without any perceptible difference in the horsepower production.

The flywheel is cast with fan spokes and the inner periphery of the wheel forms the female member of the clutch. The cone is a skeleton type to permit a draft of air through the flywheel and to secure lightness as well. It is 11.5 inches diameter and 1.75-inch face, carrying a facing of high grade leather. This facing is mounted over a series of springs to insure ease of engagement and four clamps that are recessed into the face of the cone and are retained by nuts holding the facing firmly. The springs may be easily adjusted when necessary, and the renewal of a facing can be accomplished without trouble with material purchased and cut at any leather shop. The clutch is operated with comparatively slight pressure and is very efficient.

The motor is mounted on two cross members, at the centre of the forward member and at either side of the rear, this making effective three point suspension. Directly back of the clutch is another cross frame member that carries the clutch shaft, and behind this is a second cross frame member that supports the forward end of the torsion tube housing the driving shaft.

Above the forward end of the torsion tube, and supported by the tube and the cross member, are the quadrants and mounts of the speed changing and emergency brake levers. The torsion tube is of steel, with heavy walls, and the forward section of it carries the ends of the radius rods. The rear end is attached to a section that forms a part of the transmission gearset housing, and this is bolted to the cen-

Forward Seat and Control Members of the R-C-H Touring Car, with Accessories Installed.

tral section or shell for the differential gears of the semi-floating rear axle. The driving shaft is 1.125 inches diameter. The forward end of the torsion tube

Digitized by Google

is spherical in shape and this is fitted into a globe socket attached to the heavy cross member. There is a universal joint coupling the clutch and the driving shafts. The shaft is carried on two long roller bearings. The rear bearing carries the sleeve which couples the ends of the driving and transmission shafts.

The gearset is a selective sliding type with three forward speeds and reverse, and it is operated by linkage with the lever at the forward end of the torsion tube. The driving pinion is integral with the transmission shaft. The shafts are of chrome nickel steel, and the gears are wide face, of the same material, all heat treated to give the greatest strength. The jackshaft bearings are of phosphor bronze. The differential is a bevel gear type with four bevel pinions. The bevel gear spider is forged solid of chrome nickel steel, ground on the bearing surfaces and is unusually strong. The differential is mounted on annular ball and heavy roller bearings. The differential may be examined and removed by taking off an inspection plate at the rear of the axle housing. The rear axle housing is of malleable iron and steel tube. The driving axles are of nickel steel and the outer ends are carried on large roller bearings. The wheels have large hub flanges and are keyed to the ends of the driving shafts. The alignment of the axle is preserved by two steel radius rods extending from the brake drum flanges to the forward end of the torsion tube. The rear axle and transmission can be removed by taking out four bolts without dismantling any other portion of the mechanism.

The front axle is drop forged from high grade steel and is I section, dropped in the centre. The yokes are large and the steering pivots and spindles are of corresponding size. The tiebar is behind the axle for protection and the draglink is heavy and adjustable for wear. The forward wheel bearings are the cup and cone ball bearing type. The wheels are of second growth hickory, 12 spokes to each wheel, and are fitted with demountable rims and 32 by 3.5-inch tires.

The frame of the chassis is of pressed steel channel section of ample strength and it is reinforced by five cross members, hot riveted, with gussets formed integral with the members. This is carried on semi-elliptic springs forward and full elliptic springs at the rear, the rear springs being on swivelled seats with the forward ends slightly elevated to absorb the stresses of road shocks.

The control of the car is by a clutch pedal operated by the left foot, a service brake pedal operated by the right foot, an emergency brake actuated by a hand lever with a ratchet lock, a foot accelerator, and ignition and fuel throttle levers mounted on a quadrant on the steering column below the wheel. The steering gear is an irreversible type that is easily adjustable for wear and the 16-inch wheel makes steering very easy. The speed changes are by a hand lever that is operated in an H slot. The service brake is external contracting on the drums of the rear wheels, and the emergency brake is internal expanding within the same drums. Both brakes are equalized and there is minimized danger from skidding.

The touring car and the roadster bodies are of the so-called English type, being roomy and comfortable, of sheet metal with substantial wood frames. The windshields are incorporated into the bodies and there is no possibility of this equipment becoming loose and causing annoyance and excessive wear and noise. The forward doors are 18 inches width, and the rear doors 18.75 inches width. The width of the front and rear seats is respectively 18 and 19.5 inches. The lengths of the front and rear seats are 38.5 and 43.5 inches. The bodies are made with a tool box under the rear seat and pockets in all four doors. With the roadster there is locker space under the seat. The fuel tank capacity is 10 gallons, the tank being under the forward seat of the touring car, and is either back of the seat or under the seat of the runabouts, according to the type. The upholstery is of a high grade machine buffed leather with abundant hair padding and long springs for the seats and back cushions. The standard finish for the cars is with black hood and fenders, and red body with black band about the top, with black running gear with narrow red striping. The touring car is lighted by electric lamps from a six-volt 100 ampere-hour battery, with 16 candlepower head lamps, four candlepower dash lamps and two candlepower tail lamp, all controlled from the dash by push button switches. The hardware and the metal trimming of the car are nickel plated. The weight of the touring car is about 2000 pounds and the roadster weighs about 1800 pounds.

WILL NOT LOCATE IN KENTUCKY.

C. G. Stoddard of the Edwards Motor Car Company denies the report that this concern is to locate temporarily in the building formerly occupied by the Longest Bros. Company in Louisville, Ky. He adds that it expects to take temporary quarters in a building somewhere in the vicinity of New York, although this site has not be selected as yet. He characterizes the statement that his company eventually will take over the Simms Magneto Company as incorrect, as well as the suggestion that the Edwards plant probably will be located permanently in the vicinity of the Simms structure.

GRAMM FORMS PARTNERSHIP.

A partnership between B. A. Gramm, head of the Gramm Motor Truck Company, Lima, O., previous to its being taken over by John Willys, president of the Willys-Overland Company, and Max Bernstein, a business man of Lima, has been announced. The new company, it is stated, is to manufacture motor trucks exclusively. A tract of seven acres has been secured, on which several buildings will be erected.

CORRESPONDENCE WITH THE READER

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Eliminating Noise from Hoods.

(1400)—How can I stop the rattling of the hood on my car? It is a long one and the side clasps appear to be snug, but the hood rattles when going over rough places. Would a bonnet strap stop the noise?

E. W. MICHELSON.

Ithaca, N. Y., July 1.

A hood strap as suggested should eliminate the rattles referred to, but a better plan would be to

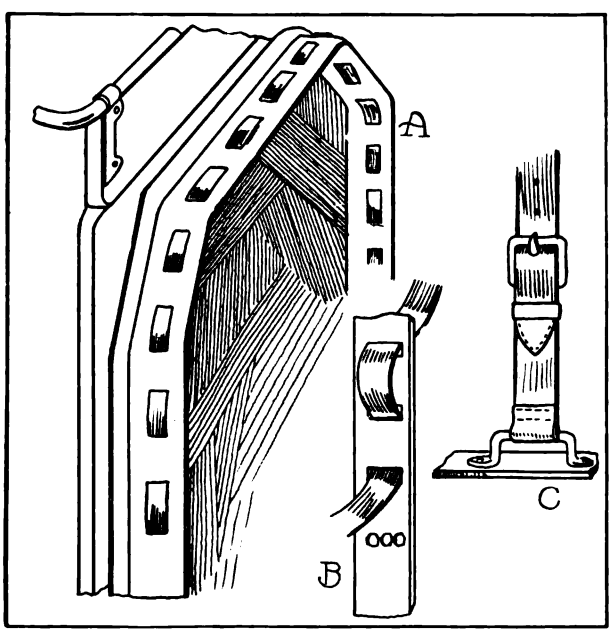

Fig. 1—Showing How a Noisy Hood May Be Quieted: A, Fitting Leather to the Hood Supports; B, How the Latter Are Prepared for the Material; C, Method of Installing Strap.

equip the dash and radiator supports of the hood with some anti-noiseless material, such as leather or rawhide. At Fig. 1 is outlined a method which has been utilized by many makers in the past. It consists of slotting the hood supports and weaving in belt lacing as depicted at A. At B is shown how the metal may be prepared for the leathers. Drill one or more small holes, then break out the edges with a small chisel, afterwards smoothing up the rough places with a file. The lacing is knotted at one end and inserted as outlined.

A hood strap could be applied easily and would not be very expensive. A handle, such as illustrated at C, which also depicts the fitting of the strap, is attached to each board supporting the hood, and to these are sewed the strap which is made in two sections. One is equipped with a buckle and the other perforated.

Should Be Satisfactory.

(1401)—I am investigating the merits of a certain make of touring car into which the following parts are installed. Six-cylinder Rutenber motor with 4.125-inch bore and 5.25-inch stroke, McCue full floating rear axle and drop forged front axle, F & S imported ball bearings, Bosch magneto, Warner multiple disc clutch and transmission, Spicer universal joints and Rayfield carburetor. Please be so kind as to inform me whether any better parts can be installed into a car than the above enumerated.

C. E. DOTY.

Dallas City, Ill., June 25.

An automobile containing the components outlined should give very satisfactory service as they are utilized in high grade machines, represent the result of years of experimentation in producing high quality parts, and enjoy an enviable reputation among manufacturers of motor cars.

Testing Spark Coils.

(1402)—Can you advise me of a simple method of testing a high-tension coil of the four-unit type without placing it on the machine and connecting up the spark plug and other wires? I am in doubt as to my coil as it was not working very well previous to my overhauling the car.

A CONSTANT READER.

Lancaster, Penn., June 27.

The coil may be tested without placing it upon the car and making the connections as stated. At Fig. 2 is presented a diagram showing a simple method of utilizing a battery, four wires, a spark plug and an ordinary monkey wrench. It will be noted that two wires are secured to the battery terminals, one to the positive and the other to the negative. The wire a is led to the battery terminal of the coil and the switch lever thrown to right to make a connection.

The other lead b is attached to the wrench which serves the same function as the frame of the car, that of a ground. The spark plug is next placed in the jaws of the wrench and the latter set, taking care that the terminal of the plug does not come within an inch or so of the metal of the tool. The secondary wire from the No. 1 coil is then led to and secured to the plug in the usual manner.

Digitized by Google

Next take a piece of wire and secure one end to the primary terminal of the No. 1 unit which is also connected through the secondary lead to the plug. The free end of the wire d is now touched to the wrench, completing a circuit, and if the vibrator is adjusted properly and the coil in good condition, a spark will be noted at the gap of the plug. Each unit may be tested in a similar manner.

It is important in conducting the experiment to make sure that a path for both the primary and secondary circuits is provided. That of the secondary is secured through the shell of the plug, wrench and ground wire to battery. Care should be exercised in testing any coil for if the spark is called upon to jump too large a gap, the windings are likely to be broken down in the operation. It should also be remembered that a spark loses much of its size when in a cylinder under compression and in testing a coil this must be taken into consideration.

Varnish for Copper.

(1403)—What is a good preparation to put on copper tubing to prevent oxidation? I note that the tubing on my machine corrodes as we are near the salt water during the summer. L. W. K.

Torrington, Conn., July 5.

A varnish for copper may be made by taking one part each of carbon disulphide, benzine, oil of turpentine, hard copal and two parts of methyl alcohol. Several coats of this material should be applied, allowing each to dry thoroughly before another application.

Home Made Blow-Out Patches.

(1404)—I have read somewhere that considerable service may be obtained from an old tire by fitting a smaller sized shoe inside. Is this a practical idea and how is it done? Also how are blow-out patches made from sections of old shoes?

INQUIRER.

Syracuse, N. Y., June 27.

The experiment has been tried with success by some owners, but the writer is of the opinion that the best method is to fit a new shoe which will be more satisfactory in the end. In selecting a shoe for the work, however, one in fairly good condition is best. The bead is cut off and the edges skived; that is, are cut slanting. Care must be exercised not to leave any sharp edges which might come in contact with the inner tube. If a larger liner is utilized a section may be cut out, taking care to make perfectly fitting ends. The real knack is to insert the inner tube so that it will not be pinched when the outside tire is being placed upon the rim.

Blow-out patches are made in a similar manner, skiving the edges of the section. It is advisable to reduce the thickness of the material by removing the rubber, so as to prevent undue strain on the inner tube. It is somewhat of a task to prepare these members, and as ready made patches are not expensive the writer suggests purchasing the latter.

Constant Leaking Radiator.

(1405)—For the past three months I have experienced considerable trouble with a leaky radiator. Have had it repaired several times by an expert but after replacing it on the machine it will leak after a short time. The tinsmith states that he tested the radiator under pressure and that something is wrong with its mounting. Can this be possible? JAMES McQUADE.

Harrisburg, Penn., June 25.

If the repair was thorough, as the tinsmith states, the trouble is due to the cooler being subjected to stresses and these may be caused by several things. It is possible that the leak may be due to the frame springing or becoming broken. The writer recalls a similar case where a removal of the side boards on the frame revealed a break which allowed the frame to compress the radiator supports. After welding the frame and repairing the leak, the trouble was eliminated.

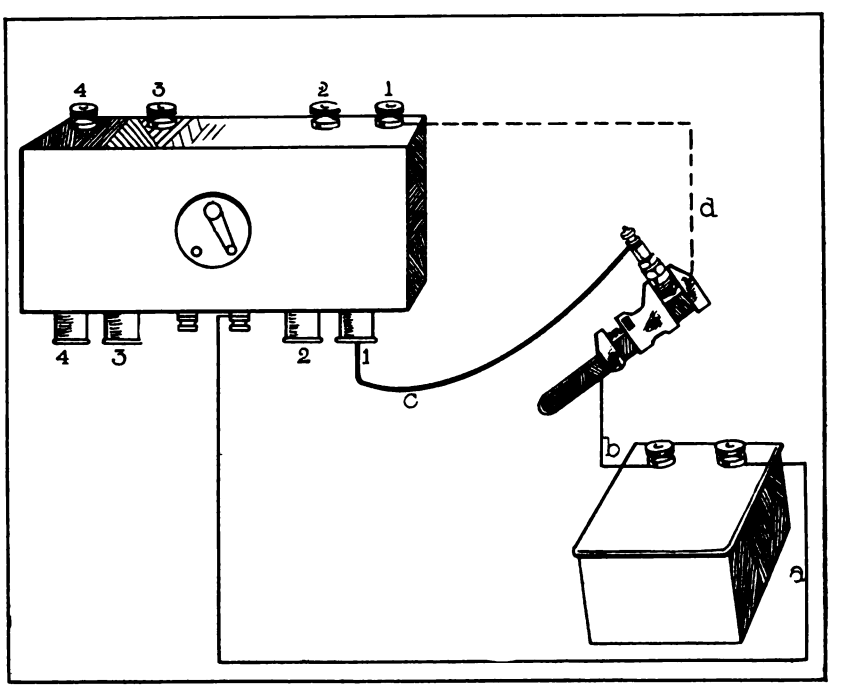

Fig. 2—A Simple Method of Testing Out a High-Tension Spark Coil Without Placing the Device upon the Car.

Examine carefully the frame and the radiator supports, also remove the cooler and test these members for any play. It may be possible that undue vibration is set up and if the radiator is supported at the bottom by a band and locked by studs, insert a strip of leather or similar material to counteract the vibration. This method has been known to end radiator troubles such as outlined.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

National Tour Routes.

Secretary-Treasurer G. B. Gibson of the Federation of American Motorcyclists, 24 Main street, Westboro, Mass., has mailed to every member of the federation a detailed routing of the four national tours to the convention in Columbus, O., July 17-21. Application blanks may be obtained from Dr. Gibson or from the various tourmasters, the names and addresses of which are given in connection with the following information:

Northeastern tour, from Albany, N. Y.; tourmaster, Fred S. Ellett, 224 Lormore street, Elmira, N. Y. —July 13, Albany, Schenectady, Amsterdam, Herkimer, Utica, Oneida and Syracuse, 158 miles; 14, Syracuse, Auburn, Geneva, Canandaigua, Rochester, Batavia and Buffalo, 150 miles; 15, Buffalo, Fredonia, Westfield, Erie, Conneaut, Ashtabula and Cleveland, 183 miles; 16, Cleveland, Medina, Wooster, Mt. Vernon and Newark, 123 miles; 17, Newark, Granville and Columbus, 30 miles.

Southeastern tour, from Baltimore, Md.; tourmaster, J. A. Robinson, 1810 West Mosher street, Baltimore—July 14, Baltimore, Ellicott City, Ridgeville, Frederick, Braddock, Middleton, Boonsboro, Hagerstown, Clear Spring, Indian Springs, Hancock and Cumberland, 138 miles; 15, Cumberland, Eckhart Mines, Frostburg, Grantville, Keyser, Addison, Uniontown, Brownsville, Beallsville, Washington and Wheeling, 132 miles; 16, Wheeling, Bridgeport, Cambridge and Zanesville, 72 miles; 17, Zanesville, Brownsville, Etna, Reynoldsville and Columbus, 55 miles.

Northwestern tour, from Chicago; tourmaster, J. A. Campbell, 1709 Fernwood avenue, Toledo, O.—July 15, Chicago, Hammond, Hobart, Valparaiso, La Porte, South Bend, Elkhart, Goshen, Churubusco and Fort Wayne, 182 miles; 16, Fort Wayne, Van Wert, Delphos, Lima, Wapakoneta, Sidney, Piqua, Troy, Vandalia and Springfield, 147 miles; 17, Springfield, Vienna, Summerford, West Jefferson and Columbus, 43 miles.

Southwestern tour, from Louisville, Ky.; tourmaster, E. G. Baker, 920 Hume-Mansuir building, Indianapolis, Ind.—July 15, Louisville, Jeffersonville, Salem, Bedford, Bloomington, Gosport, Martinsville and Indianapolis, 150 miles; 16, Indianapolis, Greenfield, Knightstown, Cambridge City, Richmond, Eaton, Dayton, Fairfield, Enon and Springfield, 145 miles; 17, Springfield, Vienna, Summerford, West Jefferson

Manufacturers' Annual Meeting.

The annual meeting of the Motorcycle Manufacturers' Association will be held in Detroit at the Hotel Cadillac in August, the meeting to be in conjunction with the sixth annual convention of the Cycle Trade Industries, which is to take place Aug. 6-9. Officers for the ensuing year will be chosen and it is expected several matters of importance will be considered. The programme for the big convention, of which the meeting of the motorcycle manufacturers is something of a side issue, is practically complete. Among several pleasure trips arranged for by the committee is a daylight and moonlight sail on Lake St. Clair and the Detroit river, a steamer having been chartered especially for the event. The committee has also planned a theatre party, the usual bowling contest and special entertainment for the women.

Perfect at Los Angeles.

Referee Charles Fuller Gates, who supervised the recent 550-mile endurance run of the Los Angeles Motorcycle Club of Los Angeles, Cal., has just announced the final revision of score sheets, which show that 22 of the 41 riders who started, finished, and 15 of these with perfect scores. The course was one of the most difficult and strenuous ever laid out in this country, and wound over 14 mountain passes, three deserts and nine rivers, and through 36 cities and towns. Paul Derkum, on an Indian, was the only professional to finish. He had a perfect score, and made the shortest time. Another remarkable performance was that by Erwin Knappe, who carried a tandem passenger, and finished perfect. The finishers, makes of machines they rode and their scores follow: R. D. Bissett, Excelsior, 1000; A. J. Menegay, Indian, 1000; W. C. Vaughn, Merkel, 1000; O. Bosshart, Indian, 1000; K. Verrill, Yale, 1000; C. Briggs, Excelsior, 1000; H. Shafer, Thor, 1000; W. S. Bryson, Merkel, 1000; F. Johnson, Excelsior, 1000; T. Johanson, Indian, 1000; J. Leonett, Indian, 1000; L. T. Clark, Indian, 1000; E. Knappe, Indian, 1000; G. L. Ledbetter, Indian, 1000; Charles Wride, Indian, 998; William Kuhn, Indian, 987; H. Lightcap, Thor, 955; Ray Little, Harley-Davidson, 950; F. E. Holdridge, Excelsior,

Lynn Club Active.

The Lynn Motorcycle Club of Lynn, Mass., recently enjoyed a run to Hampton Beach, N. H., where the members were entertained over Sunday by William Wiswell. An excellent dinner was served Sunday, following which the host and a number of others were called upon for speeches. The club is planning another run, this time to Essex, in the near future.

Swenson's New Home.

B. A. Swenson, Rhode Island agent for Indian motorcycles, has moved into his new business home at Broad, Blackstone and Friendship streets, Providence, R. I. This structure, which will be known as the Swenson building, is an able demonstration of what may be accomplished by proper business methods. Two views of the interior are shown herewith.

Some 12 years ago, when Swenson first started in business for himself, selling bicycles, he had very little capital but indomitable courage and a determination to succeed. He still handles bicycles, but it was when he began to sense the possibilities of the motorcycle that he laid the foundation stone for his future prosperity. It was by no means an easy task, since the general public was not ready to agree with him. How well he has succeeded is evidenced by the new building.

Two Views of the Interior of B. A. Swenson's New Indian Wigwam in Providence, R. I.—The Repair Shop Is in the Rear of This Salesroom.

The location is on one of the most prominent streets leading to the centre of the city, on the through route for tourists. That portion occupied by the motorcycle and motorcycle supply business comprises about half of the first floor, with the one-story addition in the rear, which is utilized as a repair shop and factory for the numerous Swenson specialties developed by him. The machines are neatly arranged through the centre of the salesroom and along the sides, while the surplus stock is carried in convenient racks in an adjoining room. The supplies, spare parts, etc., are arranged in drawers, carefully labelled. In fact, the whole plan shows admirable attention to detail.

The business undoubtedly is the oldest motorcycle and supply house in New England. Beside the main store in Providence, sub-agencies have been established in Wakefield and Westerly, R. I. July 1, still another Swenson venture was started in Pawtucket, R. I., when the Motorcycle Supply Company, Inc., opened for business at 73 East avenue. This concern has for its incorporators, B. A. Swenson, Edward Lutz and Clifford Frazer.

Indians Win Abroad.

In the recent Anglo-Scottish motorcycle team hill climb at Jedburgh, Scotland, Indian machines, made by the Hendee Manufacturing Company, Springfield, Mass., showed to exceptional advantage, providing the fastest time in the solo classes. In the larger class, A. H. Alexander rode an Indian over the .75-mile 12 per cent. grade stretch in 0:40. In the same event J. R. Alexander, riding an Indian, was timed in 0:48.2. A. H. Alexander made the fastest time for his team in the sidecar class, 0:72.8. The English team was a winner by 0:07.2. The winner was decided by totalling the time in seconds of the members of each team.

In the big reliability run of the Motor Cycling Club of London, recently held from London to Edinburgh and return, revised results of the scores show that Indian machines, made by the Hendee Manufacturing Company, Springfield, Mass., won as follows: Clark Cup—T. G. Proctor (sidecar), third; London-Edinburgh, gold medals—E. Gwynne; P. G. E. James and W. H. Wells (sidecar); London-Edinburgh and return, gold medals—H. E. Hull; B. A. Hill and T. G. Proctor (sidecar).

Another Tandem Seat.

A new tandem side seat which will doubtless find favor with women who prefer to sit sidewise was re-

Digitized by Google

cently introduced by Boen Bros., 54 South street, Utica, N. Y. The design is such that the weight of the rider comes directly over the rear axle, which is claimed to give improved balance. The seat measures 12.5 by 20 inches, is upholstered in leather and has a nickel plated hand rail around the side and rear. It has several four-inch springs which, combined with a pneumatic action, makes it independent of the springs of the motorcycle to absorb all the shock and jar. A guard protects the rider from the rear wheel.

Champaign Club Reorganized.

The Champaign Motorcycle Club was recently reorganized at Urbana, O., and has 30 active members. New and capable officers have been elected and the club plans for an active and progressive year. F. A. Harenberg, secretary, announces that the members will join the F. A. M. in a body. Among motorcyclists in other parts of the country who are actively engaged in organizing clubs might be mentioned C. P. Wyatt, Box 603, Albuquerque, N. M.; E. C. Brunkhorst, 228 Ohio street, Sedalia, Mo.; A. C. Wagner, Celina, O.

Moonlight Ride for Savannah.

The second annual moonlight ride of the Savannah Motorcycle Club of Savannah, Ga., was held recently. Over 500 members took part in the outing, for which a large steamer was especially chartered. Following a short run, machines were abandoned and a sail was taken down the harbor. Dinner was served on board, and a fine evening's entertainment was provided by members. Several weeks previous to the outing members advertised it in a unique manner by attaching long strips of yellow cloth to their machines, bearing an announcement of the event and its date.

Merkel Men Victorious.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel machines, calls attention to the fact that two of its mounts, ridden by Fred W. Mercer of Seattle and Ray E. Day of Tacoma, finished with perfect scores in the recent 404-mile endurance run held from Seattle, Wash. These men were the only amateurs to complete the test without penalization.

Indian Machine Stolen.

The Hendee Manufacturing Company, Springfield, Mass., maker of Indian mounts, has offered $100 reward for the recovery of an engine which was stolen from its twin-cylinder, seven horsepower Indian racing machine at the locker on the track at Philadelphia, Penn., last month.

Ocean-to-Ocean Relay Test.

An ocean-to-ocean motorcycle relay will probably attract the attention of motorcyclists a little later in the summer. The advantage of such an event is being called to the attention of clubs all over the country, and following the F. A. M. convention at Columbus, O., it is possible the event will be staged. The idea at present is to have a test, showing how fast a message, say in the War Department, could be relayed from San Francisco to New York by motorcycle messengers. The plan would be to have the relays from 50 to 100 miles and to have three men in each relay so that if one were delayed the others could continue with the message. If the event takes place, the route would be mapped so that the greatest possible speed could be maintained.

Mr. and Mrs. Leroy Snodgrass of Los Angeles Cal., and Their Sidecar Attachment.

Erie Club's Annual Parade.

The second annual motorcycle parade under the auspices of the Erie Motorcycle Club, Erie, Penn., was held recently, the affair proving the biggest success of its kind in the club's history. About 200 riders, with lamps aglow and machines decorated with streamers and banners, paraded through the principal streets of the city in single file, announcing their approach by the blowing of horns and ringing of bells.

ATTENTION MOTORCYCLISTS

Immediate deliveries of 1912 Indians, any Model. Cash or installment. Full line of equipments and supplies, also clothing for the Motorcyclist.

At the recent hill climb conducted by the Cincinnati Automobile Dealers' Association, two motorcycle events were included in the programme. Vernon Jones on a Merkel won the 30.50 cubic inch class.

Constant Secures New Record.

In the one-hour championship motorcycle race at the state fair grounds in Detroit recently, J. U. Constant of Brooklyn, N. Y., established what is declared to be a world's record for a dirt track, covering 66.625 miles. The previous record of 61.5 miles was held by Fred Huyck of Chicago. Constant's best time was 0:53.4.

Worcester Club Incorporated.

Agreement of association has been filed with the commissioners of corporation in Massachusetts by the Worcester Motorcycle Club as a social body, interested in the development and extended use of motor vehicles. The club has been in existence for several years and has had its headquarters and clubhouse at 92 Stafford street. The officers are: President, Harry S. Cutting; vice president, Charles E. Braman; treasurer, William H. Tannebring; secretary, Munroe S. Ripley; board of governors, Roger H. Christy, Russell R. Coes, Howard L. Clark, Ira C. Coombs and Charles H. Adams.

One Corner of the Testing Department of the Emblem Manufacturing Company's Plant at Angola, N. Y.

Will Manage Newark Track.

Paul Derkum of Los Angeles, Cal., one of the best known racing men in the country has signed to manage the new motordrome, recently completed at Newark, N. J. Derkum had planned to spend the summer in the East, and the managers of the new race track feel highly pleased to secure the services of a man so well known to the riders and the racing game. The new ellipse is located on South Orange avenue in the Electric Park amusement corral, directly opposite the Newark bicycle track. New York automobile men and Newark brewing interests are backing the project.

Club Notes, Here and There.

The Chicago Motorcycle Club is to hold a reliability contest for factory teams only, July 29-Aug. 3. The run will be 1200 miles for a $500 trophy.

The 15-day tour of the Short Grass Motorcycle Club will start from Pratt, Kan., Aug. 17.

Riders from Chicago, Milwaukee and other places competed in the eight racing events under the auspices of the Appleton Motorcycle Club at Appleton, Wis., recently. The contests were held on the dirt track at the fair grounds.

The Buffalo Motorcycle Club has completed arrangements for holding runs every Sunday for the balance of the season and plans are being made for an endurance run on Labor Day. Other events, not yet decided upon, may be held during the summer.

George V. Gove is the leading spirit in a movement to form a club of the motorcycle riders in Brockton, Mass., and vicinity. If enthusiasm enough can be aroused to make the organization a permanent one, affiliation with the F. A. M. will be sought.

Members of the Sandusky Motorcycle Club of Sandusky, O., recently took a three days' run to Buffalo, N. Y., and return. The club members left in a body July 4 and returned on the 7th, approximately 500 miles having been covered.

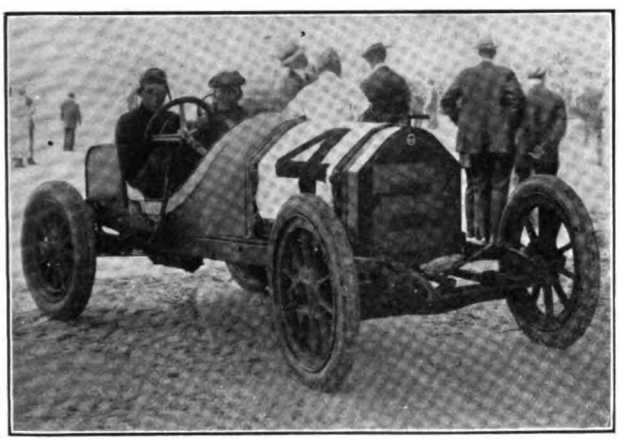
Gus Habich, a popular motorcycle dealer in Indianapolis, Ind., held his annual free-for-all motorcycle run and picnic, June 30, a large number of riders from that city and vicinity grasping the opportunity to participate in an enjoyable day's outing. Athletic events provided an interesting part of the programme.

The Columbia Motorcycle Club of Columbia, S. C., held its first F. A. M. meet July 4. The list included five events, run on a mile track, the feature being the 50-mile race.

Members of the Atlantic City, N. J., Motorcycle Club are urging the many new riders to join the F. A. M. The club recently had a run to Philadelphia.

The San Jose, Cal., Motorcycle Club recently voted to affiliate with the F. A. M.

Excelsior Wins Hill Climb.



Joseph Wanstradt, riding an Excelsior mount, made the quickest time in the hill climbing contest at Cincinnati recently, when he covered the half-mile course, which was laid on a 15 per cent. grade with one turn, in 0:29.8 in the 61 class. Running a close second was C. S. Schwarm, Indian, who was clocked in 0:30. Vernon Jones won the 30.50 event by negotiating the hill in 0:39.

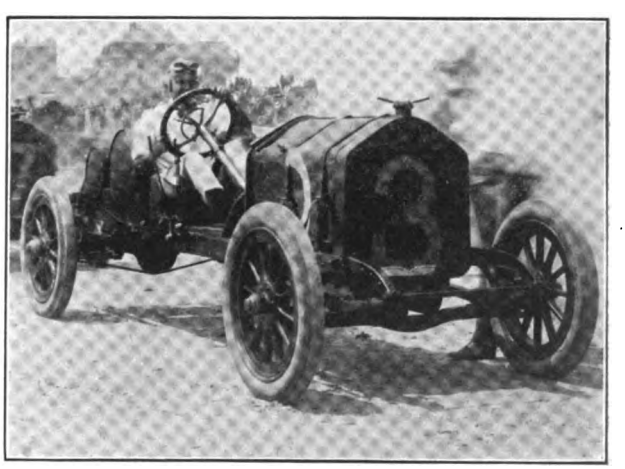
STUTZ AT OLD ORCHARD BEACH.

Takes Two Long Distance Events and Creates New Record---Schacht and Mercer Also Prominent Winners---Second Annual Meet a Splendid Success.

STUTZ drivers, John LeCain and David Lewis, easily proved the features of the second annual beach meet at Old Orchard, Me., July 4-6. It was the same car which won the 75-mile event of the first day and

John LeCain at Wheel of Stutz Car Which Won Two Long Distance Events at Old Orchard Beach Meet.

the 100-mile contest of the last, but the two drivers named divided the honors. Incidentally, it may be added that the Stutz created a new record for the distance over this course.

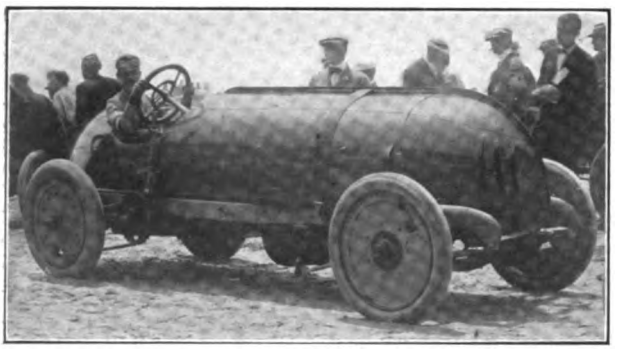


It should not be forgotten, however, that William Endicott in a Schacht secured first place in one 100-mile event, exceeding all previous marks for the distance on this speedway, which is now regarded as second alone to the Daytona beach course in Florida. In fact, nearly every one of the races on the three-day programme offered some exceptionally fine driving.

While from a racing standpoint the meet was a grand success, it must be added that the Old Orchard Automobile Association lost money. Over 50,000 people witnessed the various contests, but unfortunately the beach is so located that spectators may obtain quite as good view of the course from the roadway, and many declined to pay the admission fee. For two miles the beach was screened off by canvas, but at such height that those standing in vehicles or on porches could look over it. As a result it was voted unanimously by the association at its meeting July 6 to abandon the admission charge another year. It is estimated that the two years of racing at Old Orchard have made it evident that the beach is one of the best in the world, and that next year even larger crowds will visit the hotels during the meet, particularly when it is made known that no admission fee will be required. There also is some discussion as to the advisability of holding another meet here, Labor Day. Detailed announcement will be made later.

Records began to fall with the opening event, when Louis Disbrow drove the Jay Eye See, a special racing car, a mile from a flying start in 0:35.1, lowering the mark of 0:39.8, set last year by L. F. N. Baldwin in a Stanley steam car. While other attempts were made later in the meet, Disbrow's mark still stands. This is all the more remarkable, inasmuch as the course was somewhat uneven, a condition which was eliminated during the last day.

Many of the shorter events were spiritedly contested, but naturally the most interest attached to the long distance races. Could it have been possible to have eliminated the turns, much faster time would have resulted in these. The straightaways were covered at record speed, but the drivers always were forced to slow down at the two turns, with the only other alternative of running into the water.



In the 75-mile race of the first day, which was to have been for 100 miles, but was cut down on account of the rising tide, nine prominent drivers took part as follows: Harry Grant, Berkshire; John Rutherford and Neil Whalen, Nationals; William Endicott, Schacht; Joseph Matson and Robert Stuart, Fiats; Charles Basle, Bianchi; L. F. Hersey, Chadwick, and John LeCain, Stutz. Matson took the lead at the first turn, followed closely by LeCain and Whalen. On the third lap, Endicott moved up, while Matson went out on the fifth. LeCain took the lead at this point and was not headed. At the end of 25 miles, Grant

John Rutherford and the National Car, a Prominent Winner in Second Old Orchard Beach Meet.

was in third place, and took the second at 60. Both he and Whalen were driving strong when the race was called, with the Stutz a winner.

Digitized by Google

Louis Disbrow's Special Jay Eye See Racing Machine Which Lowered Baldwin's Steam Car Mile Record.

Two more long distance events were held the second day. In the 50-mile race, the contest easily was between Joseph Nikrent in a Case and Alfred Hummell in a Mercer. Nikrent was in the lead until the end of the 49th mile, when Hummell, who had been giving a splendid exhibition of consistent driving, passed him a winner.

In the 100-mile race, William Endicott in a Schacht created a new course record. It was a hard fight, however. Almost from the very beginning of the race, John Rutherford, who created a beach mark with his National at Old Orchard last year was in the lead. Endicott held the second place in like manner. It was on the 99th mile that Rutherford lost the contest, Endicott being less than 20 feet behind him when his car was forced to stop for an instant. As it was the National was less than nine seconds behind the winner at the end.

Practically four minutes were clipped from the Schacht record in the 100-mile race of the last day, in which David Lewis sent the Stutz over the finish line in first place. Six cars competed in this event. Endicott experienced tire trouble at the very beginning, and the manner in which he attempted to make up lost time won him much applause from the crowd. He passed car after car, going under the pier so fast that many of the spectators held their breath.

Lewis was in second place at the start. When Endicott stopped at the end of five miles, he took the lead, and was not headed. Whalen in a National was then in second place, with Basle in a Bianchi, Cobe in a Jackson and Grant in a Berkshire behind him. While Endicott was overtaking the field, Grant was just as earnestly striving to close up the gap between him and first place. At the end Endicott was in second place and Grant in fourth. Whalen was in third. During the last 40 miles, Lewis seemed to realize the necessity for urging his Stutz, and the finish was one of the most exciting bursts of speed that has been seen in an American race. It developed at the conclusion that Grant had driven the entire event with but one ring in the first cylinder.

The summary of the meet follows:

THURSDAY, JULY 4.

One Mile, Time Trials.

Car	Driver	Time
Jay Eye See,	Disbrow	0:35.1
National,	Rutherford	0:47.0
National,	Whalen	0:47.5

STUTZ

WHY does the Stutz go on winning in practically every race it enters?

WHY is it that when the Stutz enters a race the highest priced cars in the world have to look to their laurels?

WHY the consistency of the Stutz?

WHY is it that the Stutz factory runs full capacity all the year round?

WHY are the motor wise looking on the Stutz with such favor and endorsing it in the most unqualified terms of praise?

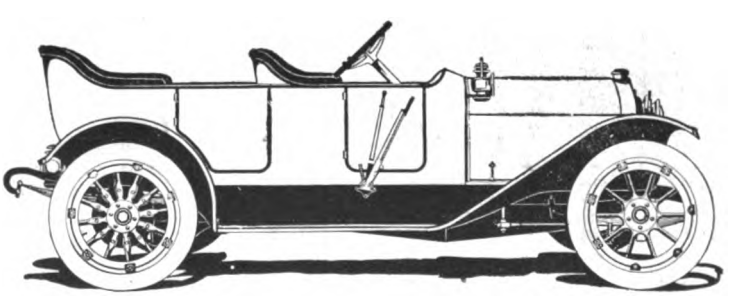
There is but one answer:---BECAUSE THE STUTZ IS REALLY A GOOD CAR.

In the one year of its existence, the Stutz has been a consistent winner in almost every race in which it has been entered. The first Stutz ever built was constructed from the blue prints up in five weeks and went through the first 500-mile race without a single mechanical adjustment. Successive Stutz cars have not departed from the construction of this first Stutz radically.

In the last 500-mile race the Stutz finished 4th and 6th. The 3rd Stutz entry was running beautifully when a blown tire threw it off the track. Neither of the three entries suffered any mechanical difficulties. The extreme smallness of the cars, as compared with some of the entries made their showing nothing short of spectacular. Note that the Stutz also won—

Bakersfield, Calif., February 22nd, 1912—Bakersfield Road Race, Lakeview Trophy Cup, Taft Cup.
San Jose, Calif., March 17th, 1912—Five-Mile Match Race Free-for-All.
Santa Monica, Calif., May 4th, 1912—Stutz finished 4th and 5th.
San Francisco, Calif., May 16th, 1912—Broke Sacramento to Folsom record.
San Francisco, Calif., May 21st, 1912—Broke Sacramento-Stockton round trip record.
Sacramento, Calif., June 2nd, 1912—Stutz won everything in two-days' track meet.
Salem, N. H., June 8th, 1912—Fifty-Mile race at Rockingham Park, N. H.
Old Orchard, Maine, July 4th, 1912—One Hundred-Mile Race.
Tacoma, Wash., July 5th, 1912—One Hundred-Fifty-Mile Class Race.
Old Orchard, Maine, July 6th, 1912—One Hundred-Mile Free-for-All.

You will never want a car that will go 500 miles at a sustained terrific speed, but it is a great satisfaction to know that you have a car which could endure the test if it had to.



And the Stutz sells for the reasonable price of $2,000. See our nearest dealer for a demonstration.

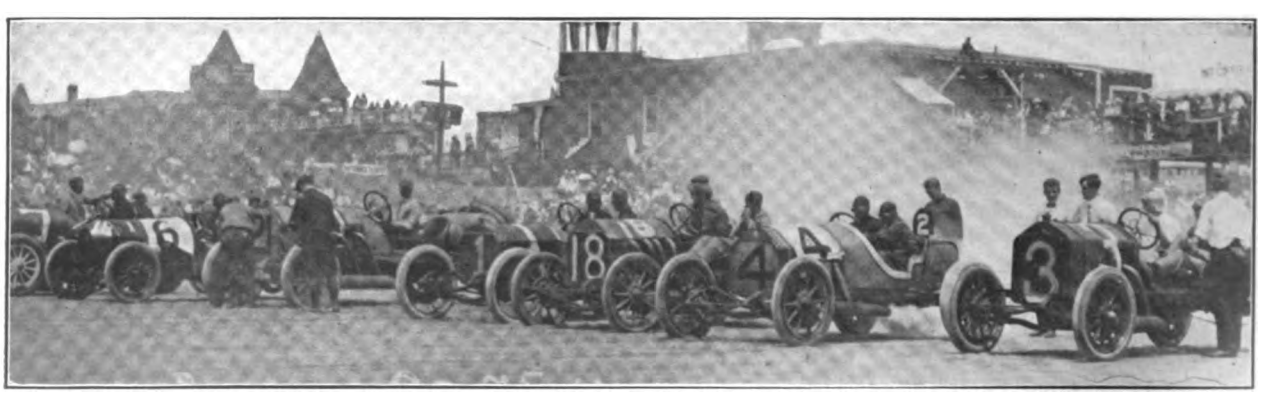
"FAST LIMITED" AUTOSUIT.

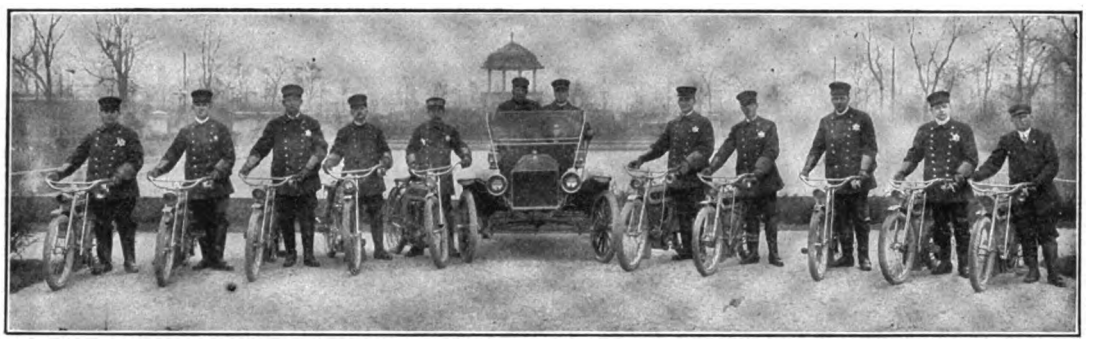
The driver or the man who cares for his own car no doubt has had such experience as will cause him to appreciate any form of practical protection for his clothing while working about his machine, and because of the possibility of being compelled to make a repair or adjustment at any time, either on the road or in the garage, it is desirable for every man who tours to provide what will adequately shield his garments from soil. The old dust coat may be used, but every motorist knows the annoyance of the loose sleeves and skirt of the duster, which will either work up the arms or catch on the mechanism and expose the cuffs and coat sleeves, or will not effectually prevent the trousers coming in contact with dusty or oily parts. If it is necessary to work under the car the coat is in every way insufficient, and the overall and jumper will always separate at the waist when the wearer is writhing about on his back and cause his clothing to soil from the road dust or the garage floor.



The "Fast Limited" autosuit, made by the Detroit Overall Company, Detroit, is a one-piece garment of heavy pin check denim that may be slipped on over a suit and buttoned snugly, so that the motorist is protected fully, no matter what may be the work. It is closed tightly at the collar and wrists, and being of light weight, makes for decided comfort. There are four pockets in which tools may be carried. It is made with the deep continuous side and relieves the shoulders from the strain of the suspenders and in any position it is a complete protection. When it becomes soiled it may be washed and will be restored to its original appearance. It may be rolled and carried in any convenient place.

The "Fast Limited" Autosuit.

DEATH OF A. W. HARRIS.



The industry will be deeply grieved to learn of the death of A. Walter Harris, head of the A. W. Harris Oil Company, Providence, R. I., in that city, June 30. Mr. Harris may be regarded as one of the pioneer oil men of the industry; in fact, the A. W. Harris Oil Company was organized some 28 years ago and was engaged in the production of cylinder oils for steam engines and other purposes long before the practicability of the automobile was considered as established. It may be added that the business of the concern will be continued as in the past, Mr. Harris' associates assuming the burdens laid down by him.

Line-Up for the 100-Mile Race, the Last Event of the Meet, in Which David Lewis Drove the Stutz for Its Second Big Victory.

Police Captains Don't Guess!

Capt. Stiles and ten of his men.

They Know Their Speed and Yours!

Police Departments make it their business to use Speedometers that are absolutely and unerringly accurate---instruments capable of giving real testimony in Court. We reproduce herewith an unsolicited letter from Captain Stiles of the Chicago Police. We offer this as additional and undeniable evidence regarding the absolute accuracy of the JONES.

WEST CHICAGO PARK COMMISSIONERS.
Department of Police.
A. J. Stiles, Captain.

Chicago, June 21, 1912.

Jones Speedometer, Chicago, Ill.

Gentlemen: It is with great satisfaction that I have at last found a Speedometer that has proven under all kinds of tests to be almost absolutely perfect. I have tried all other Speedometers and was compelled to discard them as they would not stand a test for accuracy, or, in other words, were merely a guess. In using the Jones Speedometers in my Department, I can conscientiously say that we have found no condition and under no circumstances the Jones Speedometer to be wrong.

Inasmuch as we are making a great many arrests for the violation of the State Vehicle Law, and with a disposition to be fair, I say again that it was a great consolation that we have found a Speedometer that we can depend upon. These Speedometers I test every day under a Stop-watch and with a very few exceptions they are always accurate.

Yours very truly, ARTHUR J. STILES, Captain.
West Park. Police Dept.

Avoid unwarranted arrest for speeding by using the same Speedometer as the Police. Your testimony will then be as unimpeachable as theirs. You take no chances. The JONES is constructed on the principle of centrifugal force. It is unimpervious to temperature changes. Remember:---The Police in all the larger cities of America and Europe USE THE JONES. Better get in line. Ask your dealer and get your JONES today!

THE JONES SPEEDOMETER

Factory: NEW ROCHELLE, N. Y.

Chicago, Boston, Philadelphia, San Francisco, Buffalo, Los Angeles, Portland, Seattle, Detroit.

ALFRED N. MAYO DEAD.

Alfred Nye Mayo, one of the prominent figures in the automobile industry for a number of years, and treasurer of the Fisk Rubber Company, Chicopee Falls, Mass., died June 26. The loss is one which will be felt keenly, not only by the maker of Fisk tires, but by all those connected with the manufacture of cars and fittings. He was a man who made many friends and his advice on matters affecting the welfare of the industry was much sought after.

PHILADELPHIA'S TRUCK PARADE.

Five hundred and nine commercial vehicles were in line during the second annual motor truck parade in Philadelphia, under the auspices of the Philadelphia Inquirer last month. In 1911 there were something like 235 cars on view. This would seem to indicate that the use of the mechanical transport in the City of Brotherly Love was rapidly increasing.

Much credit is due the Philadelphia Inquirer for the successful outcome of its undertaking, in which it has aided the industry materially in bringing the practicability of the motor truck to the business people of the city. Five divisions were required to accommodate the entrants, these being divided as follows: First, cars of over 7000 pounds capacity; second, 4000-6900 pounds; third, 2100-3000; fourth, less than 2000; fifth, electrics. The parade occupied more than an hour in passing a given point.

ROCKINGHAM PARK PLANS.

The success which attended the opening automobile race meet at Rockingham Park, Salem, N. H., June 8, has made it evident that the people of New England and the East are interested in contests of this character and that they will support such events when conducted under proper management. In view of this situation plans are under way for another big meet scheduled for Oct. 12. A number of events will be staged, opportunity being given for both amateur and professional drivers to compete for substantial prizes. The chief award will be for the 50-mile race. Complete arrangements are in the hands of James F. Kerr, 67 Milk street, Boston, Mass., to whom all communications requesting information should be addressed. The entry blanks will be issued within the next two weeks, and further particulars will be announced shortly.

RESULTS AT TACOMA.

According to dispatches from Tacoma, Wash., Teddy Tetzlaff in his Fiat was a winner in two of three long distance road events held there July 5-6. Lee Cooper in a Stutz won the third. Ralph Mulford in a Knox appears to have made some exceptionally fast time during the 200-mile event, driving five miles in 3:55 at one period. It ought to be said in connection with the summary below, that four races of 100, 150, 200 and 250 miles, respectively, were scheduled to be run on these dates. The dispatches make no mention of the 100-mile event, and seem to have substituted a 500-mile race for that of 250 miles. No time is given in this contest, and the situation will need subsequent explanation. The results:

Philadelphia Inquirer's Commercial Vehicle Demonstration Coming Down Street in That City.

The NATIONAL STARTER

Securely Founded Upon Right Principles

OF ALL types of starters today on the market none is more simple and direct in its action than the **National.** Dependent upon no other source of energy than that derived from a simple pressure of the foot it is free from all the trouble connected with starters operating on the acetylene gas, electric, compressed air and spring principle. It is built on a trouble-proof, mechanical principle, the efficiency of which has been proved in actual test 100 per cent perfect.

In point of safety the **National** proffers to motorists not only all the security of starting from the seat, but also the insurance against the dangers which of necessity are connected with starters which operate on an explosive principle. You will never blow out a cylinder head or set your car on fire if your starter is a **National.**

Certainty of starting is the **NATIONAL** watchword—100 times out of 100 today, tomorrow, and 5 years from now. Its efficiency is flawless—100% perfect. It will start your car regardless of whether your gas tank is empty or full, your storage batteries fresh or exhausted. You don't have to tinker with a switch, a pump, a handle or a gas distributor *before* you start. One operation—that of simply pressing the dash pedal—is all sufficient to get any car under way at any time.

NATIONAL ECONOMY exhibits itself to the motorist by an absence of upkeep expense and repair bills. *There are no charges for gas or electricity.* It costs nothing to operate a **NATIONAL.** It never requires the services of a mechanic to make it work. It never necessitates having the motor decarbonized. ¶ No bills accumulate on these scores—you pay for your **NATIONAL** but *once.*

The Starter Complete, attached to car, $50.

K-R-I-T

Model "K" Touring Car, Fully Equipped—$900

Equipment includes three oil lamps, two gas lamps, generator, mohair top with side curtains and top cover, windshield, horn, demountable rims with spare rim, tool kit with jack and tire repair outfit with pump.

The K-r-i-t is always a new car

One of the main elements of the extraordinary K-r-i-t value is the fact that the K-r-i-t is always a new car.

We employ an efficient corps of engineers and designers to devise improvements and refinements.

We install these improvements and refinements as rapidly as our engineers develop them, instead of holding them back for introduction on the next year's model.

So the K-r-i-t owner, at the beginning of a so-called "new season," as at all other times, finds himself with a car in which the latest practical ideas have already been incorporated.

The K-r-i-t car—every K-r-i-t car—has been brought up to the current moment in the motor car industry.

We announce no sensational new model because every K-r-i-t car is new.

This policy is as old as the Krit Company.

We adopted it at the outset because we believe the buyer is entitled to the most modern in design, construction, or progress—no matter when he purchases his car.

Because of this policy we make no "new season" announcements; and will make none this year.

And because of this policy, the purchaser of any K-r-i-t, at any time, is assured of getting a car that embodies the latest and best in engineering practice and in design.

Where the K-r-i-t gets its extraordinary power, extreme durability and long life

The K-r-i-t's reputation for staunchness and extreme durability is not confined to a few isolated communities, as you probably have learned.

It is as wide as the nation; and the rougher the country, the more difficult the roads---the more firmly the K-r-i-t is established as the medium-priced car that has made good.

The chief of the reasons for this is, of course, the structural quality of the car.

But back of this, and overshadowing in importance every other consideration, lies the fact that every part essential to smooth running, long life, economy and comfort, is produced by and within the K-r-i-t organization.

In other words, the K-r-i-t at $900 is a manufactured car in a sense as binding and literal as the term implies when applied to the $4000 or $5000 car.

You see how this process of manufacturing, instead of buying parts ready-made and assembling them, saves money for the manufacturer.

And the saving, in this instance---in the shape of better materials, more careful workmanship, better operative qualities---goes into the K-r-i-t and makes it a vastly better value than the average $900 car.

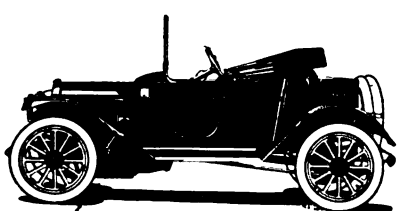
We not only design the motor---we make it; cast the cylinders in one piece to give rigidity and preserve alignment; equip it with ball bearings and with connecting rod bearings 50 per cent larger than usual, to promote smooth running, silence and the greater development of power.

We make the clutch of multiple discs---a clutch that holds, and holds, and holds in sand and mud and on the hills; and yet starts the car as smoothly and easily as an electric glides away.

We make the transmission and rear axle, cut the gears from chrome nickel steel---the hardest and costliest metal known---and mount them on ball bearings.

We drop forge the front axle, thus assuring strength and stability in a most important member.

We make the transmission drive shaft of chrome vanadium steel, and specially heat-treat it for toughness and strength.



Turning to the factor of comfort, you find the touring car amply roomy for five grown persons---and equipped with full elliptic rear springs, another unusual feature for $900 to $1000 cars.

At almost every point throughout the K-r-i-t you encounter a value-fact that you have not found in other cars of the K-r-i-t price.

To be sure, you may succeed in getting one, or even several, of the K-r-i-t features in some other car of equal price.

But you can't get them all in any car save the K-r-i-t.

Confirm this by a visit to your nearest K-r-i-t dealer; or write for the catalog.

Model "KR" Roadster, Completely Equipped—$900

This car was introduced last January; and the demand which it immediately developed was so great that we are not yet abreast of our orders.

If you could see your differential work you'd be mighty careful of its lubrication

IF we could see the actual workings of the human heart, we would swear off smoking and cut out heart weakening habits.

Not seeing, we make mistakes. But nature, the great compensator and adjuster counteracts our blunders.

If you could see the actual service working of the differential of your car, you'd be filled with wonder and alarm.

You'd never neglect its lubrication, or consciously use a poor lubricant.

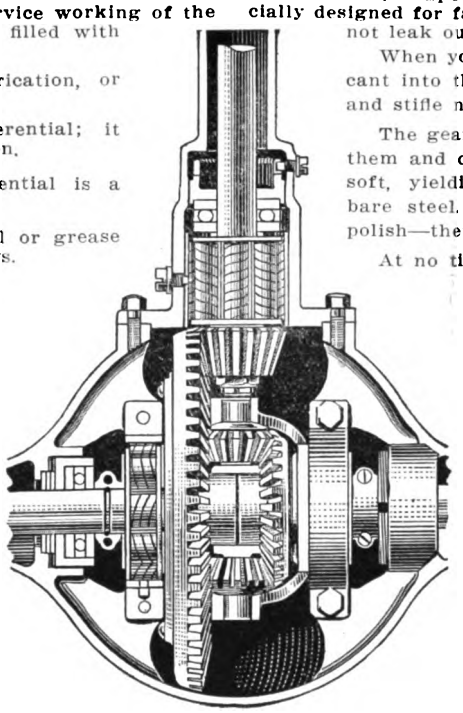
Nature doesn't help a differential; it harms it in the guise of Friction.

Carelessly speaking, a differential is a conglomeration of cogs.

Carelessly considering, any oil or grease is a safe lubricant for a lot of cogs.

But accurately speaking, a differential represents the highest form of gear assembly with bevels, spurs and pinions, running on ball and roller bearings.

Its duty is severe—speed, load, direction, everything variable.



Each side of every tooth gets wear; the load is thrown on instantly, nine times out of ten from a standstill.

Perfect lubrication at any price is no extravagance in a differential.

It is a real economy to use the best lubricant you can buy.

Every tooth must be coated heavily with good bodied lubricant, not merely wet with oil or filmed with grease.

Keeping the teeth enveloped is only one duty of the lubricant; immersing the ball and roller bearings is another; remaining within the differential housing is another. The lubricant must not escape.

THE DIFFERENTIAL

Use "K-No. 000" Grade or "K-00 Special" Grade Non-Fluid Oil for your differential.

The K-No. 000 Grade is a fairly heavy bodied lubricant for use in differentials where the housing would allow a lighter lubricant to escape.

The K-No. 00 Special is a light bodied product especially designed for fairly oil tight housings. This will not leak out where ordinary oil would.

When you have put a supply of this lubricant into the housing, you snuff out friction and stifle noise.

The gear teeth pick it up and it clings to them and coats them. The gears mesh in a soft, yielding cushion—Steel never touches bare steel. The only wear is a slow oily polish—there is no rapid abrasion.

At no time, under hot weather conditions or hard steady drives, does Non-Fluid Oil melt. Nine grease lubricated differentials out of ten, leak, proving the melting of grease. All oil lubricated differentials leak. Often the lubricant follows the axle and makes its escape through the brake drums. The brakes slip, wheels are smeared and tires rot.

Non-Fluid Oil means a clean rear axle, and a perfectly lubricated differential. If you will inquire, you will find that worn out differential gears invariably accompany grease or oil lubrication.

With Non-Fluid Oil the differential outlasts the engine itself. Non-Fluid Oil is amazingly durable. The supply is depleted only by being actually rubbed out of existence by the gears.

The ball and roller bearings are kept bright and never become gum-bound as occurs with rancid grease. Pitting is impossible. Non-Fluid Oil is acidless.

If your gears show wear or make noise, or if your lubricant melts and leaks out, you had better alarm yourself into a trial of

All leading dealers handle Non-Fluid Oil. Ask your dealer, but insist upon the genuine.

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE **NON-FLUID OIL**

In purchasing Non-Fluid Oil be sure the can is orange colored and bears this trade mark.

We are not talking of an expensive innovation. The actual yearly outlay for Non-Fluid Oil is less than for any other lubricant.

Post yourself further on the differential. And then post us a request for a free sample of either grade. Paste the attached coupon on a postal. Mention the grade you desire.

READ THIS NEW BOOK "The Trail of the 'Bull Dog'"

By Chas. G. Percival, M. D.

DO YOU KNOW THAT THERE ARE PLACES IN THE U. S. THAT ARE SO OLD THAT EUROPE IS A CHILD BESIDE THEM?

Are You Aware That America Is Richer In Ruins By a 1000 Fold Than All Europe Combined?

Did You Ever Hear That These Ruins Belong To a Civilization Compared To Which The Oldest of Europe's Monuments Belong To But Yesterday?

Have You Visited The Innumerable Castles All Through The Great Southwest Where The Most Enlightened Race In the World Have Lived, Departed and Left No History Within The Knowledge of To-day?

This book which is new and original is by Chas. G. Percival, M. D. and contains the incidents of his two year's automobile trip into all parts of the North American Continent, 1500 miles in Mexico during the late insurrection, of being chased by bandits, being lost on the Desert and rescued from death by thirst by Troop K of the 4th U. S. Cavalry. Replete with 300 interesting original photographs by the author. Read how he penetrated a thousand miles farther north than ever before by auto, driving over the dreaded White Pass Trail from Skagway, Alaska, tidewater to the headwaters of the mighty Yukon River in the Klondyke and north of 62 degrees.

Look at the pictures of crossing the highest point of the Sierra Nevada and Rocky Mountains and crossing the continent from San Francisco to Portland, Maine, in the middle of winter in three feet of snow.

The most interesting and instructive book on America for Americans that has ever been printed.

Get it and learn about the Country You Live In.

PRICE 50 CENTS PREPAID.

You may not BUY good oil but you PAY for it just the same.

Yes, you pay for it in carbonized cylinders, in worn out piston rings and bearings, and finally in a ruined engine.

Isn't it better to get the best oil at the start and save repair bills later?

PANHARD OIL

Panhard Oil gives perfect lubrication with a minimum of carbon deposit. We can **explain** why if you wish, but why not **prove** it to yourself by a trial in your own engine? Then don't listen to the "just as good" man.

Look for the checkerboard mark on every Panhard package, both cans and barrels.

Write today for our new booklet, "Motor Lubrication." It contains valuable information as to the lubrication and general care of a car. Yours for the asking.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS---A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

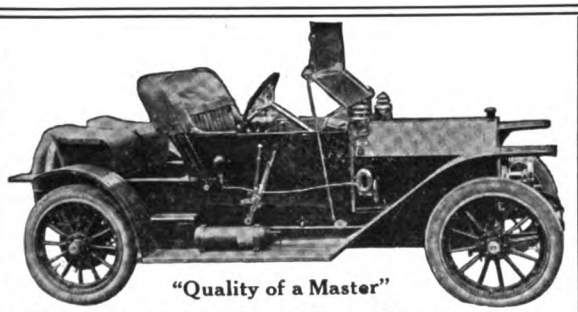
From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**



Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

NEWTONE

The Mile Away Electric
MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

CAREFUL DRIVERS USING SO-CALLED GUARANTEED MILEAGE TIRES HELP TO PAY FOR TIRES ABUSED BY RECKLESS DRIVING

Why Pay For Tires Abused By Others?

Did you ever stop to think, Mr. User of Mileage Guaranteed Tires, that while you are following out the letter and spirit of your agreement by careful driving, proper inflation, and no overloading, there are scores of drivers paying no attention to these details. Factory perfect

FRONTIER TIRES

are guaranteed absolutely against mechanical imperfections and to afford reasonable service under ordinary conditions. Immediate and amicable adjustment will be made where Frontier Tires fail to give satisfaction.

Frontier Tires are lower than their competitors. Ask for a price list and be convinced. Also be up-to-date on tire matters by constantly asking your dealer for the latest Frontier tire-treating tips.

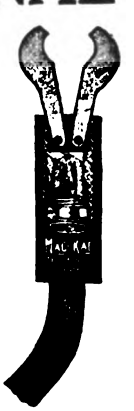
"Buy a Frontier Tire and Get a Long Run For Your Money"

FRONTIER TIRE & RUBBER COMPANY

General Offices, 1054 Main Street, Buffalo, N. Y.

UNIVERSAL TERMINAL

The Mac-Kae Universal Terminal fits *any* type of plug, either foreign or domestic.



Turn the threaded fibre sleeve and the jaws are firmly closed and simply *cannot work loose.*

By fully extending the jaws, this terminal will give secure contact on a plug through the top cap, if by accident the threaded post should be broken off.

You can remove the Mac-Kae Universal Terminal while the motor is running.

25c each at all dealers, or direct from us.

The Randall-Faichney Co.
Successors to
MAC-KAE MFG. CO.
BOSTON, MASS.
Mac-Kae Spark Plugs are best. $1 each.

Newcomb Carbureter

Designed to deliver and *does deliver* to the engine *a mixture correct under all operating conditions*—in contrast with carbureters provided with auxiliary spring controlled air inlets, which only approximately correct the mixture when wrong.

A Scientific Departure in Carbureter Construction

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

Classified Buyers' Guide

To facilitate selection in purchasing Motor Cars, Motorcycles, Accessories, Parts, Supplies, Fittings and Attachments, as well as Aviation Equipment, we present the following list of representative and progressive advertisers in our publications, addresses of their main and branch houses and the line of products handled by each.

ACCESSORY MANUFACTURERS AND JOBBERS.

Bi-Motor Equipment Co., 177-179 Portland St., Boston, Mass.
Branch: 113 Massachusetts Ave., Boston.

Caldwell Mfg. Co., 1756 Cranston St., Providence, R. I.

Hawthorne Mfg. Co., 29 Spruce St., Bridgeport, Conn.

Hopewell Brothers, Newton, Mass.
Branch: 1974 Broadway at 67th St., New York.

Miller, Chas. E., 97-103 Reade St., New York.
Branches: 202-204 Columbus Ave., Boston; Bridge and Dwight streets, Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland; 227 Jefferson St., Detroit; 66 Edgewood Ave., Atlanta, Ga.; 601-603 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.

Milwaukee Auto Specialty Co., 128 Second St., Milwaukee, Wis.

Waite Auto Supply Co., 81 Exchange place, Providence.

ACETYLENE TANKS, (See Tanks.)

AIR COMPRESSORS AND TANKS.

Williams Foundry & Machine Co., Akron, O.

AUTOMOBILES. (See Cars.)

BALLS AND BALL BEARINGS.

Boyd, F. Shirley, 903 Boylston St., Boston. (R. I. V.)

Bretz Co., J. S., 250 W. 54th St., New York. (F. & S.)

New Departure Mfg. Co., Bristol, Conn.

BATTERIES.

Geiszler Bros. Storage Battery Co., 514 W. 57th St., New York.

Lincoln Electric Co., 1007 Atlantic Ave., Brooklyn, N. Y. (Hi-Po Waterproof Dry.)

Waite Auto Supply Co., 81 Exchange place, Providence. (Success.)

Willard Storage Battery Co., 5716 Euclid Ave., Cleveland. (L B A.)

BLOW-OUT PATCHES. (See Patches.)

BODIES—WOOD AND METAL.

Springfield Metal Body Co., 20 Medford Ave., Springfield, Mass.

BODIES, TRUCK.

Lynch Manufacturing Co., Hammond, Ind.
Branches: East Chicago, Ind.; South Chicago, Ill.

Motor Truck Body Co., 320 Franklin St., Detroit.

BRAKE BANDING OR LINING.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Raybestos.)

Standard Woven Fabric Co., Worcester, Mass. (Multibestos.)
Branches: 903 Boylston St., Boston; 237 Lafayette St., New York.

BRAKES.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Duplex.)

BRUSHES, WIRE.

Williams Foundry & Machine Co., Akron, O.

BUMPERS AND FENDERS.

Sager Co., J. H., 271 South Ave., Rochester, N. Y. (Diamond.)

CARBURETORS.

Sumner, George, Inc., 1841 Broadway, New York; 755 Boylston St., Boston. (Rayfield.)

CARS—GASOLINE PLEASURE.

Atlas Motor Car Co., 104 Birnie Ave., Springfield, Mass. (Atlas-Knight.)
Branch: N. E. Corner Broadway and 64th St., New York.

Berkshire Motors Co., Cambridge, Mass. (Berkshire.)

Brush Runabout Co., 3 West 61st St., New York. (Brush runabout. Liberty-Brush.)

Buckeye Manufacturing Co., Anderson, Ind. (Lambert.)

Cartercar Co., Pontiac, Mich. (Cartercar.)

Clarke-Carter Automobile Co., Jackson, Mich. (Cutting.)

Cole Motor Car Co., See Henderson Motor Sales Co.

Columbia Motor Car Co., 3 West 61st St., New York. (Columbia.)

Dayton Motor Car Co., 3 West 61st St., New York. (Stoddard-Dayton.)

Haynes Automobile Co., 166 Main St., Kokomo, Ind. (Haynes.)

Henderson Motor Sales Co., Indianapolis. (Cole.)
Eastern Distributors. Colt-Stratton Co., Broadway at 68th St., New York.

Herreshoff Motor Co., 620 Harper Ave., Detroit. (Herreshoff.)

Hupp Motor Car Co., 1268 Milwaukee Ave., East, Detroit. (Hupmobile.)
Branches: Detroit, Buffalo, Chicago, Cleveland, Denver, Kansas City, Los Angeles, Minneapolis, Philadelphia.

Ideal Motor Car Co., Indianapolis. (Stutz.)

Imperial Automobile Co., Jackson, Mich. (Imperial.)

Inter-State Automobile Co., Dept. N, Muncie, Ind. (Inter-State.)
Branch: 153 Massachusetts Ave., Boston.

Jackson Automobile Co., 1400 Main St., Jackson, Mich. (Jackson.)

Kissel Motor Car Co., 174 Kissel Ave., Hartford, Wis. (KisselKar.)

Knox Automobile Co., Springfield, Mass. (Knox.)

K-R-I-T Motor Car Co., Detroit. (K-R-I-T.)

Lenox Motor Car Co., Inc., Boston. (Lenox.)
Branches: New York, Boston, Chicago.

Maxwell-Briscoe Motor Co., 3 West 61st St., New York. (Maxwell.)

Mercer Automobile Co., 1100 Whitehead Road, Trenton, N. J. (Mercer.)

Michigan Buggy Co., 147 Lay St., Kalamazoo, Mich. (Michigan.)

National Motor Vehicle Co., 1083 22d St., Indianapolis. (National.)

Nordyke & Marmon Co., Indianapolis. (Marmon.)

Paige-Detroit Motor Car Co., Detroit. (Paige-Detroit.)

Peerless Motor Car Co., Cleveland. (Peerless.)
Branches: 660 Beacon St., Boston; Broadway and 57th St., New York; Michigan Ave., and 25th St., Chicago.

Pierce-Arrow Motor Car Co., Buffalo, N. Y. (Pierce-Arrow.)

R-C-H Corporation, 107 Lycaste St., Detroit. (R-C-H.)

Reo Motor Car Co., Lansing, Mich. (Reo.)

Sampson Mfg. Co., Alden, 3 West 61st St., New York. (Sampson.)

Selden Motor Vehicle Co., Rochester, N. Y. (Selden.)

Speedwell Motor Car Co., 80 Essex Ave., Dayton, O. (Speedwell.)

Studebaker Corporation, Detroit. (E-M-F, Flanders.)

United States Motor Co., 3 West 61st St., New York. (Brush, Maxwell, Sampson, Stoddard-Dayton, Columbia.)

Warren Motor Car Co., Detroit. (Warren-Detroit.)

White Co., The, 828 E. 79th St., Cleveland. (White.)
Branches: 320 Newbury St., Boston; Broadway and 62nd St., New York; 629-633 North Broad St., Philadelphia; 138-148 Beatty St., Pittsburg, Penn.; 610 S. Michigan Ave., Chicago; Market St. and Van Ness Ave., San Francisco; 120-122 Marietta St., Atlanta, Ga.; 74 Victoria St., Toronto, Can.

Joe Dawson in National car winning the 1912 500-mile Indianapolis Speedway Race.

Indianapolis 500-mile Race for the second successive year a victory for the

Truffault-Hartford

SHOCK ABSORBER

Joe Dawson, in a National car equipped with Truffault-Hartford Shock Absorbers, finished first in the 1912 500-mile Indianapolis race in competition with the world's best cars and drivers. With this equipment only was it possible to maintain the tremendous speed-average of over 78 miles an hour.

It is significant that the first nine cars finishing were Truffault-Hartford equipped.

	Car	*Driver*	*Time*	*Shock Absorber*		*Car*	*Driver*	*Time*	*Shock Absorber*
1	National	Dawson	6:21:06	Hartford	5	Schacht	Endicott	6:46:28	Hartford
2	Fiat	Tetzlaff	6:31:29	Hartford	6	Stutz	Zengel	6:50:28	Hartford
3	Mercer	Hughes	6:34:56	Hartford	7	White	Jenkins	6:52:38	Hartford
4	Stutz	Merz	6:36:35	Hartford	8	Lozier	Horan	6:59:37	Hartford
					9	National	Wilcox	7:11:30	Hartford

The winning National, "Joe" Dawson up, made an average of 78.72 miles per hour for the 500 miles of the race.

The use of the Truffault-Hartford permits of maximum speed with minimum danger—a fact that explains its use by all of the leading professional drivers. It eliminates jolt, jar and vibration, saving car from excessive wear, tear and racking; is insurance against spring breakage; eases the strain on the tires by keeping them on the ground.

Indispensable for **comfortable motoring,** speed event, hill climb, endurance run, world tour, etc.

REDUCE FRICTION

In the end, friction destroys all motors

WITHOUT friction your motor would never wear out.

Friction slowly but steadily, wastes the power and wears the moving parts of automobile motors. This accounts for their short life.

To reduce this friction you should secure the nearest possible approach to perfect lubrication.

That involves the quality of your lubricating oil and its fitness for your motor.

Different types of motors demand different grades of oil.

The spring-strength of the piston rings must be considered; the fit of the piston ring into its recess; the length of the crank-shaft and connecting-rod bearings; the feed systems; the length of the vacuum period, while intake and exhaust valves are both closed.

Before correct lubrication can be determined, these and other important considerations must be dealt with.

In producing Gargoyle Mobiloils we studied the construction of every American automobile and many foreign makes.

We have drawn up a list of recommendations showing the correct grade of Gargoyle Mobiloil for these various cars.

The complete list will be mailed you on request.

Gargoyle Mobiloils are put up in barrels, half-barrels, and in 5 and 1 gallon sealed, white cans. All are branded with the Gargoyle, which is our mark of manufacture. They are handled by the higher class garages, automobile supply stores, and others who supply lubricants.

Mobiloil

A grade for each type of motor.

If oil saves power, it follows that one oil saves more power than another.

VACUUM OIL COMPANY, Rochester, U. S. A.

General Sales Offices, 29 Broadway, New York City.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

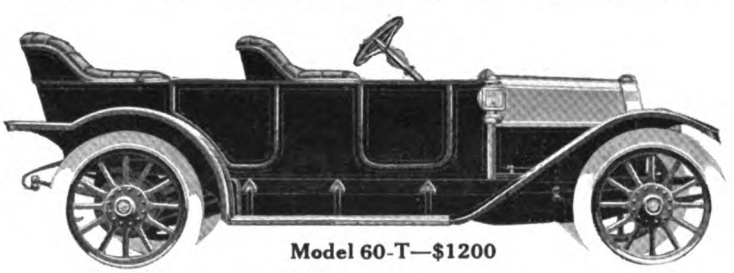
Overland

WE want every prospective purchaser of an automobile to know that the Overland Model 60 costs $1200.



To sell you a Model 60 we want you to know the price first. We do not base our arguments on worthless special selling points in the manner of some manufacturers. Others will tell you of a thousand special features first of all. You may even have to ask the price.

You can get more automobile satisfaction for $1200 in an Overland Model 60 than for $1500 in any other line. That is why, when you come to inspect this car, we tell you the price first. Its merit is then self-evident.

The Overland Model 60 will never be equaled in low price until there is a duplication of the mammoth Willys-Overland production methods.

Ask for book K-47.

The Willys-Overland Company, Toledo, Ohio

Model 60-T—$1200

Wheel base, 111 inches; body, 5-passenger fore-door touring; motor, 4⅛ x 4½; horsepower, 35; Remy magneto; tires, 34 x 4 inch Q. D.; equipment, three oil lamps in black and brass finish, two gas lamps, horn and generator. Self-Starter, $20 extra.

A Perfect Starter at Last!

Energetic Dealers Wanted

A rare business opportunity. Live dealers throughout the entire world wanted to represent us and to install the National Starter

The First Perfect Mechanical Starter

It has always been said that if a *perfect* starter could be built—a *dependable* starter—one that would start the engine from the seat and forever do away with dangerous cranking—that such a starter would revolutionize motoring—that it would add the final touch of perfection to the automobile,—and now, after years of experimenting, comes the first *perfect* mechanical engine starter—the NATIONAL STARTER—the *only* starter that is actually 100 per cent. efficient.

Works *every* time.

No batteries—no tanks—no wiring—no piping—no springs. Nothing but simple ball-bearing gearing.

Dealers in automobiles and accessories, and garage owners will instantly recognize the tremendous business possibilities of this new starter.

The Principle of the National

The National is built on a patented principle.

It is purely mechanical.

A simple pressure of the foot and the engine turns over—just like cranking.

The powerful leverage which is obtained through gear reduction turns the engine over easily—*so easily that you can start on the magneto just as readily as on the batteries.*

The National works equally well in hot or cold weather. It is *not* dependent upon acetylene gas, compressed air, gasoline, electricity or springs. It develops its entire energy through the slight pressure of your foot on the dash pedal—like a clutch. In case of back-fire the National automatically disengages.

We have subjected the National to the severest tests. We have tried it out in all sorts of weather and on all sorts of cars. We made it *prove* its merits.

And now we back every National with an ironclad guarantee for one year.

Easy to Install—Easy to Operate

The National can be installed on any car in about two hours' time. It is fastened to the front of the car in place of the crank. Total weight is about 15 pounds.

A ten year old child can operate the National easily. One pressure of the foot—the crank shaft turns—the engine starts. Just a simple mechanical operation.

A Big Business Proposition

The tremendous demand for a *perfect* starter makes the selling end of the National only a matter of proving its merits. *Thousands and thousands* of car owners will install the National as soon as they see it.

They'll want the advantages of the National for themselves as well as to enable the women-folks to drive.

You see the field is practically boundless.

Big business men consider this a big enough proposition to *open up special demonstrating salesrooms for the exclusive sale of the National.*

They realize the wonderful possibilities of the National.

The retail price of the National is $50.00 *completely installed.* Figure out approximately the number of cars in your territory and you will have an idea as to how broad a proposition this is.

Applications for Agencies Now Being Received

Already we have received thousands of applications for National agencies. We are literally *swamped* with requests. South America, England, Germany, France—energetic dealers in all these countries have applied for National agencies as well as thousands of American business men. But we are prepared to meet the tremendous demand.

We have practically unlimited manufacturing and financial resources.

Agencies for the National Starter are now being allotted. Applications will be handled in the order in which they are received.

Wire us, and come to Chicago if you can—let us show you just how the National is built—let us tell you in a personal interview the tremendous business possibilities of this proposition.

If you cannot come, write us. Full information and large descriptive circular can be had by signing and mailing the coupon.

THE NATIONAL STARTER
TRADE MARK

THE NATIONAL GAS ENGINE STARTER CO.
Dept. 553 B, 30-32 N. Dearborn St., CHICAGO, U. S. A.

If you could see your differential work you'd be mighty careful of its lubrication

IF we could see the actual workings of the human heart, we would swear off smoking and cut out heart weakening habits.

Not seeing, we make mistakes. But nature, the great compensator and adjuster counteracts our blunders.

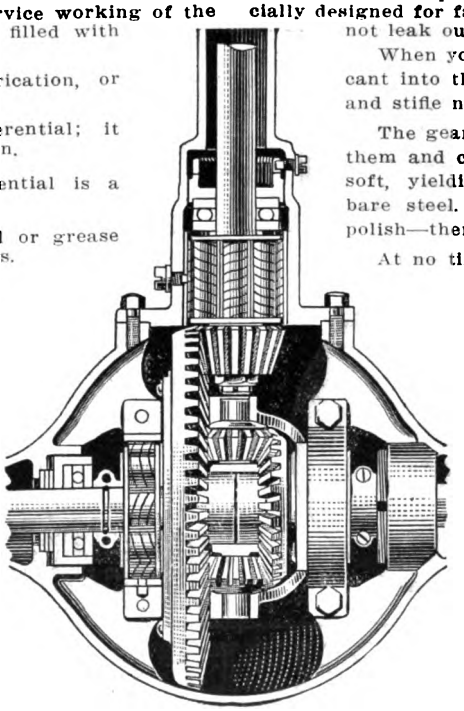
If you could see the actual service working of the differential of your car, you'd be filled with wonder and alarm.

You'd never neglect its lubrication, or consciously use a poor lubricant.

Nature doesn't help a differential; it harms it in the guise of Friction.

Carelessly speaking, a differential is a conglomeration of cogs.

Carelessly considering, any oil or grease is a safe lubricant for a lot of cogs.



But accurately speaking, a differential represents the highest form of gear assembly with bevels, spurs and pinions, running on ball and roller bearings.

Its duty is severe—speed, load, direction, everything variable.

Each side of every tooth gets wear; the load is thrown on instantly, nine times out of ten from a standstill.

Perfect lubrication at any price is no extravagance in a differential.

It is a real economy to use the best lubricant you can buy.

THE DIFFERENTIAL

Every tooth must be coated heavily with good bodied lubricant, not merely wet with oil or filmed with grease.

Keeping the teeth enveloped is only one duty of the lubricant; immersing the ball and roller bearings is another; remaining within the differential housing is another. The lubricant must not escape.

Use "K-No. 000" Grade or "K-00 Special" Grade Non-Fluid Oil for your differential.

The K-No. 000 Grade is a fairly heavy bodied lubricant for use in differentials where the housing would allow a lighter lubricant to escape.

The K-No. 00 Special is a light bodied product especially designed for fairly oil tight housings. This will not leak out where ordinary oil would.

When you have put a supply of this lubricant into the housing, you snuff out friction and stifle noise.

The gear teeth pick it up and it clings to them and coats them. The gears mesh in a soft, yielding cushion—Steel never touches bare steel. The only wear is a slow oily polish—there is no rapid abrasion.

At no time, under hot weather conditions or hard steady drives, does Non-Fluid Oil melt. Nine grease lubricated differentials out of ten, leak, proving the melting of grease. All oil lubricated differentials leak. Often the lubricant follows the axle and makes its escape through the brake drums. The brakes slip, wheels are smeared and tires rot.

Non-Fluid Oil means a clean rear axle, and a perfectly lubricated differential. If you will inquire, you will find that worn out differential gears invariably accompany grease or oil lubrication.

With Non-Fluid Oil the differential outlasts the engine itself. Non-Fluid Oil is amazingly durable. The supply is depleted only by being actually rubbed out of existence by the gears.

The ball and roller bearings are kept bright and never become gum-bound as occurs with rancid grease. Pitting is impossible. Non-Fluid Oil is acidless.

If your gears show wear or make noise, or if your lubricant melts and leaks out, you had better alarm yourself into a trial of

All leading dealers handle Non-Fluid Oil. Ask your dealer, but insist upon the genuine.

TRADE MARK NON-FLUID OIL REGISTERED IN UNITED STATES PATENT OFFICE

In purchasing Non-Fluid Oil be sure the can is orange colored and bears this trade mark.

We are not talking of an expensive innovation. The actual yearly outlay for Non-Fluid Oil is less than for any other lubricant.

Post yourself further on the differential. And then post us a request for a free sample of either grade. Paste the attached coupon on a postal. Mention the grade you desire.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (Trade-mark)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3⅛ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

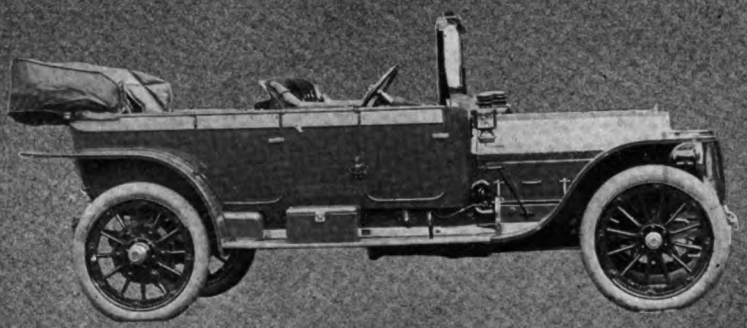
Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3⅛-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3⅛-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS



You want the Best? Ask your DEALER for the "CHELSEA"

On Sale by Leading Jobbers and Dealers

Silent Great Western FORTY 1913

Another Bullseye for 1913

Great Western Hits Highest Mark of Value

Last year we swung into the line of big sellers by a vigorous announcement of the advance 1912 features we had put into our car. This year we break all records by not only including a host of new up to the minute improvements, but also offer the 1913 Great Western, fully equipped **at $1,585 or $265 less than the previous model.**

With our increased output, cutting down factory expense, we are offering you a car at $1,585 which for beauty, power, speed, quiet operation, reliability, completeness and general all around satisfaction, compares with any $2,500 to $3,000 car in the world. It is not our policy to make only a few cars and charge you a big price for our name. Rather than that, we aspire to place dozens of Great Westerns in every community in the United States—owned by people who want the right kind of service and convenience out of their cars—but who are not averse to saving a thousand dollars or more at the outset.

The 1913 Great Western Touring Car

The 1913 line includes a Roadster, Four Passenger Touring Car, Five Passenger Touring Car and a Four Passenger Sedan for winter use.

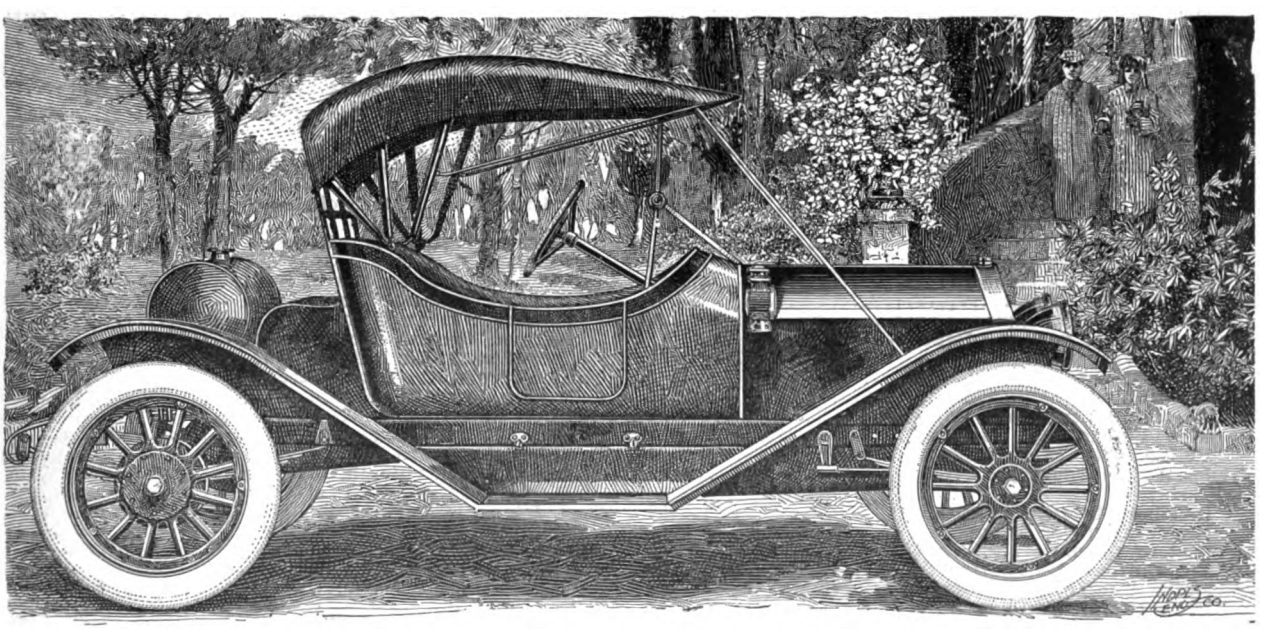
1913 **Great Western** FORTY $1585

18 Years of Progress Back of This Sturdy Guaranteed Car

LUXURY, POWER *ABSOLUTE SILENCE*



This year's Great Western is an amazing value, including all these great new features:

Presto Self-Starter---Electric Lights---Quiet Running Motor

Nickel and black trimmings throughout
Stewart & Clark Speedometer
Solar electric lights
Silky mohair top
Fairfield rubber dust hood
Rain vision ventilating wind shield
36 x 4 inches tires
Demountable rims
Typhoon electric signal
Foot and robe rails
Tool box and tools
L head 4½ x 5½ long stroke motor
Full 40 Horse Power
Accessible unit power plant
Enclosed valves all on one side
118 inch wheel base
Tire irons and extra rim
Gasoline tank gauge
Dee upholstering, hand-buffed leather
Invisible coil with lock switch
Jack, pump and tire repair kit
Full floating rear axle with large New Departure and Hyatt bearings
Large powerful double internal expanding brakes
Tie rod behind front axle
Cellular front radiator
Latest Remy magneto with kick switch
Easy riding Vanadium steel springs
Handsome body, deep blue color, black walnut trimmings, 18 processes of body finish

Nearly everybody has heard of the Great Western's wonderful record as official pathfinder, prize hill climber and official selection by the U. S. Government for Indian service in the West. These facts are absolute proofs of quality. Send for new 1913 catalog telling in detail all about this handsome, trustworthy car. A complimentary subscription to ***The Tattler,*** our interesting little monthly magazine, also on request.

Dealers: There's a great big sales activity stirring everywhere for the Great Western. It has the quality that attracts attention and makes people decide to buy. Our 1913 organization is being extended to cover every live town in the United States. We can take on a a few more hustling dealers who want to handle a fast selling car. Write today.

The 1913 Great Western Roadster

The 1913 line includes a Roadster, Four Passenger Touring Car, Five Passenger Touring Car and a four Passenger Sedan for winter use.

KisselKar

Electric Started and Lighted---Extra Liberal Wheelbase---Extra Roomy Tonneau---Low, Deep Seats---a New Distinct Achievement in Car Comfort.

The 1913 KisselKar surpasses every previous idea of car comfort. Every factor of comfort is incorporated in the 1913 KisselKar to a liberal degree not before equalled in any other automobile.

Every model has an extra generous wheelbase, which besides emphasizing the low, rangy design, bridges the irregularities of the road in a way that gives the KisselKar a steadier, milder and conspicuously rare riding comfort.

Big wheels, big tires, shock absorbers, springs designed according to weight of **each** model, and eleven inches of seat upholstering absorb the road vibration. The liberal wheelbase permits the unusually roomy tonneaus and the extra depth of the low new design seats. These exceedingly deep seats give the occupants a quarter-reclining position, encouraging full restful relaxation, and eliminating every need or tendency to brace against sideway.

The new construction of the 1913 bodies, the graceful outbending panels, the swelling curves which replace edges and corners---the general modeled effects of the new bodies give the 1913 KisselKar the distinction sought after since the automobile has been considered less as a mere machine and more as the aristocratic pleasure vehicle of modern life.

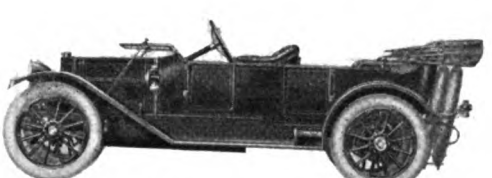
Flexible Power

The flexibility of the motor gives the KisselKar a wide range of throttle control which makes all ordinary driving a mere matter of shifting the throttle lever or pressing the foot accelerator. You can throttle down on "high" to a creeping pace in traffic and take hills at easy, normal speed without rushing or shifting gears. Gear shifting with a KisselKar is occasioned only by extremely difficult road condition. For all average driving, the flexible KisselKar motor drives smoothly and silently on "high" gear as fast or as slow as you want to go.

The KisselKar electric self-starting and lighting system is perfected and refined.

Turn the switch at the front of the seat. Automatically it retards your spark beyond possibility of "back fire," causes the carburetor to release a "rich" mixture, switches the storage battery on to the dynamo-motor which begins action as a motor and turns over the engine. This action is positive. It is impossible to fail—turn the switch and your engine goes—every time. This starting system is powerful enough to run the car a considerable distance.



Now that the engine is started, the switch automatically resumes its normal position—the battery "cuts out" of the starting system—the magneto furnishes ignition—the dynamo-motor ceases to operate as a motor and begins running as a dynamo, charging the storage battery for lighting and future starting.

The complete operation of this system is automatic—one turn of the switch is all you have to do with starting.

The lighting system takes current from the batteries by Edison's three wire system, which permits the use of lamps of about twice the candle power ordinarily used.

KISSELKAR "SIXTY" SEMI-RACER $3150
(Fully Equipped.)

KISSELKAR "FORTY" SEMI-TOURING $2000
(Fully Equipped.)

Big Line of Commercial Vehicles

The KisselKar commercial line includes 1500 lb., 1½ to 2, 3, 4, 5 ton trucks, delivery wagons, fire department apparatus, omnibuses, etc. All type bodies—special bodies designed and built to meet the needs of any service. KisselKar trucks have excess capacity and reserve power to meet extremest demands. Competitive road tests have demonstrated KisselKar Trucks to be from 15 per cent. to 20 per cent. more economical of fuel than average trucks. Easy accessibility and extra strong construction minimize maintenance. Lock on differential throws traction to both rear wheels when desired, eliminating possibility of being stalled on bad roads.

Kissel Motor Car Co.

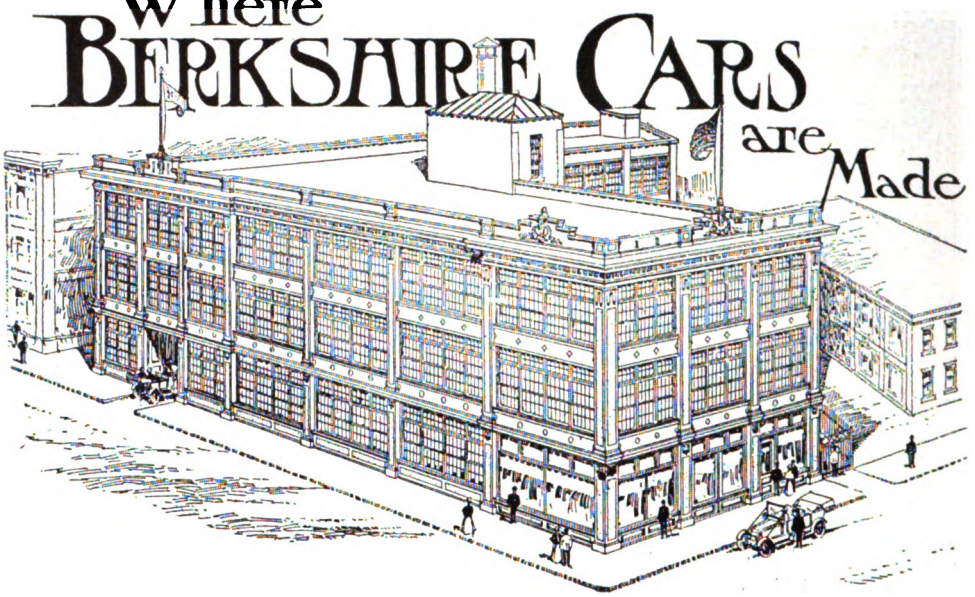
HARTFORD, WIS.

KisselKar Service



KisselKar service is supplied and directed by the manufacturers. Specially constructed and equipped buildings at principal points of the United States are maintained as service-centers, cooperating with selling representatives in giving a complete detailed service to every KisselKar owner. This national organization of service-centers brings the owner in close touch with the manufacturers. The result is unusually low running cost, low maintenance and slow depreciation, and the fullest realization of motoring pleasure. Following is a partial list of KisselKar branches and agencies:—

Boston, New York, Chicago, Milwaukee, Kansas City, Los Angeles, Minneapolis, St. Paul, St. Louis, Dallas.

Philadelphia, Cleveland, Detroit, El Paso, San Antonio, New Orleans, Baltimore, Omaha, Butte, Denver, San Francisco, Seattle, Portland, Duluth, Buffalo, Pittsburg, Hartford, Conn., New Haven, Albany, Troy, Montreal, Quebec, Toronto, Winnipeg, and 200 other principal points throughout America.

VOL. XXXIII, No. 12 JULY 25, 1912 Price, $1.00 the Year

RHODE ISLAND'S TAR MACADAM HIGHWAYS.

About 45 Per Cent. of State Roads, Built or Building, So Constructed--Resurfacing the Water Bound Ways to Bring System to Highest Standard.

NO HIGHWAY construction or maintenance work throughout the world is more interesting, no road development is as significant, as that now progressing in the State of Rhode Island under the direction of its State Board of Public Roads and the supervision of Chief Engineer John Bristow. The road improvement is deserving the attention of every citizen, and every national, state and municipal official, because it is the inauguration of a policy that has been determined after careful experiment with materials and methods, and because the preservation of the roads already improved is regarded as important as the original construction.

Boston Post Road, Kingstown, R. I., a Stretch Built Four Years Ago by the Methods and With the Materials Now Adopted by the State Board of Public Roads.

The work is deeply significant in that, after practically six years' tests of road surfacing, a scientifically prepared binding material is used, one that was found the best adapted to the purpose of any that has been tested. The state has contracts already let, or to be let before Aug. 1, for the construction of 72.65 (approximately) miles of tarvia macadam, and the board in its work of maintenance purposes to resurface as much of the 225 miles of water bound macadam ways as the funds available will permit, besides keeping up to a high standard the surface of the 26 miles of tar macadam previously built.

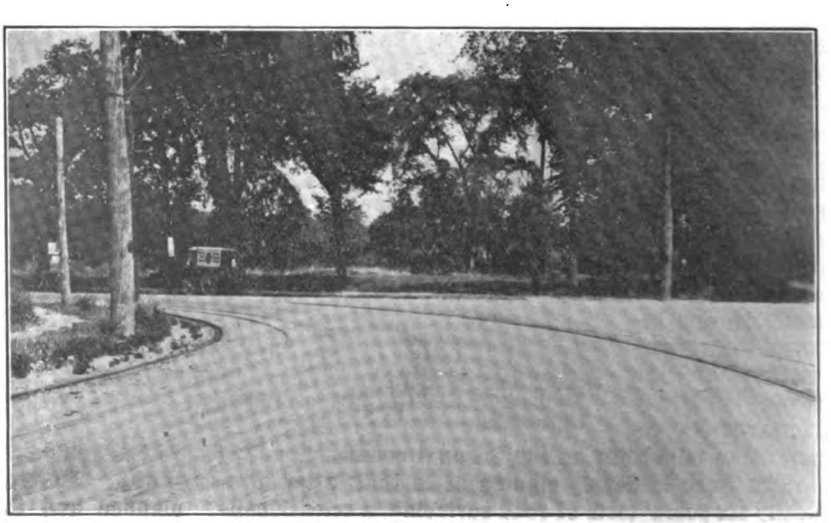
The state board proposes to have every mile of highway under its jurisdiction surfaced with a binder that will resist both traffic and the elements. In this Rhode Island is in advance of every commonwealth of the United States, and of every national government of the world. The state system of roads has been carefully planned and the improvement has been systematic. The recommendations of the state board have been approved by the people and the Legislature, and there

Digitized by Google

The West Barrington Road, a Section of Experimental Highway.

will be spent this year approximately $850,000, including the contracts let which may not be completed until 1913.

With the completion of the new work projected and the resurfacing as planned by the state board, there will be approximately 325 miles of tar macadam highway, comprising the main roads of the state, and connecting with the principal thoroughfares through the cities. No state work is done in the cities, save on the Plainfield pike through Cranston.



Much of the work now progressing is on roads that will afford direct connection with the trunk lines of other states. There will be no less than six that are available for travellers going or coming from eastern Connecticut, and equally good connections are made with the Massachusetts highways. To illustrate, one road will provide a more direct route from Providence to Westerly, than the old one following the shore of Narragansett bay and the ocean, and there will be three connections between the new and the old route. Similarly the majority of the other main ways will be cross connected. The roads generally converge at Providence. The traffic is well provided for on both sides of Narragansett bay and on the island of Rhode Island. There is as well a highway that extends north from Jamestown to Conanicut park on Conanicut island, in the town of Jamestown.

From these details it will be seen that the comparatively small mileage of state roads means a system in its fullest sense. As the total length of public roads in Rhode Island is about 2350 miles, the roads for which the appropriation has been made will give about 14 per cent. improved of all the highways over which the public can drive, a percentage very much larger than that in any other state of the union.

Rhode Island was by no means the first state to take up systematic highway building, but it was, and probably is today with one or two exceptions, the only one in which the supervising body is free to exercise its discretion as to methods. The only restriction on the board is that money once directly appropriated for a work must be expended for the specific purpose for which it was provided. The legislature makes annual appropriations, but bonds may be issued for specified or general purposes. The board consists of five members, and as there has been no change in its personnel since it was created, Feb. 1, 1902, its endeavors have been along well defined lines and in accord with public requirements determined by the board after careful examination of conditions and after much discussion within and without the board.

In 1906 the board began experiments to ascertain the efficiency of tar treated roads with the two-fold purpose of suppressing dust and resisting the wear of traffic. These experimental constructions were observed for four years and then the board declared itself satisfied with the results. Perhaps its position is best defined in the annual report for 1910. After stating that water bound macadam roads would not endure, it continues as follows:

"At the present stage of investigation the consensus of opinion appears to converge upon the use of a

A Much-Used Corner Constructed With Tar Materials—One of the Best Pieces of State Road in Rhode Island.

Digitized by Google

Pouring the Heated Tarvia on the Evenly Distributed Stone Surfacing.

bituminous binder as the most practical remedy for overcoming the deficiencies characteristic of water bound macadam, although a wide difference of opinion exists among road builders as to the extent that this product should enter into the new construction in order to meet the requirements, and no one has yet pretended to lay down a rigid rule applicable to every case among conditions so diversified as those existing in different localities of our own country.

"Our own experience, however, with bituminous road building with such material as we have on hand, the details of which have been worked out by our engineering department and most heartily sustained by this board, has proved decidedly satisfactory, producing a dustless and in every way an ideal surface at an additional expense of from $1500 to $2000 a mile. Our first construction with a bituminous binder, after a test of nearly four years' use, appears as impervious to traffic and weather influences as when first laid; and this, too, with practically no care or expense incurred for maintenance or for allaying the dust.

"Apparently, this kind of construction for Rhode Island conditions not only gives the best satisfaction to the user and the people residing along the road who suffer from dust nuisance of common macadam, but for a term of years, is far the most economical when the cost of maintenance is considered."

This report stated that the bituminous macadam roads built in 1908 proved to be so satisfactory that in 1909 the construction of 21 miles of road to be built with a bituminous binder was authorized.

Relative to the method of construction the following statement is made in this report: "In all cases the work was done by the mixing method. With the exception of the addition of the bituminous mixture, the method of construction is similar to that employed in building an ordinary macadam road. After the subgrade has been thoroughly rolled the No. 1 broken stone varying in size from 1.25 to 2.5 inches in their longest dimensions, is spread to a depth of six inches and rolled to four inches. In two cases the surface of the No. 1 course was treated with about one gallon of bituminous material to the square yard, but ordinarily this application is omitted. The No. 2 stone varying in size from .5 to 1.75 inches in their longest dimensions is next deposited on dumping boards and thoroughly mixed with hot bituminous mixture with the aid of rakes and shovels until the stones are coated. The amount of bituminous material required for this purpose varied from 1.25 to 1.75 gallons a square yard, depending upon local conditions. The coated stones are then placed upon the No. 1 course to a depth of three inches and rolled to two inches. When this surface has been set up, a flush coat of bituminous material (about .75 gallon to the square yard) is applied by means of squeegees and screened chips varying in size from .125 to .25 inches in their longest dimensions are rolled in."

The bituminous material used during 1909 for mixing the stone was generally a coal tar or a mixture of coal tar and asphalt, varying from one of tar to three of asphalt to equal parts of tar and asphalt, and for a flush coat coal tar and a solid asphalt were

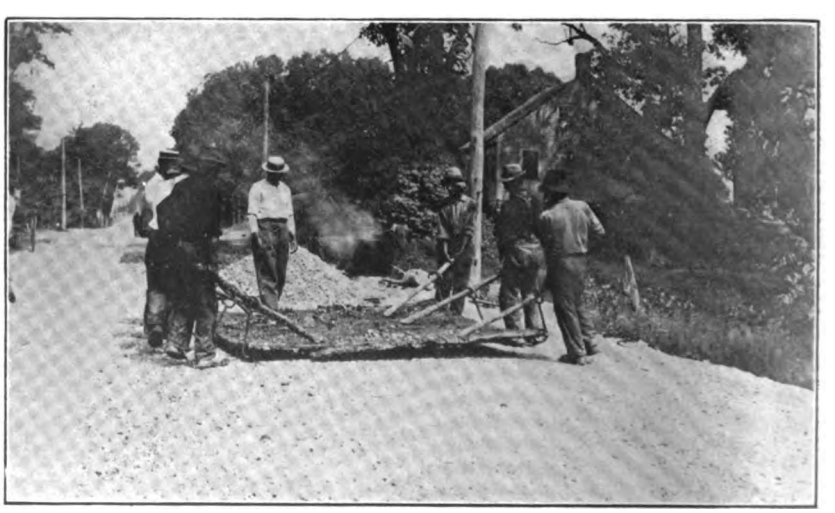
The Hand-Mixing Process—Turning Over the Stone to Insure a Thorough Coating of Tarvia.

Digitized by Google

Placing the Tarviated Upper Course of Stone, Mixed by Hand, on the Well Rolled Lower Portion of the Roadbed.

used. Several small sections of road were constructed adjacent to each other of refined bituminous materials for experimental purposes and were carefully observed. Careful record of each experimental section of road was kept and study made of the cause of success or failure of any particular trial, the notes including the location of the road, length, width, thickness of stone, amount of crown, nature of subgrade, percentage of grade, dates covering construction, a census covering the amount and kind of traffic, form of construction, tests of the bituminous material, tests of the stone, and also all items incident to the cost of the road so that the costs a square yard could be obtained.

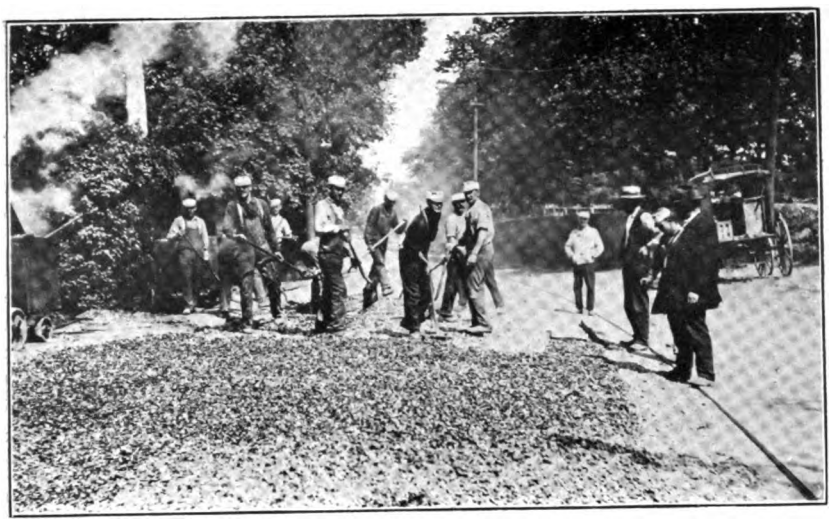
The standard width of state highway in Rhode Island is 14 feet of macadam with a shoulder three feet in width at either side, between the ditches or gutters or banks, and while some of the roads are wider in the village, the cost of the additional width is borne by the towns in which they are. Generally the town and the state jointly contract for the roadways that exceed the standard of width and the difference in cost between the standard roadway and what is actually built is paid by the state, which in turn is reimbursed by the town.



Considering the work that is now in progress reference can well be made to the annual report of the state board for 1911, which sets forth that there was during 1911 no new construction of the state system, owing to no appropriations, and that it was an anxious year for the board because of the utter impossibility of maintaining the state roads already built in a fairly passable condition with the limited means at its disposal. The report states:

"Perhaps it is needless to say, that under these circumstances, the prompt attention that much of our water bound macadam required early in the season, had to be omitted altogether, which accounts for their present badly torn condition, especially those sections that are subject to a heavy automobile travel and lying adjacent to the cities and the compact centres.

"On the other hand, it is gratifying to be able to report that little or no expense for maintenance was required upon the 26 miles of bituminous road now built, except upon two short sections which were finished with an asphalt painted surface at the time of construction and upon two short sections where the patent binder proved to be comparatively worthless. The former sections had to be sanded to absorb the superfluous asphalt appearing on the surface during warm weather, so as to prevent its adhesion to vehicles and persons using the road, while the last two sections had to be resurfaced with a straight tar binder.



"After five years' experience with bituminous road construction, we are realizing more and more conclusively the great value of this kind of road when it is properly laid with the right kind of material. Economy in maintenance with a clean, mudless and dustless surface at all seasons of the year are some of the features which recommend it for general approval.

"The first section of bituminous road built by the board and opened to travel five years ago—built of

Mixing Gang Carrying the Mixing Platform Along the Roadway, Ahead of the Job.

Digitized by Google

Laying the No. 2 Course of a State Highway, the Portable Heating Kettles and Hand Method of Preparation and Distribution Being Shown.

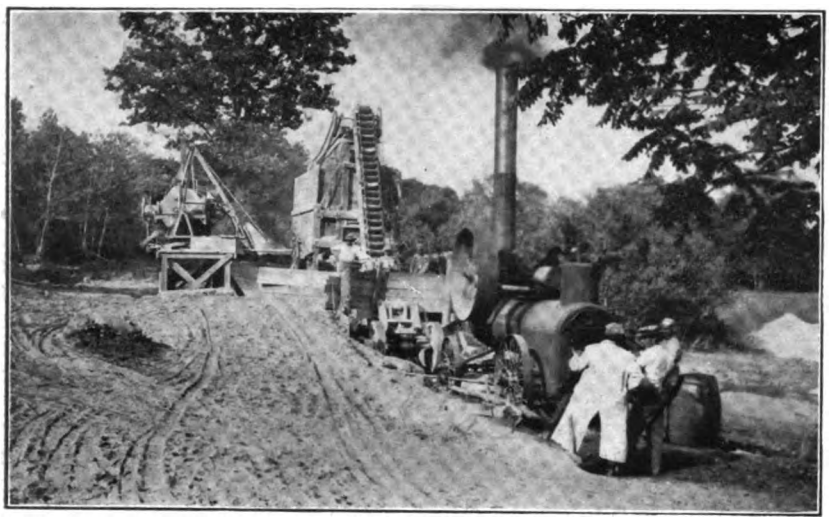
crude coal tar—remains comparatively intact without having required the slightest expense for maintenance and apparently is good for five years more under the same traffic conditions. Local defects which soon appeared on the surface of certain other sections of bituminous roads, built during later years, were readily accounted for and easily remedied at a trifling expense.

"Much, however, of the 225 miles of water bound macadam, now under the care and upkeep of the board, will require the earliest possible attention.

"We have learned from experience, as all the states and countries engaged in modern road building have learned, the uselessness of trying to maintain this latter class of roads for any length of time with a smooth and even surface, where the motor vehicle traffic is very great, by the methods heretofore employed. * * * We regard the restoration and maintenance of much of the water bound macadam already built of far greater importance than any proposed new construction * * * Wherever a bituminous road has not already been built, a much more substantial and durable surface than a water bound macadam is imperatively needed in view of the constantly growing travel upon it, especially the heavy motor truckage, which is fast increasing and extending further into the open country every year. The base or first course of broken stone on all these roads, except a few local defects, continues firm and in good condition to receive a new surface, notwithstanding much of it was built seven or eight years ago.

"After extended investigation of the subject and upon the advice of our chief engineer, we recommend that all these roads be given a new bituminous surface, similar to the best tar construction now built in the vicinity of Narragansett Pier in the south county.

"A new plan now being perfected whereby the mixing of the stone and the bitumen can be done at the crusher by machinery, will considerably hasten the work and diminish the cost incurred by the old method of mixing by hand on the road.



"Without entering the many details of appiying some 10 different ingredients in their various combinations employed in our experimental tests—these having been given in former reports—suffice it to say that we have been forced to the conclusion that the straight tar in a crude or refined state, is the most effective and economical binder to be used in building a macadam road surface and best suited to the climatic conditions and requirements of travel in our own state."

The state board made recommendation that 19 sections of road ranging from .5 mile to 18 miles be built, the estimated cost for the total of 72.65 miles being $555,082.72, an average of $7640.50 a mile. These estimates are for bituminous construction, and the last contracts covering 12.5 miles will be let July 31. The specifications for this road building call for a somewhat different size of stone than mentioned in a quotation from the 1909 report, in that the size of the No. 1 or lower course is from two to three inches in longest dimensions, and the No. 2 course from .25 inch to two inches in longest dimensions, and that the

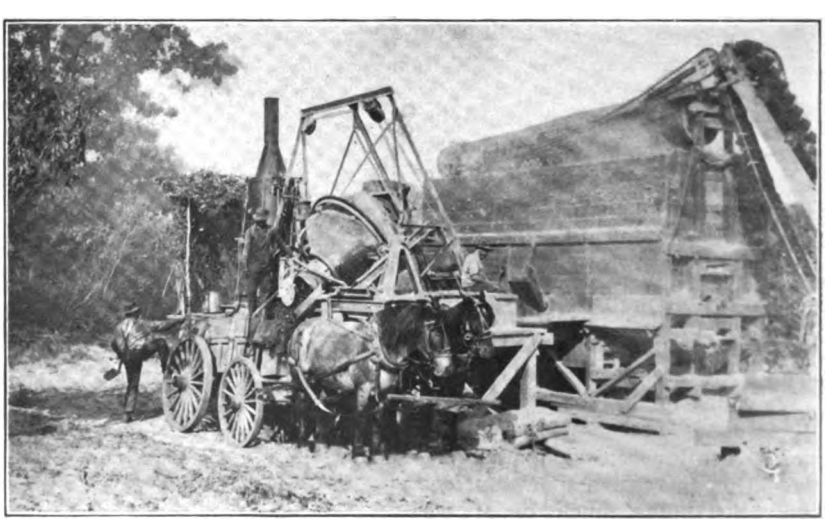
A Model Combination of Stone Crusher and a Machine for Mixing Road Material—A Bristow Bros. & Knowles Plant.



binding material be tarvia, a refined coal tar product that has been scientifically prepared for this work, and which was one of the materials with which extended experiment was made by the state board. The other specifications are unchanged. This affords a state road six inches in depth with a course of four inches of consolidated stone covered with a second course of stone thoroughly covered with tarvia, on which is a layer of stone screenings, thoroughly rolled.

The methods of doing the work vary on different jobs. All the first work of the board has been done by hand mixing, but it is now planned to use mixing machines wherever possible. At the present time some six machines are in use on state jobs either by contractors or by the state itself.

In the hand mixing work the stone is spread upon wooden platforms, which are moved along as the job progresses. The tarvia is then measured out and spread over the stone. The batch is turned over by men using heated shovels until every particle of stone is covered with tarvia. Men take the coated stone and place it by shovelfuls on the road. Another man with a rake levels the stone off until it is brought to the proper thickness. The road is then rolled and a seal coat of tarvia spread upon the road with brooms. A coating of pea stone follows, and the steam roller finishes the consolidation of the road. The tarvia is heated in kettles along side of the road. In the greater part of the jobs now being done by the state board it is shipped to the vicinity of the work in tank cars and barreled for storage.

On the jobs where mixing machines are used, a batch mixer of one-half or one ton capacity is employed. Usually much thought is given to the placing of the different parts of the plant so as to minimize the haul and handling of stone and other material. The stone crusher delivers stone into bins from which it is transferred by gravity to the batch mixer. The required quantity of tarvia is added and a small engine turns the mixer over for two to four minutes until every particle of stone is covered with tarvia. The batch is then discharged into a waiting dump wagon covered with a tarpaulin and is carted to the work, where it is deposited, to be raked as in the hand method. The mixing machines are provided with a torch fed by fuel oil, which heats the stone in the mixer when this is necessary. The machines are capable of turning out 20 to 30 cubic yards an hour, but as it is impossible to place this amount of stone they are not worked to their capacity. The machines are proving quite economical and are expected to save very quickly their first cost of about $2000. Several of the contractors, among them Bristow Bros. & Knowles, have adopted the machine method and the state is now using them at Bristol, Norwood and Chepachet.

While the contractors are building the new bituminous road the state board, which has an appropriation of $250,000 and the receipts from the automobile registration, which will closely approximate $100,000 this year, at its disposal, is carrying on the resurfacing of the water bound macadam roads of the state, and is transforming them into bituminous roads. This work is not contracted for, but is done by the state under

Discharging a Batch of the Heated, Tarviated Stone from a Mixer Into a Cart for Haulage to the Job.

Digitized by Google

the direction of the state engineer and his assistants. In this resurfacing work the upper course of stone on the old road is sacrificed without disturbing the lower course. Whatever stone is necessary to remedy the defects in the surface is added, and after consolidating a fresh upper course of stone thoroughly mixed with tarvia, either by hand or machine, is put on and rolled to a two-inch thickness. Stone screenings with rolling complete the work. In this manner the roads are being transformed from badly worn macadam to roads that are as durable and free from dust and as satisfactory as the highways which have already been built with tar materials.

Just how much of this resurfacing will be accomplished this year is dependent upon circumstances and conditions. It is believed that there is available a sufficient fund to do the greater part, if not all of the work, and with the methods now in vogue it is probable that the estimate made, based upon the work of 1909, can be somewhat improved upon. Some part of this resurfacing may be deferred until next season, but the state board is carrying out its policy of transforming the ways as rapidly as possible, with the intention of minimizing maintenance cost, by having every inch of the state roads of bituminous macadam.

Because of the work on the highways this year motoring in Rhode Island may not be as pleasurable as in previous seasons, but the people of the state who motor have no criticism because of temporary inconvenience, and they and visitors alike are in fullest accord with a policy that is developing close to completion the best roads maintained by an American commonwealth.

PROMOTION FOR NASH.

Following the resignation of W. J. Mead as vice president of the General Motors Company, Detroit, to become president of the Amplex Motor Car Company, Mishawaka, Ind., comes the announcement that C. W. Nash, for the past two years vice president and general manager of the Buick Motor Company, Flint, Mich., a subsidiary of the General Motors Company, has been elected vice president to succeed Mr. Mead. This promotion does not mean that Mr. Nash will relinquish the management of the big Buick plant at Flint. On the contrary, he will continue to concentrate his attention and efforts upon the operation and further expansion of the Buick business, which, under his management, has maintained a foremost rank in the automobile industry.

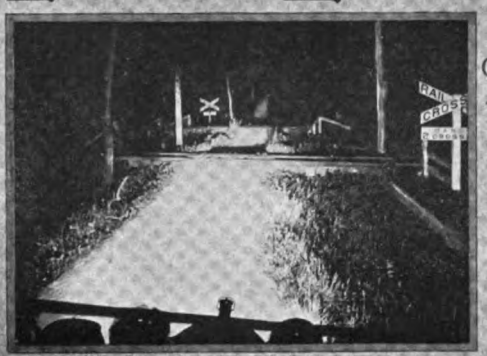
NEW AMERICAN PLANT.

With the completion of the three-story brick and steel addition to its plant No. 2, the American Motors Company, Indianapolis, Ind., maker of American cars, now has what is believed to be the largest manufacturing plant in Indianapolis. This increase in factory space is said to be due to the unusual demand for the underslung types, produced by this concern.

At the beginning of the 1912 season it was found necessary practically to double the available space, and again just before the 1913 announcement, plans were made and the foundation laid for a further increase in this respect. This second addition is now completed and ready for occupancy. It is 85 by 120 feet, providing about 30,000 square feet of floor space. The equipment is new and of the latest design. One piece of machinery is a 36-ton hydraulic press to be used in connection with the sheet metal work and in shaping the bodies.

TWO NEW SCHACHT MODELS.

Two new models, distinctly different in body design but employing the same chassis, comprise the 1913 line of the Schacht Motor Car Company, Cincinnati, O., according to the recent announcement of the company. These will be known as model NS, a five-passenger touring car, and model KL, a roadster. Both will be equipped with fore doors, and will present all the latest refinements, including self-starter, electric lights, demountable rims and one extra rim, etc. Left hand drive with centre control is employed.



The chassis is practically of the same construction throughout as in the 1912 offering. However, the motor is a new design, being of the monobloc type, with three bearing crankshaft. The bore is 4.25 inches and the stroke, 5.5, making it practically a long stoke unit, and the rating is 45-50 horsepower. Other features include the use of the cellular radiator, full floating rear axle and larger brakes.

ATLAS ENGINE SALE.

Announcement is made that the Atlas Engine Works property in Indianapolis, Ind., will be sold under a superior court order, July 29. It is stated that a corporation in Detroit, which is desirous of establishing a plant in Indianapolis, will be among the bidders. In the event that this company shall be the successful bidder, the tentative terms of purchase are said to have been arranged as follows: The purchaser to assume the mortgage against the property which secures bonds aggregating $1,050,000; to pay $105,000 indebtedness secured by the bond issue of $150,000 and cancel the bonds, and to turn over to the receiver sufficient money to pay all mercantile accounts contracted since the creditors' committee took charge of the plant, as well as the salary rolls and receivership expenses, amounting to about $80,000. The upset price has been fixed at $80,000. The Detroit concern, it is claimed, would manufacture the Diesel and silent Knight engines as heretofore, and also a line of four-cylinder cars, employing from 5000 to 7000 men. There is no intention of removing the present plant now in operation to Detroit.

Electric Lighting of Motor Cars

Outlining Various Systems Employed and Methods of Operation.

By C. P. Shattuck

Part XI—The Holtzer-Cabot Dynamo System.

ONE of the fundamental principles of efficient lighting by electricity is that the voltage shall be steady, and that the filaments of the lamps be heated to and maintained in a predetermined incandescent state. Variations in the voltage or strength of the current impair the value of the bulbs as an illuminant, and this holds true irrespective of the source of energy, whether it be a storage battery or a mechanical generator. With either member supplying the current, it is obvious that should the voltage drop below that necessary for the proper operation of the lamps, their brilliancy would become dimmed, while on the other hand a marked increase in voltage would tend to destroy the filaments. Fluctuations in voltage are productive of flickering in the lights, an undesirable feature in motor car lighting.

As a source of electricity the storage battery is held by many engineers to make for the ideal lighting equipment for the automobile, provided, however, means are incorporated in the system for maintaining it in a properly charged condition, and that the charging be performed automatically in accordance with the requirements of the maker. Believing that a storage battery could be charged by a dynamo operated by the energy of the motor car, and the rate of charge so controlled as to obtain the greatest efficiency and life from the battery, the Holtzer-Cabot Electric Company, Boston, conducted a series of experiments extending over a period of two years to determine the best type of dynamo adapted for this particular service. From the outset the aim of the company was to produce a simple, durable system, one that could be easily installed and maintained, as well as being free from devices which could be tampered with by the inexperienced.

The early dynamos were of the differential wound type, driven by friction at high ratios, charging an 80 ampere-hour capacity battery, the dynamo being cut in at high motor speeds. These were installed on machines and although they gave fairly good service it was found that improvements could be made.

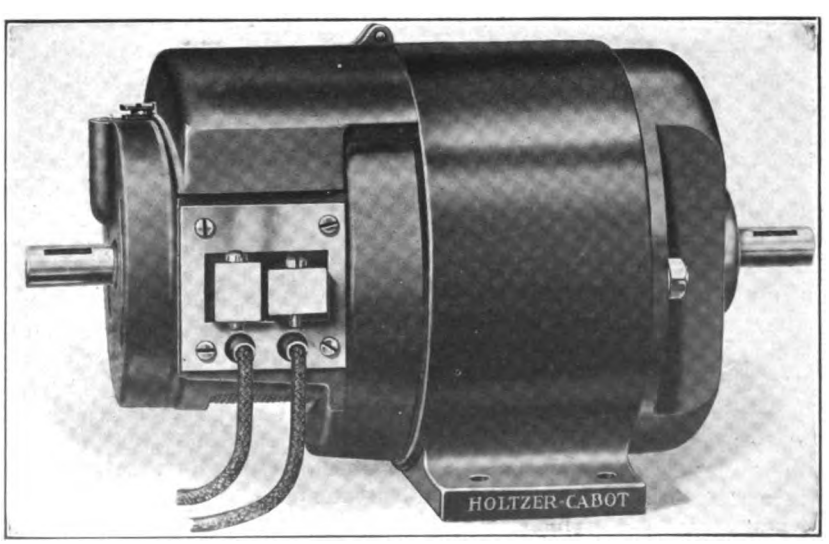

Fig. 69—The Holtzer-Cabot Lighting Dynamo, Noticeable for Its Simplicity, Generating Positively at High or Low Speeds and Self-Regulating.

The results of the practical tests, however, convinced the company that a practical and highly efficient equipment could be produced by designing a dynamo which would automatically and properly charge the battery without incorporating in the line any mechanical or electrical devices, the battery supplying all the current to the lamp, signal horn and ignition circuits. It is an easy matter to produce a dynamo which will charge a battery provided the generator is driven at a constant speed, but the difficulty encountered in designing a machine for the automobile has

Digitized by Google

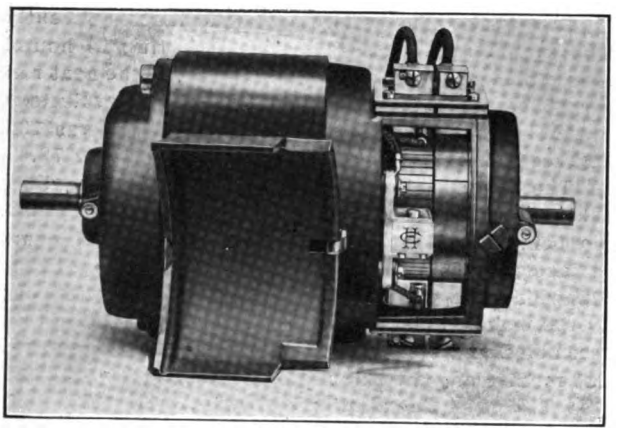

Fig. 70—Dynamo with Cover Removed to Illustrate the Accessibility of Components.

been to protect the dynamo and battery from the excess current generated at high speeds.

These obstacles have been overcome in the new Holtzer-Cabot dynamo, which is electrically regulated by the construction of the pole shoes, without extra windings or parts of any kind, the current generated at high speeds being controlled by self-induction. It is claimed by the designer that a high efficiency is also obtained at low motor speeds.

Features of System.

The features emphasized of the system are: A simple, compact, noiseless, durable dynamo, which may be operated in either direction and without regard to polarity; a machine generating positively at low speeds and requiring no adjustment or attention whatsoever; ease of installation, being equipped with means for driving at either end of the armature shaft; high efficiency and a steady and uninterrupted light at all speeds of the automobile and even when the latter is inoperative.

The material and workmanship incorporated in the dynamo is in keeping with the high grade maintained by the Holtzer-Cabot Electric Company, which has an extended experience in the construction of dynamos and motors and whose product is well and favorably known in the electrical world. That the dynamo is very compact will be noted by the outline dimension diagram at Fig. 74, which gives the extreme over-all length as less than 12 inches, this measurement including the extensions of the armature shaft, which are key seated to take standard Woodruff keys, an arrangement permitting the dynamo to be driven at either end.

The armature is of liberal size, being 3.5 inches in diameter, and is form wound, cotton insulated wire being treated with a special enamel, which is baked to render it impervious to heat or moisture. The commutator is highly sub-divided, having 50 segments, these being separated by carefully selected mica, and being 2.875 inches in diameter with one-inch face, a design making for perfect commutation and long life.

The armature shaft is of a high grade steel, .75 inch in diameter, carefully machined and finished, and rotates in imported Hess-Bright ball bearings, these being fitted at either end. These members are fully enclosed and protected from foreign elements, and engage with recesses in the two end housings which are held securely by bolts. The central housing is of laminated soft iron, which provides a maximum magnetic field, and is welded to the foot base, insuring rigidity as well as stability.

The location and peculiar construction of the pole shoes will be noted at Fig. 71, which also depicts the components of the dynamo. The pole piece is circular, constructed of tubing, accurately bored, and it will be seen that it is slotted. By certain modifications of these pole shoes the maximum current is limited to the amount desired.

Brushes and Holders.

The brushes utilized to collect current from the commutator and automatic switch, are of the French copper carbon type and are carefully ground, polished and fitted, being subjected to rigid inspection. A noteworthy feature of the construction of the brush holders is the method of retaining the spring. The latter is pleated, providing proper contact of the brushes, and that part held by the holder is provided with slots, so arranged that it is impossible to replace the brush in other than its proper holder and correct position.

A feature of the Holtzer-Cabot dynamo is the au-

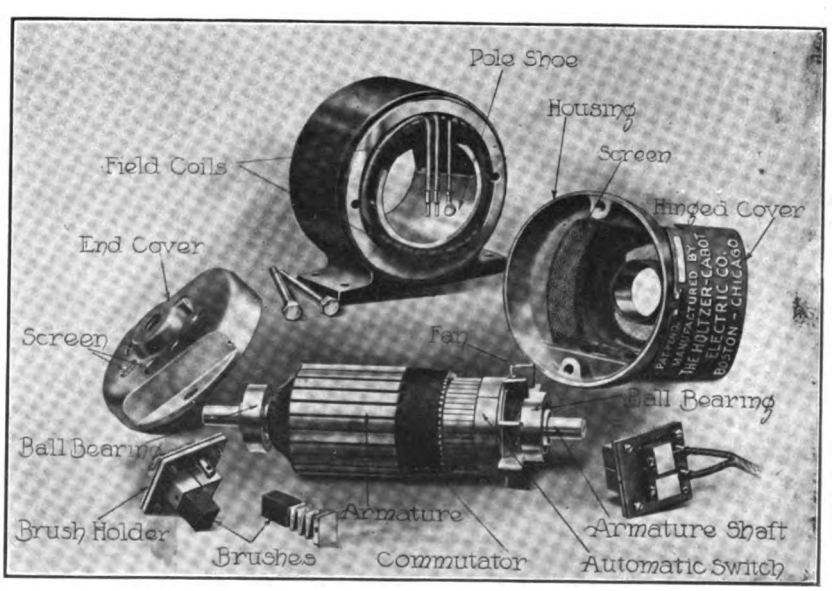

Fig 71—Depicting the Components of Dynamo in Which Is Incorporated the Best of Workmanship and Material.

Digitized by Google

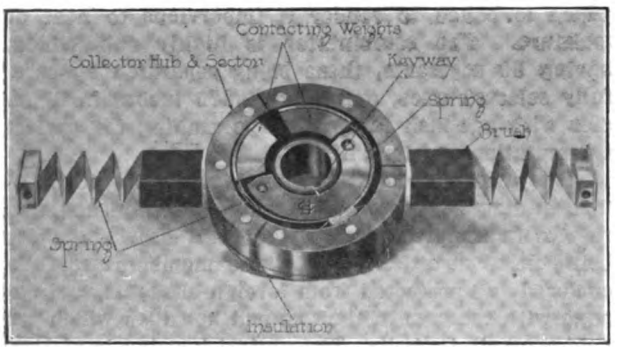

Fig. 72—Depicting Automatic Switch Operated by Centrifugal Force.—The Weights Are in Contact with Collector Ring from Which Current Flows Through Brushes.

tomatic switch which cuts in or out the battery when the speed of the dynamo falls below a stated number of revolutions. It operates on the centrifugal principle, is simple, and requires no attention whatsoever; in fact, after it is fitted to the armature shaft, it is impossible to tamper with it, as the actuating weights are enclosed and cannot be reached without disassembling the dynamo.

The simplicity of the device will be noted by its construction, which is depicted at Fig. 72. It comprises two rings, the outer being designated as the collector ring, which consists of three sections of hard drawn copper separated by mica insulation. Within the outside ring is another member, this being divided into three sectors, the largest being secured to the collector hub and carrying a spring. The two smaller sectors or contacting weights are secured to the spring which, when in normal position, prevents the weights from coming in contact with the outer sectors as depicted at Fig. 73. The bushing inside of the inner sector forms the hub of the structure and is provided with a keyway for attaching to the armature shaft, the position of the switch being outlined at Fig. 71.

Operation of Switch.

When the rotation of the armature shaft attains a predetermined speed, the weights move outward by centrifugal force, making contact with the collector ring. Current then flows through the brushes to the battery until the speed of the dynamo falls again, when the weights assume normal positions, breaking the contact. It is claimed that the contact is made and broken instantaneously and that after exhaustive tests on the bench and motor cars it was found that the switch was positive in its action, this being due to the design of the spring and the fact that the member was not in constant service.

Temperature of Dynamo.

The end plates are of open pattern fitted with screens and a small ventilating fan is mounted on the shaft. Since this feature of the design was adopted, however, the losses and consequent heating have been so greatly reduced as to make complete enclosing of the dynamo entirely practical.

In a heat and break-down test conducted recently by an automobile manufacturer and lasting 10 hours, it is stated that the chart showed that in the heat run the generator carried 12 amperes at 2100 revolutions a minute and that the maximum temperature was 132 degrees Fahrenheit, while that of the room was 72.

The commutator and collector are very accessible, a hinged cover on the top or front part of the dynamo being fitted for inspection purposes, and the armature may be taken out easily if desired without disturbing the wiring connections. It is pointed out by the maker, however, that each machine is carefully assembled and tested, and aside from lubrication will not require any attention from the user.

Installation and Drive.

Another feature of the dynamo is that it may be driven in either direction, and that each end of the armature shaft is provided with keyways, these being in perfect alignment, so that when the installation includes driving the magneto from the dynamo shaft, timing of the ignition is made easy. Drive may be by V belt or silent chain, but a direct drive from pump or magneto shaft should be secured where possible. To provide for the various motor constructions, dynamos are wound for engine speed drive, also 1.5 times engine speed drive for four and six-cylinder cars respectively. This rule applies in all cases where drive is from the magneto shaft, but if the dynamo connection is driven in any other way some care should be exercised to determine its speed in relation to the engine that the best selection of the two types may be made. Some variation from the ratios given is permissible.

Simplicity of System.

The simplicity of the system is depicted by the wiring diagram shown at Fig. 77, which makes provision for a group of lights, including two head, two

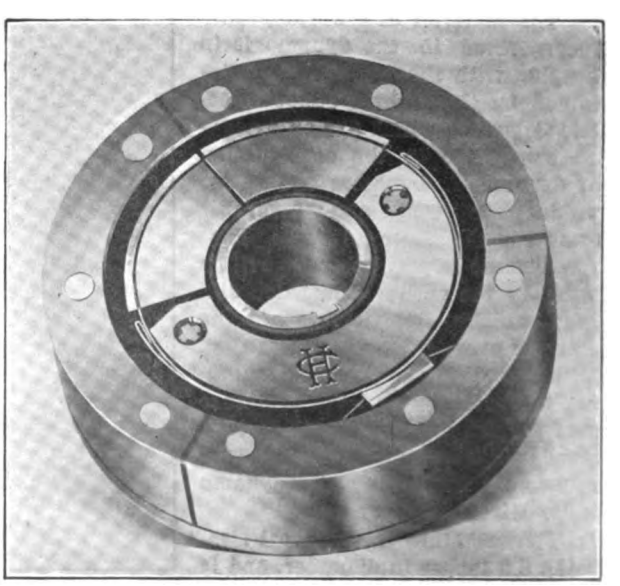

Fig. 73—Showing Automatic Switch with Contacting Weights Held in Normal Position by Spring.

Digitized by Google

side, tail and dash lamps, also an electric horn operated by push button. All wires are led to a junction box which is numbered 1, 2, 3 and 4, respectively, the functions of these being outlined in the drawing. The No. 4 switch is utilized to disconnect the dynamo during daylight driving, being installed only in the event a battery of low capacity is employed.

The lamps utilized with the Holtzer-Cabot lighting system are six-volt Tungsten, and a lamp load equal to 60 candlepower is entirely satisfactory. Bulbs of 16 candlepower are employed with the headlights and four or six candlepower for the side and tail lamps. The company recommends the use of 5.5-volt bulbs with the headlights, claiming that greater efficiency is obtained thereby, and although these members may not be generally carried by electrical supply houses, the six-volt, 20 candlepower lamps will give practically the same results.

Battery.

In designing the system, it is pointed out that its success is due in a measure to the fact that the solution of a battery of the proper size will not heat up or

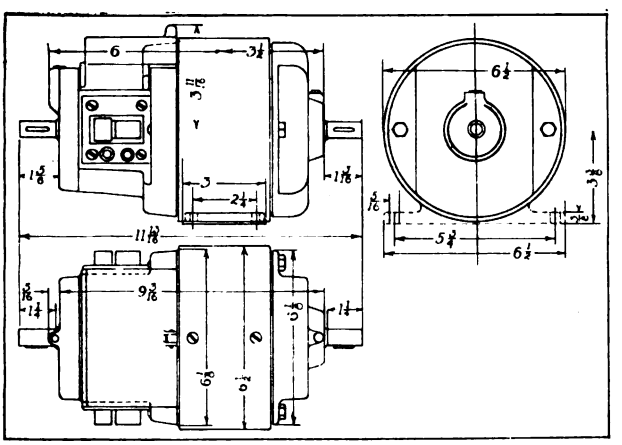

Fig. 74—The Dynamo Is Very Compact as Will Be Noted by Outline Dimension Diagram.

boil when being charged on a motor vehicle. This is attributed to the constant agitation of the electrolyte, also to the intermittent charging periods. Continuous charging does not hold true of the battery charged by a dynamo operated by the energy of the motor car.

It is also maintained that the selection of a battery is a very important factor in the lighting problem and to prevent excessive straining of the plates and causing a high rise in voltage (gas voltage) on the battery, the company uses and recommends cells having 120 to 150 ampere-hour capacity. The charging current of the dynamo is then selected and always maintained below the rated or normal charging current indicated by the maker.

The dynamo current in connection with the Edison battery is approximately 16 amperes, maximum, while the normal charging rate is 24 amperes, minimum. The dynamo current for the 150 ampere-hour Elba battery is approximately 12 amperes, maximum, while the stated charging rate is 15 amperes, maximum.

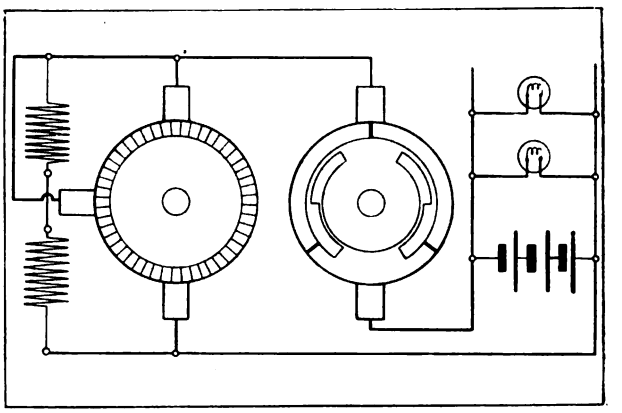

Fig. 75—Diagram of Circuit Connections Showing the Simplicity of System.

The Holtzer-Cabot Electric Company states that it has found by experience that the larger current output of its dynamo is absolutely necessary, but emphasizes the fact that it is always below the rated maximum charging current of the battery. This, it is stated, keeps down the temperature of the electrolyte, and insofar as lead batteries are concerned, prevents deterioration of the plates. The use of the B-6, 120 ampere-hour Edison battery is recommended by the company because of its design, as it may be left indefinitely in a charged or discharged condition without affecting its efficiency, and because of its long life is held to be more economical in the end. Any good acid battery may be employed, however, the make being optional with the purchaser.

Current and Speed Characteristics.

The current and speed characteristics of the dynamo are given in the chart depicted at Fig. 76 and it will be noted that the dynamo is cut in at 300 revolutions a minute, and that the rise in amperage is steady being held at the desired amperage at medium or excessive speeds.

In this instance the dynamo was driven at crankshaft speed which is satisfactory either with a four or six-cylinder motor. When driven at 1.5 times crankshaft speed the voltage showed six volts at 325 revolutions a minute of the armature shaft, and that at medium or high speed the voltage was held steady,

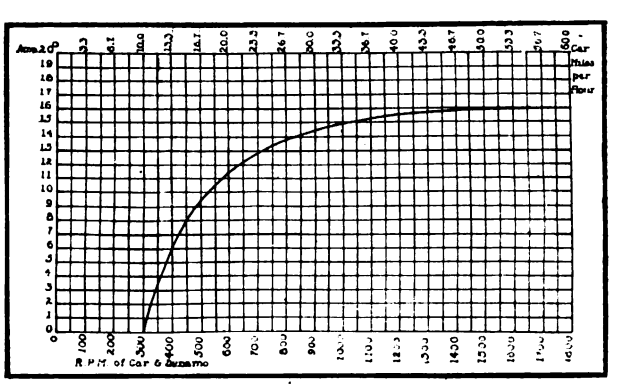

Fig. 76—Characteristic Curve of Dynamo Cut in at 10 Miles an Hour and Operating to Car Speed of 60 Miles.

Digitized by Google

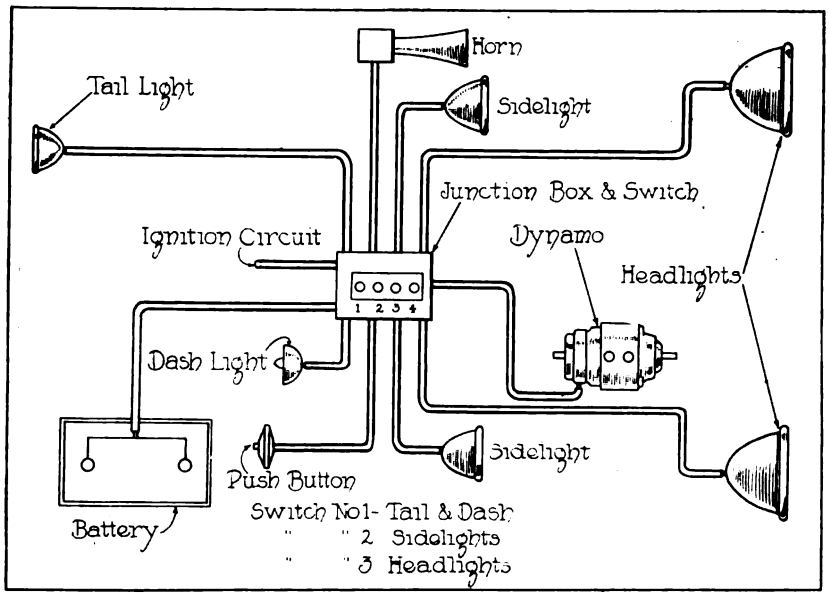

Fig. 77—The System Is Installed Easily, as Will Be Noted by the Wiring Diagram, and Wires to the Battery May Be Connected Without Regard to Polarity.

and without lamp loads was always under seven volts. The voltage and current characteristics of the dynamo with an Edison four-cell B-6 battery with lights burning and aggregating 48 and 60 candlepower shows but little variation, it being very steady. Tests with an Elba battery resulted similarly.

The Holtzer-Cabot dynamo lighting system will appeal to the discriminating motorist who desires a high grade, efficient, simple lighting system, one that will provide excellent service at all times, irrespective as to whether the automobile is operated more continuously in the day or night.

CALIFORNIA BANNER STATE.

Regarding the growth of the automobile industry in California, V. A. Longaker, general manager of the American Motors Company, Indianapolis, Ind., has prepared some figures of interest. According to him there is one automobile license number for every 30 inhabitants of the state. Recently the secretary of state announced that there are 75,675 machines licensed in the state. The population of the state in 1910 was 2,377,549. New York, with a population of 9,113,279 in 1910, recently reported having reached the 75,000 mark. Mr. Longaker, says:

"Placing the average cost of the automobile at $1200 (if you want to, you are privileged to scale down or up on this figure) those 75,675 California licenses mean an expenditure of $90,810,000. These statistics do not include motorcycles, ever increasing numbers of which are being sold to those who cannot afford a four-wheeler. Farmers are largely investors in motor cars now according to the licenses issued. Especially are they buying gasoline trucks for the multifarious activities of the ranch."

PERFEX MAKES APPEARANCE.

The Perfex car, designed and built under the direction of James Fouch, and made by the Perfex Motor Car Company of Los Angeles, Cal., recently made its appearance on the Pacific Coast. Considerable ceremony attended the introduction of the first car to the public, H. B. Gurley, assistant secretary of the Los Angeles chamber of commerce, breaking a bottle of Owens river water over the radiator as it left the factory. Several prominent easterners are said to be interested in the new concern, including Paul Brown, a broker and member of the New York exchange.

CORBIN IN NEW FIELD.

New Britain Concern Announces Its Entrance into Manufacture of Speedometers.

Announcement has been made by the Corbin Screw Corporation, a division of the American Hardware Company, New Britain, Conn., that it will manufacture and place on the market the Corbin-Brown speedometer. The device has been known as the Brown speedometer, but under the new name will embody a number of invaluable features.

The Corbin-Brown instrument is the invention of Col. W. C. Brown of New York City, who will be sales manager of the speedometer department of the Corbin Screw Corporation. The advent of the Corbin concern into this field is significant because of its large capital, assets, and distributing branches and sales forces in New York, Philadelphia, Chicago and San Francisco.

STEWART TRUCK COMING.

Recently Organized Buffalo Concern Makes Announcement Relative to Its Product.

The new Stewart Motor Corporation, Buffalo, N. Y., recently formed by T. R. Lippard and R. G. Stewart, who withdrew from the Lippard-Stewart Motor Car Company, has secured the big plant recently vacated by the Niagara Machine & Tool Works at the corner of Randall and Superior streets, Buffalo. It will be put into condition for occupancy at once, orders for machinery, equipment, etc., now being placed from the temporary offices of the concern at 1056 Ellicott square. Every effort will be made to start manufacture at the earliest possible moment, so as to fill orders already received for early fall delivery.

The new company will manufacture light trucks. Mr. Lippard is president and general manager; Mr. Stewart, vice president and chief engineer; R. P. Lentz, for several years connected with the London & Lancashire Fire Insurance Company of Hartford, Conn., secretary and treasurer, and Robert W. Ingersoll, recent manager of the Firestone Tire & Rubber Company of Buffalo, sales manager.

The new product will be known as the Stewart truck, being named after Mr. Stewart, who also was the designer of the Lippard-Stewart truck. Automobile men who are acquainted with the designs of the new product, proclaims it ahead of anything that has ever been placed upon the market, and say it is bound to meet a ready sale.

PRESIDENT JAMIESON DEAD.

Head of Abbott Motor Company Succumbs in Pennsylvania Home After Long Illness.

Charles W. Jamieson, president of the Abbott Motor Company, Detroit, died at his home in Warren, Penn., early in the month, after an illness lasting over a year. He had been kept to his bed since last December. A short time ago strong hopes of recovery existed, and the announcement of his death came as a distinct shock to the industry. The management and future plans of the company will in no wise be affected, it is announced.

Mr. Jamelson became a heavy stockholder in the Abbott company on its reorganization two years ago. He was made president and had been one of the chief instruments in its development. His financial resources were large and he employed them freely in the Detroit enterprise. He was one of the largest independent oil refiners in the country; was president of the First National bank of Warren, and was heavily interested in mining and manufacturing.

For the past seven months the affairs of the Abbott company have been directed by F. M. Knapp of Warren, one of the directors, who will continue in charge.

NEW OLDSMOBILE HEAD.

Oliver C. Hutchinson Leaves Marquette Company to Succeed W. J. Mead.

With the announcement that W. J. Mead, vice president and general manager of the Olds Motor Works, Lansing, Mich., had resigned to become president of the reorganized Amplex Motor Car Company, Mishawaka, Ind., came the information that Oliver C. Hutchinson, formerly head of the Marquette Company, Saginaw, Mich., had been promoted to succeed him.

Few men in the industry are better known to the trade throughout the country, but his most signal success has been in connection with the Marquette company, the product of which may be considered as one of the newest of the General Motors Company, having been placed in the market last year. The plans put under way by Mr. Hutchinson have caused this car to become as thoroughly entrenched as many of the older machines.

O. C. Hutchinson, General Manager, Olds Motor Works.

In connection with the promotion of Mr. Hutchinson, comes the statement that interesting announcements concerning the Oldsmobile line for 1913 may be expected in the near future when Mr. Hutchinson becomes thoroughly acquainted with his new duties.

WILLYS-GARFORD COMBINE.

President of Overland Concern Adds Garford Company to His Present Holdings.

The agreement between the Willys-Overland Company, Toledo, O., and the Garford Company, Elyria, O., whereby the former has marketed the products of the latter, was dissolved recently, and John N. Willys, president of the Willys-Overland Company, took over the controlling interest in the Garford company. Following the disposal of his interests, Mr. Garford sailed for Europe in company with M. D. Johnson of Cleveland, O., his attorney and business adviser.

Mr. Willys has been elected president of the Garford company, and George W. Bennett vice president, these being the positions thy hold in the parent Willys-Overland holding company. Vice President Bennett plans to spend one day a week at the Garford plant, as well as a day a week at the Gramm Motor Truck Company's factory in Lima, O., which recently also was secured by the Willys interests.

AUSTIN ADDS CAPITAL.

Maker of Well Known Car Reorganizes in Order to Increase Production Facilities.

Plans are under way for a reorganization of the Austin Automobile Company, Grand Rapids, Mich. For the past 10 years, James E. and Walter S. Austin, father and son, have conducted the business and have manufactured in limited quantities one of the most imposing cars that have come out of the West.

George H. Davidson and William R. Shelby of Grand Rapids have become interested with the Austins, and a $500,000 corporation will be organized. Of the capital, $300,000 will be represented by common stock and $200,000 by six per cent. preferred. It is planned to make the Austin product a greater factor in the automobile field than heretofore.

PREST-O-LITE PATENT.

Illinois Judge Makes Important Ruling Affecting Product of This Concern.

Justice Kohlsaat of the United States district court for the northern district of Illinois, has decided that the patent of the Prest-O-Lite Company of Indianapolis, Ind., is dead, despite the fact that seven United States district courts and one United States circuit court of appeals have decided that it is still entitled to a lease of existence for some five years. His decision was rendered in the action brought by the Prest-O-Lite people against the Searchlight Gas Company of Chicago, sustains his denial of a preliminary injunction, and until the case is fought out in the court of appeals, gives the Searchlight company the right to continue its business as heretofore, within that judicial district.

The line of suits hinges about a point of patent law. Prior to 1897 the statute held that a foreign patent taken out in the United States expired at the same time as the foreign patent, but the law was amended in that year. The application for the Claude & Hess patent, under which the Prest-O-Lite Company has manufactured its product, was made before 1897, but was not granted until Dec. 25, 1900. The English right officially expired June 30, 1910. The English and American patents are somewhat similar. The defense has contended that the Prest-O-Lite patent is the same as the English grant, and since application was made prior to 1897 it has expired. The Prest-O-Lite contention, which has thus far been upheld, is that the English grant covers a "process," while the American covers an "apparatus."

COLE SALES DEPARTMENT.

Absorbs Henderson Selling Organization and Promotes Several Members.

Following the announcement a short time ago that the Cole Motor Car Company, Indianapolis, Ind., had absorbed the Henderson Motor Sales Company of the same city, came the news that Charles P. Henderson, who was at the head of the sales company, had been made general sales manager of the Cole company. H. C. Lathrop, who was secretary and treasurer of the sales company, is to have charge of the Indianapolis branch of the Cole company, with a large allotment of territory.

The large organization that surrounded Mr. Henderson and assisted him in the general success of the sales company, goes bodily to the Cole company, some advancements being made. Edward Harris, who was in charge of the promotion department, moves to the position of assistant sales manager; Jay D. Riker, who comes from the Parry Buggy Company, takes the promotion department; John A. Murphy, cashier of the sales company, becomes assistant secretary of the Cole Motor Car Company; E. E. Rogers remains in his same post; Homer McKee is advertising director; H. C. Bradfield takes the road as travelling newspaper consultant, while Harlow Hyde, a new man, has been taken on in charge of the detail work in the advertising department.

DUQUESNE CAR COMING.

Pittsburg Capitalists Organize Concern Which Will Locate in That City.

The Duquesne Motor Car Company, a close corporation, financed by a small number of leading business men in Pittsburg, Penn., has been formed, and will begin the manufacture of pleasure cars in the Pennsylvania city. About 250 men will be employed at the beginning, and it is planned to manufacture 500 pleasure cars as the first year's output.

Early in the campaign for the formation of the new company, the Industrial Development Commission of Pittsburg called attention to the fact that 45 per cent. of all the raw material used by automobile manufacturers was made in that city, and but few automobiles were manufactured there. The commission also called attention to the fact that the topography of Pittsburg would insure satisfactory results from any car that could withstand the tests made there. As a result of the commission's efforts the new concern was organized.

W. L. Rodgers, president of the Pittsburg Gage & Supply Company, is president. Oscar J. Howick, formerly designer for the Lozier Motor Company, Detroit, and Frank H. Morse, the engineer who developed the KisselKar, are associated with the new company, the former as designer and the latter as engineer. The company has established its plant at 30th and Liberty streets, where it occupies a floor area of 60,000 square feet.

The first model will be a four-cylinder, five-passenger car with 50 horsepower Wisconsin motor of the T head type. It will be equipped with an electric self-starter and electric lights. Designs are also being made for a six-cylinder, seven-passenger model. The company proposes to enter the field in the fall. The product will be known as the "Duquesne," and the trade mark will be the seal of the city of Pittsburg, enamelled in the colors of the city, black and orange.

The Duquesne Motor Car Company has a present nominal capitalization of $25,000, which will be shortly increased to $250,000. R. F. Rampsey of Pittsburg is the treasurer.

NEW GRAMM COMPANY.

Close Corporation Formed with Capital of $500,000 to Manufacture Trucks.

B. A. Gramm, who a short time ago retired from the Gramm Motor Truck Company, when John N. Willys, president of the Willys-Overland Company, Toledo, O., took over the former company, has become associated with M. Bernstein, a very wealthy and successful manufacturer in Lima, O., in a new corporation to be known as the Gramm-Bernstein Company. The capital stock of the new concern is $500,000, of which $300,000 is common and $200,000 preferred.

Fred Biszantz, designer and general superintendent, formerly with the Gramm company, and one of the best known men in his line in the country, is to be with the new organization. Mr. Bernstein, formerly a director in the Gramm company, is president; H. O. Bentley is secretary, and Mr. Gramm is vice president and general manager.

An excellent plant has been purchased in Lima. Additions are now under construction, which, when finished, will give a total of 125,000 square feet of floor space. The building is all of one story, steel constructed, with the most modern lighting system. Everything is light, airy and sanitary. The structures are located on the main line of the Pennsylvania and D., T. & I. tracks, providing the best facilities for shipping. Concerning the new company, Mr. Gramm states:

"We have been working up the business, and, no doubt, the country will expect the best trucks on the market from us, owing to our great experience in this business, having specialized in it for years. We are placed in a position where we have nothing to hold us back from producing the best. Already half of our next year's output is spoken for. Our aim is to build every truck a masterpiece, and produce the trucks in such a way that they will themselves become our best salesmen."

ANOTHER BIG CONCERN.

W. C. Durant Said to Be Moving Spirit in $65,000,000 New York Corporation.

W. C. Durant, active head of the Little Motor Car Company of Flint, Mich., and of the Chevrolet Motor Car Company, Detroit, is said to be the principal moving spirit in the Republic Motor Company, recently formed in New York City with a capital stock of $65,000,000. It is claimed that the new concern is to build large factories in 10 of the leading cities of the country, which will serve as assembling plants for the Little and Chevrolet companies.

Quarters for the first plant in the long string were recently secured in New York, when the factory formerly occupied by Rothschild & Co., automobile body builder, which occupies the entire block front on 11th avenue, between 56th and 57th streets, was secured. R. L. Losey, who recently resigned his position as manager of the Indianapolis branch of the Buick Motor Company, is now in New York where he has a position as sales manager for the new Republic company.

PLANS FOR EXPANSION.

Republic Rubber Company Intends to Increase Capital Stock to $10,000,000.

Directors of the Republic Rubber Company, Youngstown, O., recently authorized the calling of a stockholders' meeting to be held early in August for the purpose of increasing the capital of the company from $4,000,000 to $10,000,000. The capital after the increase will consist of $6,000,000 common and $4,000,000 preferred.

No definite announcement has been made as to the amount of additional capital to be issued this year. It is understood, however, that the growth of the business will require new funds before another season.

The directors have also authorized the construction of a large modern reclaiming plant, which, with the completion of the five-story building now in course of erection, will give considerably greater capacity.

LONG OVERLAND TRIP.

Thirty Reo Enthusiasts from Iowa Visit Michigan Plant to Secure Their Cars.

Owing to the unexpected demand for Reo the Fifths, made by the Reo Motor Car Company, Lansing, Mich., the general sales agent, R. M. Owen & Co., of that city and New York, has been experiencing difficulty in securing shipping facilities for making deliveries as rapidly as purchasers would desire. Many new owners have felt compelled to visit the factory in order to take possession of their cars. An accompanying illustration shows 30 Reo enthusiasts thus employed.

Party of Reo Enthusiasts Leaving the Factory in Lansing, Mich., on Novel Overland Trip.

Early in the month R. M. Owen & Co., received a telegram from its representatives in Fort Dodge, Ia., conveying the information that 30 residents of that city were on their way to Lansing and had planned to drive their Reo the Fifths over the road to Fort Dodge. By special arrangements they were able to cure the 15 cars required and the homeward trip was begun.

The return route was by way of Grand Rapids, where the Reo caravan was entertained by W. D. Vandecar, the veteran local dealer. Thence the way led through Grand Haven, Chicago and the transcontinental route to Fort Dodge. The 600-mile trip was made without the slightest mishap to cars or passengers, and this is believed to be the first instance on record where so large a number of motorists has gone such a distance from their homes to an automobile factory in order to insure the receipt of their cars.

FEW GOOD ROADS.

Noted British Highway Enthusiast Makes Interesting Comment on American Conditions.

Lord Montagu of Beaulieu, Eng., editor, and an enthusiastic motorist, recently returned to New York City from a several weeks' trip through the Middle West, the middle Atlantic states and Canada, where he made an exhaustive study of American roads and methods used in American road building. That the United States has plenty of automobiles, but comparatively few good highways is his opinion, expressed just before he was preparing to leave for his home country.

He commends the generous appropriations for road building in this country, but claims a mistake is made in that practically no provision for their maintenance is provided after they are once constructed. He points out that in England there is a regular maintenance tax laid upon the road users, and suggests the same idea for this country. He says that there are hundreds of foreign tourists who would come to America every year to enjoy the beautiful scenery, but for the fact that the roads generally are poor. He claims that if the travelling were good, foreigners would be willing to pay a tax of $1 for every 50 miles while touring here.

The best roads he encountered while on this side, he said, were in and around New York City, Boston, Mass., and Washington, D. C.

NEW YORK SHOWS.

Automobile Board of Trade Completes Plans for Two Exhibitions Next January.

At a recent meeting of the Automobile Board of Trade in New York City extensive plans were considered for the January automobile show, which will be conducted in two buildings—the new Grand Central Palace and the Madison Square Garden, with a single admission to both. It was definitely decided to open the demonstration the evening of Jan. 11, 1913, with an exhibition of pleasure cars in both buildings, continuing until Jan. 18. The commercial vehicle display will also be held in the two buildings and will follow that of pleasure cars, opening Jan. 20 and closing Jan. 25.

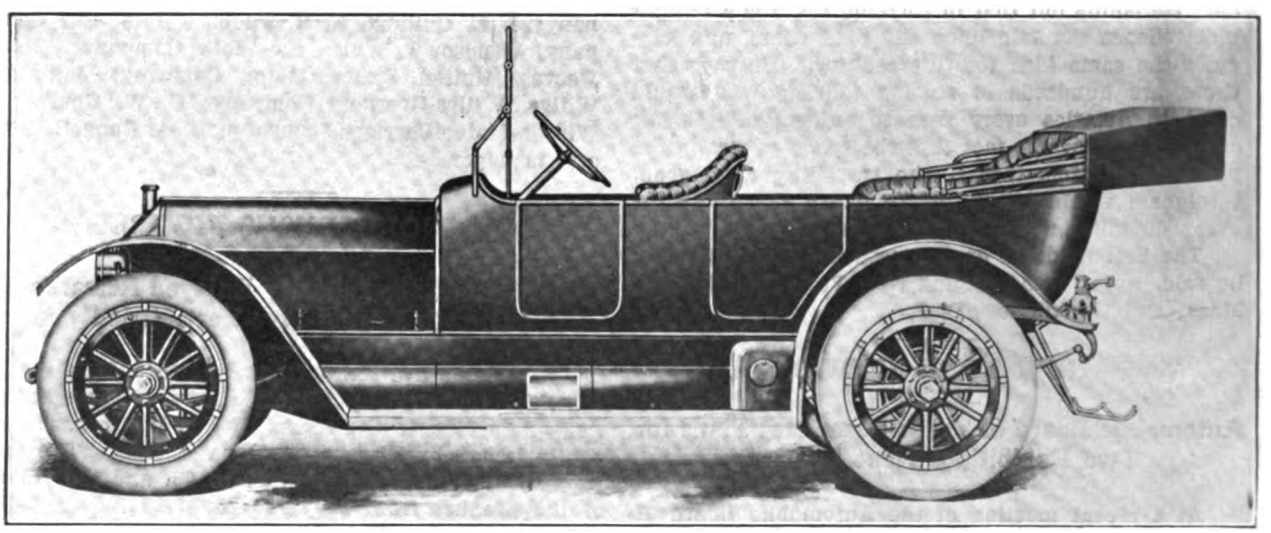
Resolutions were passed on the death of Alfred N. Mayo of the Knox Automobile Company, one of the oldest members of the board, and a leader in the automobile industry since its inception.

Those present were: M. L. Downs, Autocar Company; W. C. Leland, Buick Motor Company, Cadillac Motor Car Company, Cartercar Company, Elmore Manufacturing Company, Marquette Company, Oakland Motor Car Company, Olds Motor Works, Rapid Motor Vehicle Company, Reliance Motor Truck Company; Hugh Chalmers, Chalmers Motor Company; James C. Dryer, James Cunningham Son & Co.; G. H. Stilwell, H. H. Franklin Manufacturing Company; G. W. Bennett, Garford Company; E. W. Headington, Haynes Automobile Company; E. H. Broadwell, Hudson Motor Car Company; Howard M. Davis, Knox Automobile Company; W. S. M. Mead, Lozier Motor Company; W. C. Shepherd, Matheson Automobile Company; William T. White, Mercer Automobile Company; William E. Metzger, Metzger Motor Car Company; James M. Cram, Mitchell-Lewis Motor Company; W. H. VanDervoort, Moline Automobile Company; E. J. Moon, Moon Motor Car Company; George M. Dickson, National Motor Vehicle Company; C. C. Hanch, Nordyke & Marmon Company and Premier Motor Manufacturing Company; M. J. Budlong, Packard Motor Car Company; L. H. Kittredge, Peerless Motor Car Company; Charles Clifton, Pierce-Arrow Motor Car Company; George Pope, Pope Manufacturing Company; Oscar Stevenson, Pullman Motor Car Company; F. B. Stearns, F. B. Stearns Company; J. E. Quimby, E. R. Thomas Motor Car Company; Windsor T. White, the White Company; Alfred Reeves, United States Motor Company; John N. Willys, Willys-Overland Company; C. W. Churchill, Winton Motor Carriage Company; H. A. Bonnell, general manager.

ILLINOIS CENSUS FIGURES.

Report Shows the Industry Enjoyed Remarkable Growth During Five-Year Period.

During the five years, from 1904 to 1909, the automobile industry in Illinois shows a remarkable gain, according to the report of the 13th census recently issued by Director E. Dana Durand. The establishments increased from 12 to 65, and the value of the product from $357,000 to $7,154,000. The number of people employed in 1904 was 167 and in 1909, 2382. The following tables give comparative figures that show the growth:



State of Illinois.	1904.	1909.
Number of establishments	12	65
Persons engaged	192	2,804
Proprietors	8	41
Salaried employees	17	381
Wage earners	167	2,382
Primary horsepower	136	1,786
Capital invested	$401,000	$4,084,000
Salaries paid	28,000	426,000
Wages paid	107,000	1,653,000
Cost of materials	112,000	3,979,000
Value of products	357,000	7,154,000
Value added by manufacture	245,000	3,175,000
City of Chicago.		
Number of establishments	11	41
Persons engaged	190	1,725
Proprietors	7	17
Salaried employees	17	248
Wage earners	166	1,460
Primary horsepower	....	734
Capital invested	$399,000	$2,094,000
Salaries paid	28,000	305,000
Wages paid	106,000	1,131,000
Cost of materials	111,000	1,707,000
Value of products	354,000	3,940,000
Value added by manufacture	243,000	2,233,000

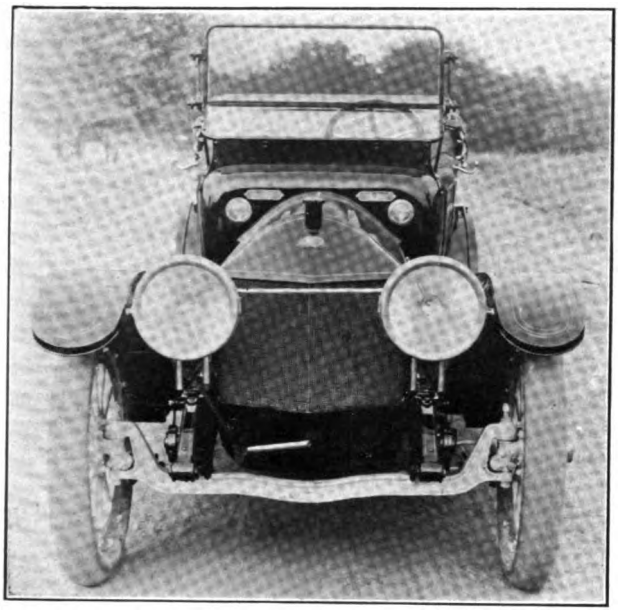
Digitized by Google

NEW SIX-CYLINDER IN 1913 KNOX LINE.

THE announcement of the Knox Automobile Company, Springfield, Mass., of the pleasure cars that it will produce for the 1913 season is to the effect that the three models built for 1912 will be continued, with certain refinements, and that there will be a new production, known as model 46, a six-cylinder machine of 46 horsepower, S. A. E. rating, which will have a distinct innovation in radiator and hood design.

Model 46 will have a somewhat unusual appearance, which will give a racy effect, and yet it will not be sufficiently pronounced to create adverse comment. As viewed from the side or from the front the sloping radiator, which will have a rather longer head and a slightly peaked or cone appearance, will attract decided attention. It will have all the Knox features and, of course, the expectation is that it will meet with a large measure of approval from motorists.

Model 46, the 46 Horsepower Six-Cylinder Chassis Added to the Knox Automobile Company's Line for 1913, 130-Inch Wheelbase.



The model R becomes model 44, model R-45 becomes model 45, and model S, the 60 horsepower six-cylinder, becomes model 66. These chassis are furnished with the varying types of bodies built by the company. The finish is up to the Knox standard and the equipment with each is complete, though this may be varied at the purchaser's option.

The following description will deal particularly with model 46, but it will be understood that this can be applied generally to all the other chassis. The motors of the other models have the same bore and stroke, five-inch bore and 5.5-inch stroke, aside from wheelbase and tires with variance of chassis length and wheel proportions, and some minor details. Emphasis is placed upon the fact that Knox machines have been continued with few modifications, this being regarded as practical demonstration of the stability of construction and the soundness of the engineering principles on which the chassis were designed. In addition to the refinement of the chassis the bodies have been perfected and it is maintained that these are more than ever entitled to commendation as work of the highest class.

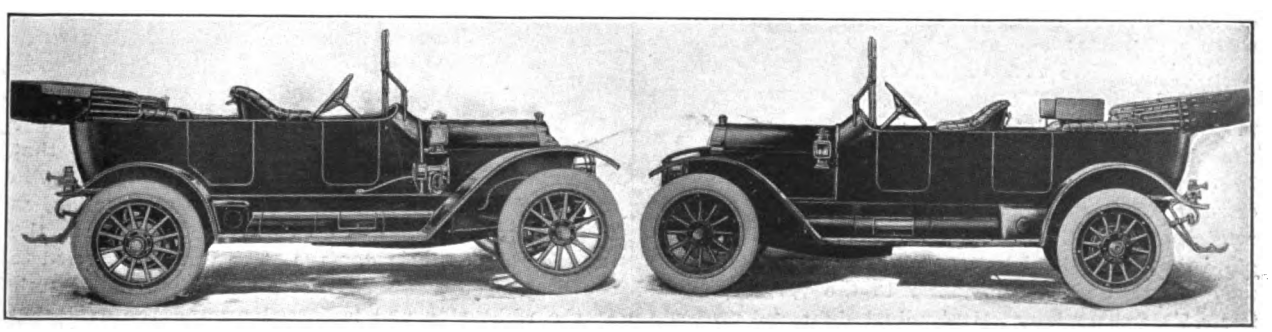
The motor of model 46 is six-cylinder, water-cooled, and is with a bore of 4.375 inches and stroke of 5.5 inches, this being a bore to stroke ratio of one to 1.257, and the longest stroke motor (in ratio) ever built to Knox design. The rating by the S. A. E. formula is 45.9375, so it will be seen that the claim of 46 horsepower by the maker is decidedly conservative. The probabilities are that the power will closely approach 60, at maximum speed. The power plant is of the well known Knox unit design, in which a large yoke carries the exposed flywheel and clutch, and supports the gearset case in the transmission, so that while the assembly may be removed from the chassis as a unit, it is also practical to take out either the flywheel or the clutch without disassembling the engine or the gearset. The entire power plant may be removed from the chassis by the removal of four bolts, one at either side of the yoke at the rear, and the two trunnion bolts in the centre of the forward cross frame member. Besides this it is necessary to uncouple the forward universal joint, the exhaust pipe connection, the wiring of the ignition system and the throttle and brake connections, a comparatively simple process.

The cylinders of the six-cylinder motors are cast in pairs, these being of a superior quality of fine gray iron. They are of the I type, so-called, being plain cylinders with the water jackets integral. The water jacket spaces are large and extend practically the full

Digitized by Google

Model 46 Head-On, Showing New Design of Radiator, Dash and Front Axle, All Characteristic of This Machine.

length of the expansion chamber. The heads are cast separately and these are with the water jackets integral, the water chambers being divided by a horizontal web extending nearly the entire width of the head. The pistons are of the same material as the cylinders and heads.



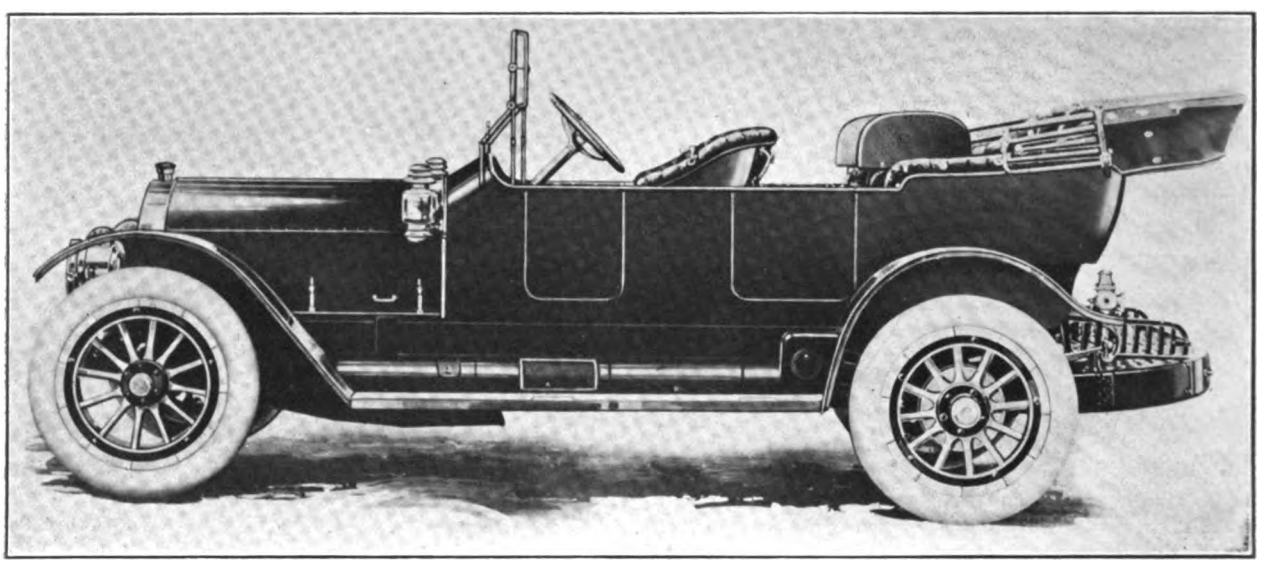
The cylinders are bored and aged, after which they are reamed, ground and polished, purpose being to eliminate any roughened surface to which carbon deposits might adhere. The heads are quite as carefully machined and finished. The cylinder casting is machined with a deep groove encircling the unit and the head is machined with a tongue that exactly fits the groove, so that with a copper asbestos gasket fitting the groove when the cylinder head is drawn down to the cylinder by the heavy retaining bolts a perfect gas tight joint is formed. The valves are carried in the head and are removed with that member, making it possible to completely clean the cylinder of carbon with comparative ease, while replacing a valve is a matter of little labor or effort.

The pistons are turned and ground to exact fit, they being channelled for four bevel-split rings of the eccentric form, three of these being fitted near the top and above the wristpin, and one close to the base of the piston. This insures a high degree of compression and a retention of a sufficient quantity of lubricant at all times.

The crankcase is a special aluminum alloy casting that has a lower or bottom section that forms the oil reservoir. This deepens at the rear of the case. The forward web carries the main bearing and there is a cover that encases the timing gears. Two transverse webs divide the case vertically, these carrying the centre main bearings. The top of the crankcase is heavy and the bottoms of the cylinders are machined to fit the openings, this affording the depth of the thickness of the crankcase below the wide retaining flanges, and making a specially firm seat for the cylinder units. At either side of the crankcase is bolted the heavy aluminum alloy arms that form the sides of the yoke supporting the clutch and transmission, two large bolts securing these to the crankcase, and between the rear ends of the yoke arms the gearset case of the transmission is bolted. About midway of the length of the yoke arms are bosses, where the yoke is bolted to the chassis frame side members. When assembled this forms a unit that is absolutely rigid and mechanically correct.

The crankshaft is a high grade alloy steel drop forging that is specially heat treated and is finished and ground to size. There are four main bearings of large size, effectually maintaining the shaft rigid and true. The camshaft is an alloy steel drop forging with the cams and the two spiral gears cut integral with the shaft. The cams and bearing surfaces are ground to exact size and the shaft is hardened. The shaft is carried in three phosphor bronze bearings, the centre bearing being in halves and designed to be taken up by filing the edges. The connecting rods are nickel steel drop forgings and the big end bearing caps are secured by two bolts at either side, with three thicknesses of shims between the bushings that adjustment for wear may be made. The wristpin end is with a solid eye into which the bushing is forced by pressure.

The main engine bearings and the connecting rod



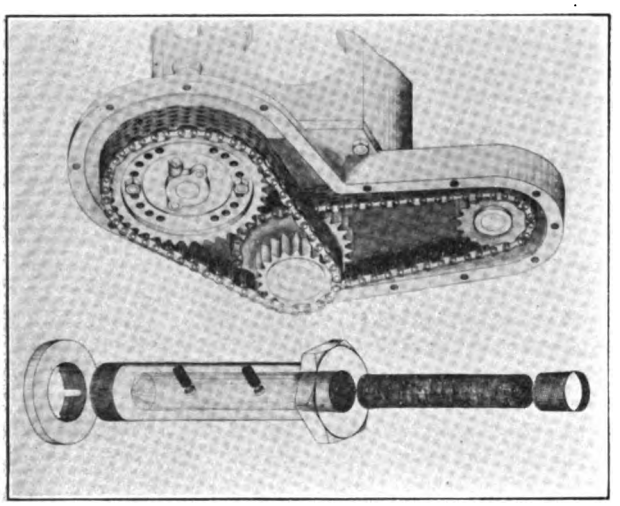
Model 44, the Smallest Powered Knox Chassis and Touring Body, 122-Inch Wheelbase.

Model 45, Fitted With a Seven-Passenger Touring Equipment, 126-Inch Wheelbase.

Digitized by Google

bearings are of special bearing metal, which are carefully scraped to a fit. The wristpins are of special steel, hardened and ground, and these are firmly secured in the piston bosses. The valve tappets are carried in guides bolted to the engine case and the rods at the base have a yoke in which is inserted a hardened steel roller that engages with the cam below. The guides are formed with shoulders to permit the yokes to lift, and at the tops of the guides are collars threaded into the guides. The ends of the tappets have hardened adjusting screws, and the lower ends of the pushrods have fittings that receive the upper ends of the tappets, with helical springs interposed between collars on the pushrods and the tappet guides, always maintaining the relation between the pushrods and the tappets and preventing noise, as the tappets and cams are always in contact. The upper ends of the pushrods have fittings with hardened cup shaped sockets which are adjustable by screws for length to vary the valve openings, the adjustment being secured by lock nuts. The rocker arms have ball shaped ends that fit into the sockets at the ends of the pushrods. The valves are of nickel steel and they are carried in large guides that may be renewed when worn. The valve springs are above the head and are adjustable for tension. The sockets at the top of the pushrods are filled with lubricant and with the springs employed there is no lost motion, little wear and an entire absence of noise. The rocker arms are lubricated by grease cups. The head of the cylinder unit is enclosed with an aluminum case that is held by the bolt retaining the cylinder head, and this is covered by a plate that is retained by two wing nuts, so that access may be made almost instantly to the valve mechanism. This cover is practically dust tight and prevents abrasive material collecting on the rods and rockers, and valves, and causing undue wear and noise.

The camshaft is at the right side of the motor and at the forward end of this is a carrier, and to this is bolted a sprocket for a silent chain. In the carrier are two rows of nine holes each diametrically opposed. Similarly the sprocket has two rows of 10 holes each diametrically opposed. There is thus a vernier adjustment, as the bolts attaching the sprocket to the carrier may be moved to give practically every desired valve adjustment without changing the sprocket chain, this being a feature that will be appreciated by every motorist. The main engine shaft extension carries two silent chain sprockets, the inner sprocket being the larger, and from this is driven the outside shaft that operates the magneto and the dynamo, the outside shaft turning 1.5 times as fast as the engine shaft. The camshaft is driven from the outer sprocket on the crankshaft and this turns at half the time of the crankshaft. This form of drive eliminates the noise that is inherent in any type of gear, either spur or spiral, and it is said to be perfectly silent under any condition of operation. Beside this timing is greatly simplified. Exceptionally wide, coarse pitch chains are used and as they are thoroughly stretched before assembly it is held that in practise they will run indefinitely without developing any serious back lash.



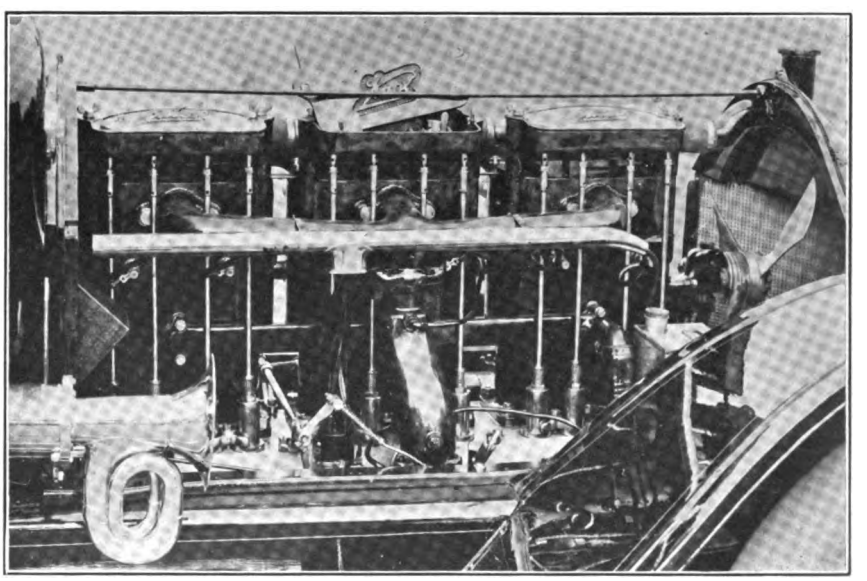
Model 66, the Largest Knox Six-Cylinder Chassis, 60 Horsepower, With a Touring Body Adapted for Seven Passengers, 134-Inch Wheelbase.

The motor is cooled by a circulation of water through the jackets and the radiator, driven by a large pump of centrifugal type, which is so designed that the rotor or impelling member of the pump will slip on the shaft in the event of a serious obstruction, as of ice formed in the pump chamber, to preserve the impeller blades from damage. The water is carried to the base of the water jackets of each cylinder unit at the right side and is forced around the explosion chamber. Thence it rises to the top and the overflow is carried by force and thermal action to the U shaped

Digitized by Google

yokes at the left side connecting the cylinder jackets with the cylinder head jackets. The water enters the lower chambers of the head, crosses them and cools

Silent Chain Drive of Knox Camshaft and Magneto Shaft, and the Detail of the Self-Lubricating Spring Bolt.

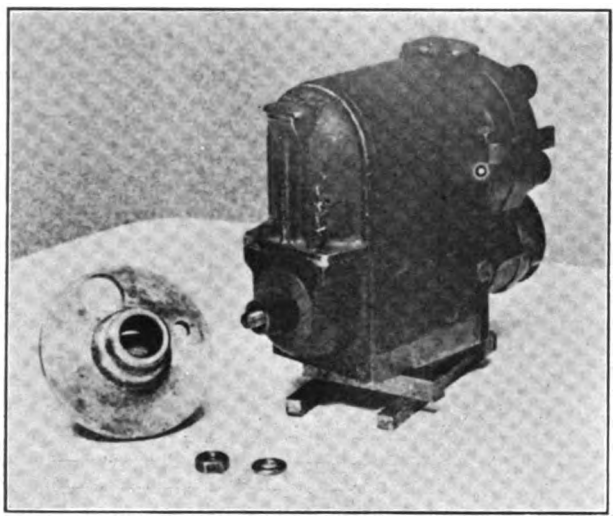


the valve chambers, and then recrosses the heads and is carried forward through flexible rubber unions between each cylinder unit and the radiator. The construction of the water connections may be noted from the illustration of the motor.

The radiator header slopes forward from the front line of the hood at an angle of about 45 degrees. Instead of the usual tubing at right angles to the chassis frame side members the radiator is coned from the centre to the sides, the angle being about 15 degrees, and it is thickest in the apex of the cone. The effect is not too pronounced and is decidedly pleasing. The illustration gives a very good idea of the construction. The water pump is driven by a spiral gear from the camshaft. There is a three-bladed fan mounted on a shaft that is carried in a bracket on the forward cylinder unit, and the wide flat belt, impervious to water or oil, may be given any desired tension by an adjustment at the bracket.

The lubrication of the motor is by an improved De Dion system. The bottom of the crankcase forms the oil reservoir and from this at the ride side is a vertical shaft driven by spiral gears by the camshaft, that actuates the rotary oil pump. The lubricant is drawn through a strainer into the oil well and forced through a main supply pipe at the left side of the engine case, and through four pipes to the main engine bearings, which are constantly flooded with oil. The crankshaft is drilled with channels from the main bearings to the wristpin bearings, and the connecting rods are drilled with channels from the big to the small end bearings. Once each revolution the oil tubes register with the channels in the crankshaft and the holes in the wristpins register with the holes in the connecting rod big end bearings, so that with each impulse of the rotary pump the channels are filled and the main, crankpin, and wristpin bearings are thoroughly lubricated. Similar leads from the main supply tube lubricate the camshaft bearings. The oil thrown off by the centrifugal motion of the shafts insures abundant lubricity for the cylinder and piston walls. The oil pump is protected in the event of an obstruction, as is the water pump impeller. A pressure gauge on the footboard registers the oil system pressure, which may be varied as desired by an adjustable spring by-pass at the left side of the motor. The oil screen may be easily cleaned when desired. The filler cap and oil level cock are at the left side. A gallon of oil will afford lubrication for at least 500 miles.

The ignition is by two complete systems, the one being with a Bosch magneto driven by an outside shaft located at the left side of the motor, with the wiring leads from the magneto to a series of spark plugs at that side, and by a battery, coil and distributor, the distributor being driven by an extension of the vertical shaft that drives the oil pump at the right side of the motor. Either one or both may be used.

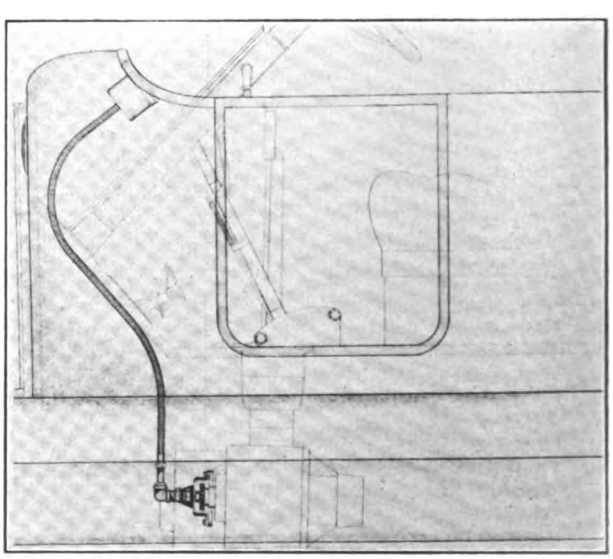


The clutch is a three-plate type with the centre plate carrying a series of cork inserts, and it is used without lubrication. Being contained in the flywheel and enclosed from dirt and water it is not susceptible

Right Side of the Long Stroke Motor of the Model 46 Knox Chassis, Showing the Water and Fuel Intake Manifolds, and the Distributor Wiring.

Digitized by Google

to the usual influences that cause slipping and wear. It is maintained to be very efficient. The gearset is of the selective type, with three forward speeds and



The Flexible Leather-Faced Coupling Between the Magneto and the Lighting Dynamo in the Knox Power Plant, That Eliminates All Driving Stresses.

reverse, and the case is secured in the yoke ends by four bolts, tongues and grooves insuring its rigidness. The shafts and gears are of nickel steel. The shafts are large and the main shaft is carried in double sets of annular ball bearings to insure against wear and side leverage pressure. The main set of driving gears are spiral cut to minimize noise in operation. The cover supporting the control lever is adapted so that either side or centre position for the lever may be obtained as desired.

There has been no change made in the driving system, this being by propeller shaft with two universal joints to the floating rear axle. The rear axle has a main differential housing of cast steel into which the axle tubes are anchored. The construction is strengthened by a strong truss rod beneath it. The shell may be opened by removing a cover plate at the rear, and the differential and the bevel gear, which are assembled as a unit in a cast steel cage, may be removed or examined. The gears are of large size and are of alloy steel, and the pinion gear and pinion shaft are of the same material. The rear wheels are mounted on imported annular ball bearings. The driving axles are of high grade alloy steel and clutches at the outer ends engage with the flange plates of the wheel hubs. The front axle is a drop forged alloy steel I section with a greater drop at the ends and less curve at the centre, this bringing the front spring correspondingly lower. The steering pivots and the axle spindles are fitted with Timken roller bearings of generous size. The wheels are an artillery type, of second growth hickory, and these are fitted with 37 by five-inch tires with demountable rims.

The springs are of a special alloy steel, those forward being 42 inches length and two inches width, and the rear springs being 54 inches length and 2.25 inches width. The forward set is semi-elliptic and the rear set three-quarters elliptic, the upper section of the rear springs being longer than in previous designs and with the forward ends scrolled, the scroll being formed to contact with a heavy rubber buffer attached to the lower half of the spring when a certain degree of deflection has been reached, this absorbing some of the shock and relieving the spring of excess strain. With previous models the forward ends of the lower halves of the rear springs were hung from the hangers by shackles, which necessitated the use of radius rods to preserve the relation of the rear axle with the chassis frame, these rods extending from the axle to the frame side members. With the model 46 design the forward ends of the rear springs are attached rigidly to the hangers and the rear ends are shackled, this permitting the drive to be through the torsion rod that parallels the driving shaft and the springs. The spring bolts are self-lubricating, being of inch diameter drilled with a half-inch channel nearly the entire length, with two small holes from this channel through one side of the wall of the bolt. The channel and the two holes are filled with felt rolls, which are saturated with oil. The outer end of the channel is closed with a plug that is screwed into the threaded end, and the compression forces the oil from the felt rolls in sufficient quantity to lubricate the spring eye for a long time and effectually prevent wear.

The steering gear is of the irreversible type, operated by a double right and left thread with a rocker

The Knox Method of Driving the Speedometer from a Gearing Attached to the Main Shaft, Securing the Mean Movement of the Traction Wheels.

action at the base, to which is secured the alloy steel rocker shaft. The column consists of two telescoped tubes, the one operating the throttle and the other

Digitized by Google

the distributor through miter gears at the lower end. Positive adjustment for wear is made by a large nut located just above the gear housing, the adjusting nut being firmly secured by a bolt and a binder collar. The bell crank shaft and the pivot levers are large and of alloy steel. The drag link is straight and the socket ends are adjustable for wear. The front end is fitted with a double acting spring that reduces the shock and prevents rattle. The tiebar is placed back of the front axle and is well protected. The steering wheel is mahogany with an aluminum spider. The control is by spark and throttle levers above the steering wheel and by foot accelerator. The foot and brake and clutch pedals are adjustable and may be operated with slight pressure. The drive may be right side or left side, with the gearset and the emergency brake levers at the side or centrally located. The service brake is an external contracting band applied by a pedal and the emergency brake is internal expanding shoes operated by a hand lever. The internal brake shoes are faced with Raybestos and are held clear of the drums by springs when not set. The brake shoes may be adjusted from the outside. The brake drums have been increased in diameter and width of face and are extremely effective.

Because of the change in the suspension the chassis frame is 1.5 inches lower than with previous models, this reducing the centre of gravity and minimizing side sway, while the clearance is unchanged.

The body design has been considerably changed in that it is wider at the front, with a less pronounced angle to the cowl, and the dash is wider and higher. Instead of ventilators in the corners of the dash these now parallel the top of the dash at either side of the hood and the dash lamps of the electric type are inset into the dash with small, corrugated lenses. The upper body line is straight and the sides of the rear seat are low. The rear seat is lowered and the width increased, and the rear doors are considerably widened at the top, this making greater convenience for the passengers entering or alighting from the car.

The lighting is by a dynamo that is mounted at the left side of the engine case and is connected with the magneto driving shaft extension by a coupling in which a heavy leather disc eliminates all noise, the connection being very efficient. The magneto shaft is made with a tapered serrated joint coupling, so that very accurate timing of the magneto is possible without changing the timing sprockets or silent chains. With the dynamo all of the lamps are lighted by electric current. There is option by which electric dash and tail lamps are lighted from a battery and gas head lamps used. The car is fitted with a Perkins starter and the gas tank is concealed in one of the boxes built into and forming a part of the skirt between the running boards and the chassis frame. The electric and gas lamps may be lighted and regulated from the driver's seat, this being a material convenience.

An innovation is the driving of the speedometer from a gear attached to the main driving shaft directly behind the gearset case, which permits the use of a short direct flexible shaft and minimizes possibilities for failure, while the reading is given as the mean of the mileage of the rear wheels. Because of the stationary and permanent nature of the driving shaft the speedometer indicator is practically free from vibration and there is no variance because of curves, this affording more accurate recording of the work of the engine, there being registration of the slip of the rear wheels.

The machines are thoroughly equipped in every sense and the upholstery and the finish are equal to the extremely high standard for which Knox automobiles have become widely known. Model 46 chassis are equipped with six and seven-passenger torpedo, two, three or four-passenger raceabout, and seven-passenger limousine and landaulet bodies. There is option of any one of 10 different colors and the upholstery may be hand buffed leather, either black or in tone to match the finish, or special fabric, and the metal work may be either nickel or brass. All the bodies are the Knox design, of aluminum and wood frames.

THE NEW MICHIGAN.

Formal adoption of the specifications for the 1913 Michigan, the product of the Michigan Buggy Company, Kalamazoo, Mich., has been made but the details are carefully guarded, as it is not the intention of the company to make announcement concerning the new car for a few weeks. The specifications are the work of Chief Engineer W. H. Cameron, who recently joined the Michigan forces, having formerly been with the Willys-Overland Company, Toledo, O.

The company authorizes the statement that the car will remain in the medium price class, although several high priced features are to be incorporated in its design. Two models will be produced, utilizing one chassis—a touring car to be known as model R and a roadster designated as model S. President F. B. Law of the company makes the following statement:

"At present we can only say that we have included a long list of features that automobile men have said could never be figured into a medium priced car. Some of these features are now used only on the famous high priced cars of America and Europe. As manufacturers on a large scale for 30 years, the problem of costs is one of long experience with us. We have solved the cost problem so many times when other manufacturers said it could not be done that we are loath to concede impossibilities in the automobile.

"It has been our ambition from the very first to bring more and more of high priced practise into the medium priced car, as represented by the Mighty Michigan. We have added something every year. But our 1913 car eclipses even our own expectations. We have a surprise—really a staggering surprise—in store."

NATIONAL CONTEST AND RACING NEWS.

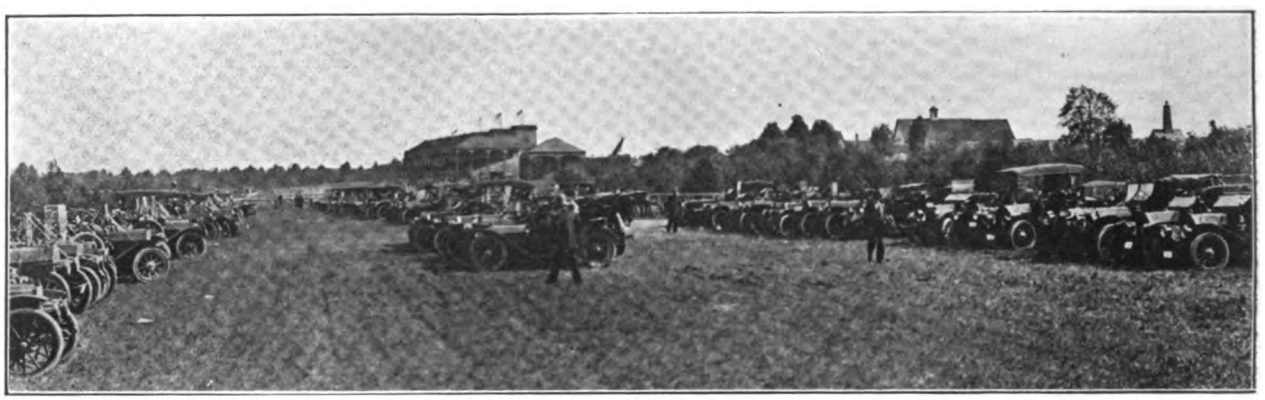
Tetzlaff Wins Twice with Fiat in Recent Tacoma Road Events---New Prizes for American Automobile Association's Annual Tour---Rockingham Park Plans---Farm and Ranch Endurance Trials---Meets in Other Centres.

Although mention was made in the last issue of The Automobile Journal concerning the results of the road racing at Tacoma, Wash., July 5-6, the dispatches were so confusing that announcement was made that additional information would be presented later. It develops that the original schedule was maintained, throughout, and that no 500-mile event was substituted, as the first dispatches would indicate.

Teddy Tetzlaff, driving the same Fiat car, with which he won the Santa Monica road race in California, May 4, and finished second in the 500-mile race on the Indianapolis speedway, Memorial Day, was twice a winner, taking the 200-mile event of the first day and the 250-mile free-for-all the second day.

Particular interest attaches to the accessories and supplies utilized on this car in these two races. As was the case in both of the previous events, the car was shod with Miller tires, made by the Miller Rubber Company, Akron, O. It was equipped with Bosch ignition, magneto and plugs, made by the Bosch Magneto Company, New York City, and it may be added that the same Dixon's graphite grease, without change or addition, was utilized in all four events. This latter result is especially gratifying to the Joseph Dixon Crucible Company, Jersey City, N. J., maker of this lubricant.

The winner of the 100-mile event was Robert Evans in a Flanders special. Poltun in a Mercer was the victor in the 150-mile race, for cars of 231-300 inches, being the only driver of the four to enter who finished. Earl Cooper in a Stutz won the 150-mile event for cars of 301-450 inches. Returning to the matter of ignition for a moment, Bosch magnetos were fitted to the cars finishing in first and second place in the free-for-all, and first, second and third in the 200-mile event. Bosch plugs were utilized on the cars finishing first, second and third in the light car race. The summary of the meet follows:



FRIDAY, JULY 5.

100 Miles, Under 231 Inches.

Car	Driver	Time
Flanders Special,	Evans	1:38:20.00
Flanders Special,	Tower	1:39:04.35
Maxwell,	Zoermann	1:42:19.50

150 Miles, 231-300 Inches.

Mercer,	Poltun	2:25:13:00

PLANS FOR ROCKINGHAM PARK.

New England and the East is decidedly interested in the plans laid by the management of Rockingham park, Salem, N. H., for another big race meet, Oct. 12. Incidentally it may be remarked that the annual Rockingham fair will be held here, Aug. 20-24, at which time it is hoped that a series of automobile races may be provided.

Digitized by Google

The park is conveniently located being within 34 miles of Boston, and within easy access of Worcester, Lynn and Newburyport, Mass.; Nashua, Manchester, Exeter and Portsmouth, N. H. The roads are exceptionally good, and already the clubhouse, a picture of which is shown herewith, has been made the rendezvous of numerous parties of motoring tourists.

The success which greeted the opening meet on this track, June 8, is expected to be repeated at the October meeting. Already several well known drivers have signified their intention of competing in the events scheduled. Arrangements are in the hands of James F. Kerr, 67 Milk street, Boston, to whom all communications should be addressed.

ADDITIONAL PRIZES FOR TOUR.

The committee having in charge the arrangements for the start of the national reliability tour of the American Automobile Association received advices recently from President Robert P. Hooper to the effect that in addition to the National, the Anderson and Glidden trophies, there would be offered a number of cups by New Orleans and Memphis people for other classes. The route has not been definitely decided upon except that Detroit, Memphis, New Orleans will be three points, with Indianapolis a possible fourth.

The tour committee at Detroit has notified the A. A. A. that Oct. 3, the original date selected for the start of the tour, in the belief that President Taft and Speaker Clark would be there for the National Good Roads Congress, is inimical to that city. The Detroiters have asked that the date be set any time after the close of the state fair in that city, Sept. 21.

The Detroit committee was regularly organized at a recent meeting, when the following officers were elected: President, Robert K. Davis; secretary, F. E. Spooner; treasurer, Leonard Davis. William E. Metzger and Howard Watrous are the other members of the committee, and another appointee from the Board of Commerce is to be made at a later date. The special committee in charge of the tour includes Col. Frank M. Joyce of Minneapolis, Lewis R. Speare of Boston, William E. Metzger of Detroit, John A. Wilson of Franklin, Penn., and W. E. Moyer of Des Moines, Ia.

PIERCE-ARROW IS FIRST.

A Pierce-Arrow car, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., was the winner of the recent reliability contest from Camden to Wildwood, N. J. The third car to finish was a Michigan, made by the Michigan Buggy Company, Kalamazoo, Mich. The distance was over a course of 108 miles in length, and more than 100 cars took part.

FARM AND RANCH TRIALS.

An accompanying illustration shows the Case car, which acted as pathfinder for the Farm and Ranch endurance run, scheduled to take place from Dallas to San Antonio, Tex., and return, July 22-27. The car was fitted with Goodyear tires, made by the Goodyear Tire & Rubber Company, Akron, O., and although it was compelled to traverse districts in which the roads were far from being of the best, no difficulty was experienced.

About 70 contestants left Dallas on the morning of July 22, the first night stop being Waco. Other controls of this nature were established at Austin, San Antonio, Taylor, Mexia and Austin. The total distance to be covered is approximately 700 miles. Several prizes have been offered by local dealers, and the entry list was open only to cars owned and operated by farmers and ranchmen.

Case Pathfinder Equipped with Goodyear Tires, Negotiating Poor Roads Preparatory for Farm and Ranch Tour in Texas.

OVER SHORTER COURSE.

The races on the beach at Galveston, Tex., Aug. 8, 9 and 10 are to be run over a shorter course this year than heretofore, this being 2.5 miles and making a full lap five miles. This will insure that the cars will pass the grand stand at more frequent intervals. In former years one criticism of the Ormond-Daytona course, about 20 miles in length, was that it was too long for the races to be exciting.

LOCK NUT WASHER HINT.

A repairman was called on to fit some form of locking device to the bolts securing the flanged extension of the flywheel of the motor to a similar member of a planetary transmission. The owner complained that lock and other types of washers worked loose. The problem was solved easily by the workman who proceeded to take a piece of .0625-inch sheet metal which he cut to the size of the locking nut.

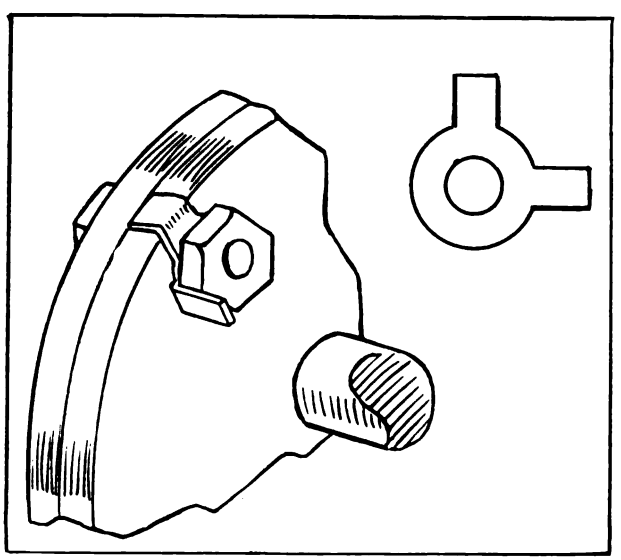

Fig. 1—Locking Device Constructed of Sheet Metal, Having Flanges to Prevent Nut from Turning.

Two arms or extensions were left on the metal and a hole drilled to fit the bolt. The device was slipped over the bolt and the nut screwed up tightly after which one of the ends of the attachment was bent over the flange of the wheel as depicted at Fig. 1, and the other projection bent to the face of the nut. This arrangement worked satisfactorily as the flange member on the nut prevented the latter from moving while the body of the washer was prevented from turning by the other extension gripping the rim of the wheel.

UNIVERSAL VISE AND SURFACE TABLE.

The ordinary bench vise has its disadvantages when handling certain parts as the workman is compelled to operate in a cramped position. Some repairmen overcome the difficulty by fitting special attachments which lighten the labors as well as save considerable time.

A vise having a universal adjustment which makes it possible to hold odd shaped as well as ordinary parts, is being marketed by the Victor Vise Company, Springfield, O., and is presented at Fig. 2 A. Angular adjustment is made possible by means of a swivelling base, and in addition the device may be raised or lowered to any convenient height. It may also be rotated about the axis of its supporting column. These various adjustments permit the workman to obtain the best light on line or prick punch marks indicating finished surfaces, as well as eliminate stooping and awkward positions.

A rigid position is secured easily by a single clamping lever and when a vertical adjustment is made, the vise is automatically held until the lever is tightened by a locking collar on the stem. The device is made in four styles and a like number of sizes.

At C is shown an accessory to the vise and this surface or table member can be mounted to the base as depicted. The plate may also be detached from the stem and utilized on the bench the same as an ordinary surface plate. They are manufactured to suit individual requirements.

SAFETY LATHE DOG.

Those familiar with the operation of the lathe have at some time had their clothing catch upon the unguarded set screw with which the ordinary lathe dog is equipped. This is especially true when filing. Elmer J. Michaud, South Windham, Conn., is mar-

Digitized by Google

keting a safety lathe dog which is so shaped that the machinist is protected. The tail of the dog is curved in front of the set screw on the leading side, this being located according to the direction of rotation. The tool is easily attached and replaced. The safety dog is illustrated at Fig. 2 B, and an ordinary member at C.

NAVALTUM, A NEW ALUMINUM.

"Aluminum ceased to be a metallurgical curiosity some 27 years ago," says the Commercial Motor. "Disappointment, however, succeeded the glowing expectations of those who first of all spoke and wrote about it. It retained its lightness but failed to meet many requirements in engineering work. Other metals and their alloys progressed in favor and use with engineers; aluminum stood still. Saved by its low specific gravity alone, its relative weakness, brittleness and liability to disintegration owing to fatigue remained inseparable drawbacks to its extended use. Certain promising alloys did not retain their initial characteristics, after a year or so had elapsed.

"A new aluminum, which is, strictly speaking, not an alloy, but aluminum treated with a flux, is about to be exploited under the name of Navaltum, by a company which has been registered in England with the title of Navaltum, Ltd.

"Ordinary aluminum is changed into a higher order of its own self with a result that is comparable to the Bessemer conversion of iron into steel. Its texture, structure and physical properties are changed while its lightness is not impaired; in fact, in some cases the specific gravity falls. The resulting metal, Navaltum, is found in its cast condition to have greater strength than the best gun metal, combined with the ductility of malleable iron. In its drawn or rolled condition, it possesses a strength nearly equal to that of mild steel, with all the annealing qualities of copper; it is not corroded by salt water or dilute acids, and does not tarnish in the atmosphere. These are the claims made for the new metal.

"Navaltum is found to cast like ordinary aluminum, brass or gun metal; no special furnace or precaution is necessary, and the castings have perfectly clean edges in the fine lines of the moulds. The breaking strain is from 16 tons upward, and the specific gravity about 2.6.

"The metal can be drawn cold, either as bars, angles, tubes or wire, as readily as brass or copper, and with no special precautions, and can be annealed in exactly the same manner. It machines as readily as any other metal, and can be quite easily worked dry. Its remarkable convenience for tooling and manipulation permits sea resisting plates and castings of Navaltum to be put together with rivets or screws of the same material, thus eliminating electrolytic action. Rivets can be made of it, and the finest threaded screws can be cut perfectly down to a diameter of .125 inch. It is thought it will prove an excellent anti-friction metal. It can also be soldered and welded. Tests made on a sheet of Navaltum, rolled down cold from a one-inch slab, without annealing, to .002 inch in thickness, gave a test of 16 tons tensile strength."

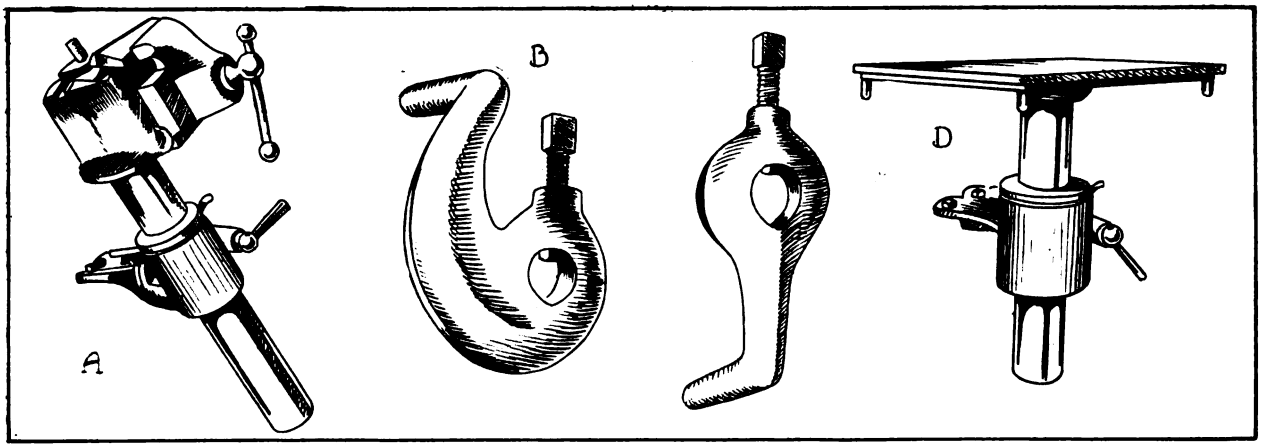

Fig. 2—Mechanical Devices of Value to the Repair Shop: A, Universal Adjustable Vise; B, Safety Lathe Dog; C, Ordinary Member; D, Surface late Utilized with Universal Vise.

CURTIS AIR COMPRESSOR.

The progressive garage or repair shop does not rely upon the manually operated tire pump, the utilization of which means a considerable loss of time. Then again, the member becomes misplaced when most needed. By having a tank of compressed air the garage is in a position to render efficient service to its customers and it really is economy as the attendant is not called upon to hunt for the ordinary member.

With a compressor it is an easy matter to keep the storage tank filled with air, ready for service. The Curtis & Co. Manufacturing Company, St. Louis, Mo., is producing an air-cooled compressor in two sizes, adapted for the public service station and private garage, these having a bore and stroke of two by 2.5 and three by 3.5 inches, respectively. The device is depicted at Fig. 3, A and B, the latter view outlining

Digitized by Google

its construction. Water-cooled types are also manufactured, these having a bore and stroke of three by 3.5, 3.5 by 3.5 and four by 4.5 inches, respectively.

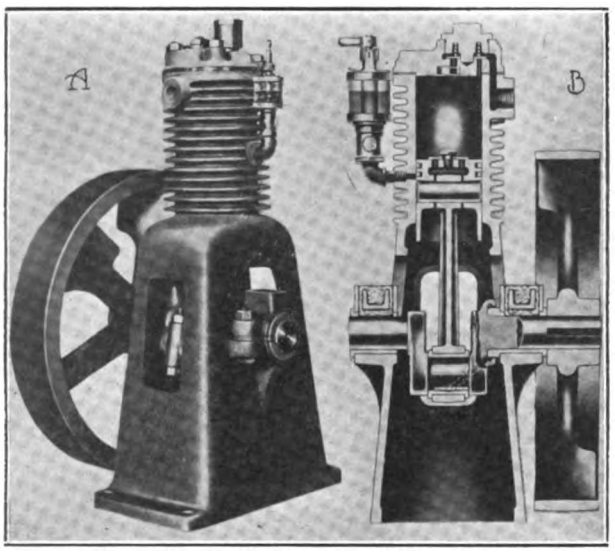

Fig. 3—Curtis Air Compressor, Made in Several Sizes, Both Air and Water-Cooled and Operated by Belt.

Either design lends itself readily for belting directly to line shaft or motor, according to its installation.

The vertical, up-plunger type of pump is employed, the maker pointing out that this construction eliminates grease or oil being carried over into the receiver and thence to the tires. Several new features are noticeable in the new compressor, these including a springless inlet valve on the piston head; fan shaped arms on the flywheel, which direct a current of air onto the cooling fins, etc. Lubrication is by a gravity feed oil cup on the side of the cylinder, the device supplying lubricant to the piston and wristpin. The crankshaft is of ample dimensions and throughout the best of material and workmanship are employed.

UTILIZING BROKEN DRILLS.

A repairman in drilling a hole broke the drill, and not having an extra one and being unable to leave the shop to secure a new one, adopted the kink shown at Fig. 5 B. A bush was made having the same diameter as the shank of the drill and the latter inserted. When placed in the chuck, the pressure of the feed held the broken ends together and the work was completed successfully.

SEBASTIAN LATHE.

As the increase in business warrants the expenditure the small repair shop adds a lathe to its equipment, a valuable addition as much work formerly sent elsewhere is turned out quicker and economy effected. Many times a job is held up waiting for a small piece of machine work sent outside.

The Sebastian Lathe Company, Cincinnati, O., makes a specialty of lathes and tools and produces a number of the former, one that is specially adapted for the garage being shown at Fig. 4. It is low priced, constructed of high grade material throughout, has screw, rod and power cross feeds, and cuts standard threads with furnished gears from five to 36. The head stocks are sturdily constructed and the spindles are hollow, made of a high grade steel and operate in phosphor bronze boxes.

The cone pulleys have four steps and with the back gear give eight changes of speed. The tail stocks are of the cut-under pattern, allowing the compound rest to swing parallel with the ways and over the base of the tail stock, with room to operate the feed screw handles. They have adjustable side movement for taper turning, heavy spindles and self-discharging centres. The carriages are of the most approved design, rigid and substantial, and T slots are arranged in both front and rear arms.

When it is desired to utilize the cross feeds separately, the carriages may be clamped solidly to the bed by a simple device. The cross feed screws are graduated to .001 inch. Plain or compound rests are supplied and these are interchangeable. The tool posts are cut from a solid bar, and the lead screws are cut carefully from a master screw, insuring accuracy. The countershafts have improved friction clutch pulleys with large surfaces, and ample provision is made for lubrication. The pulleys of the countershaft are nine inches in diameter with three-inch face and are designed to run at 190 revolutions a minute.

The dimensions of the lathe are as follows: Swings over bed, 13 inches; swings over carriage, 7.5 inches; length of bed, six feet; takes between centres, 40

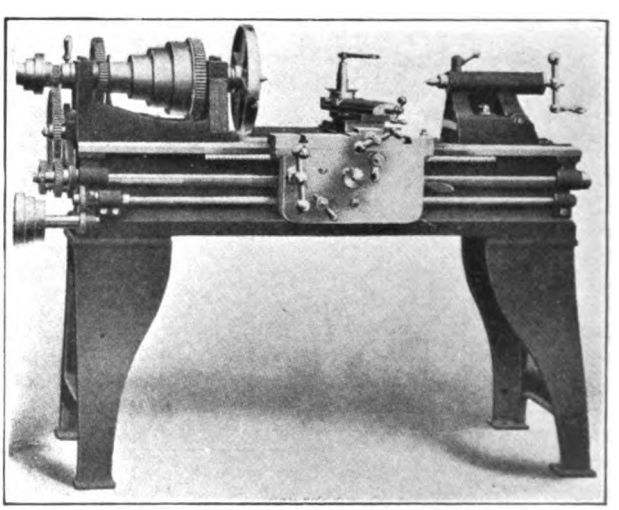

Fig. 4—Sebastian 15-Inch Lathe, Designed Especially for Automobile Work.

inches; diameter of spindle nose, 2.125 inches; threads of spindle nose, eight inches; hole through spindle. 1.3135 inches; size of tools, .5 and one inch; ratio

Digitized by Google

of back gear, 7.5 to one; diameter of tail spindle, 1.5625 inches; compound rest travels, 4.25 inches; capacity of centre rest, 3.5 inches. Hand rest and chuck plate are extra. A set of 10 tools is provided with the lathe.

CHAIN ADJUSTING DEVICE.

An operator of a commercial vehicle equipped with chain drive, had a chain break while on the road some distance from the nearest repair shop. Lacking the proper equipment to effect a repair, considerable time was lost before the broken link was removed and the separated ends brought together. The latter proved the most difficult as the tool kit did not include a chain tightener.

Being mechanically inclined the driver produced the device shown at Fig. 5 A. The stock consisted of a piece of .5-inch round steel, the ends of which were heated and forged to the shape depicted in the drawing. The metal was then cut in two and a right hand thread cut on one piece and a left hand on the other, for a distance of about .75 inch. A .5-inch coupling was next procured and filed hexagonal to permit the use of a wrench. The method of using the chain tightener is outlined in the drawing.

HOW TO SOFTEN FILES.

Occasionally a file will be purchased which upon trial is found to be tempered too hard and which tears the work. This trouble may be overcome by softening the tool. Cover the member with a thin coating of light oil and hold it over the fire until the lubricant blazes. As soon as the flame runs all over the file, it should be plunged into water.

HAVOLINE TOUR BOOK ISSUED.

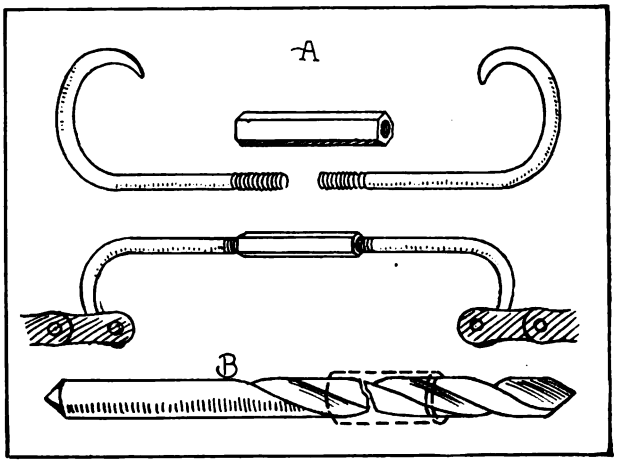
The Havoline Oil Company, 17 Battery place, New York City, recently issued the first of a series of 15 "Havoline Tours." The book comprehensively covers routes in New York, New Jersey and Connecticut, with a few side trips into Canada. Twenty-five routes are listed, pointing out not only the well established roads, but also many others that have been opened recently as a result of the campaign for road improvement in this section. Twenty-five maps are also shown. Copies of the route book may be obtained by addressing the Havoline company.

BAKER PLANT FOR CANADA.

The Baker Motor Vehicle Company of Cleveland, O., has formed a new company, it is announced, called the Baker Motor Vehicle Company, Ltd., of Canada, and it is said will build an additional plant in Toronto, Can. The Cleveland company manufactures both pleasure and commercial cars, while the new Canadian company is to confine its product to pleasure cars. Officers of the Cleveland company are: President, R. C. White; vice president and general manager, F. R. White; secretary and treasurer, R. C. Norton; directors, Bascom Little, D. Z. Norton, C. C. Bolton, C. W. Bingham and George H. Kelley. Officers of the Canadian company will include some of these men and members of the well known Walker family of Walkersville, Ont., will be interested. O. B. Henderson, sales manager of the Cleveland company, will hold the same position with the Dominion concern.

MOTZ TIRES ARE CHOSEN.

That the cushion tire is the proper thing for the electric motor vehicle would appear evident from a recent announcement by the Motz Tire & Rubber Company, Akron, O., maker of the Motz cushion tires, in which it states that of the 25 makers of electric vehicles, 22 are equipping their output with its product. It is claimed that Motz tires are as easy riding as properly inflated pneumatics, due entirely to the construction. The double treads are notched, giving a non-skid feature, also distributing the weight to the undercut sides. The latter are supported by slantwise elastic bridges which give and yield like the air in pneumatic tires.



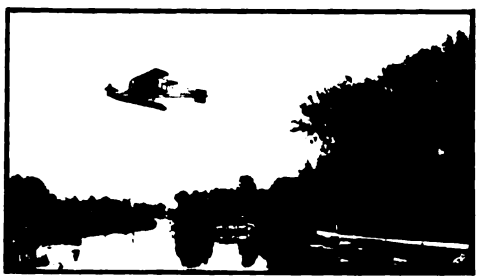


Fig. 5—Suggestions for the Repairman: A, Easily Constructed Chain Tightener; B, Method of Fitting Bush to Broken Twist Drill.

TUTTLE RESIGNS AS MANAGER.

Harry Tuttle recently tendered his resignation as service manager of the Dayton Motor Car Company, Dayton, O., the same to take effect Aug. 1. He is one of the best known men in the automobile business in the Middle West, and has a large circle of friends who will wish him success in his new field—the organization of an automobile parts company. Announcement regarding the new concern will probably be made within a short time.

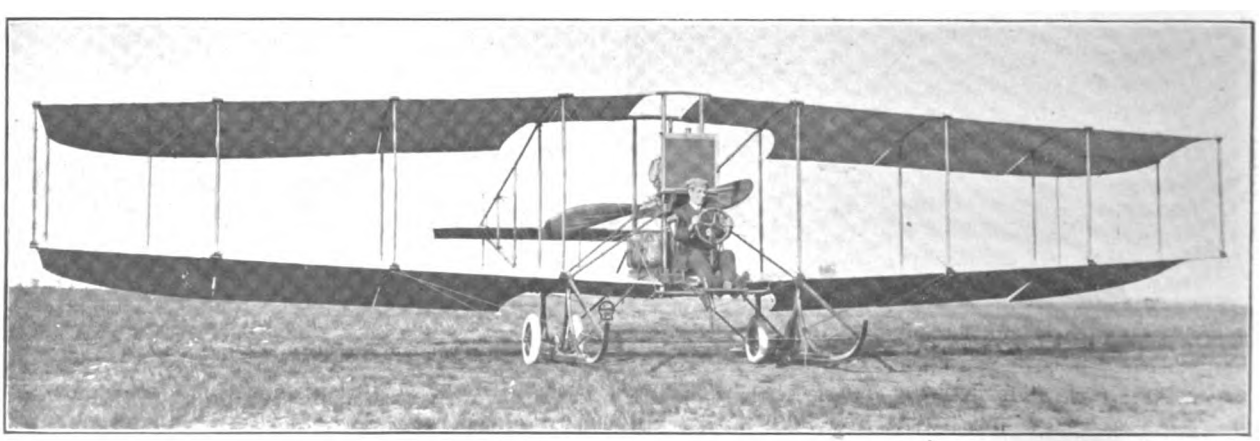
In The Aviation Field

With the Manufacturer and Operator in America and Abroad

Mlle. Helene Dutrieu, perhaps the best known of the French women flyers, has taken up the hydraeroplane. She has been trying out a new design by Henri Farman at Lake Engheim. Heretofore, Farman has been transforming his biplanes into hydraeroplanes by the attachment of pontoons, but his latest attempt is said to have been constructed throughout as an hydraeroplane, the first of this kind to be produced abroad.



Germany appears to be making decided progress in the matter of passenger carrying flights. Not so many months since the Germans were supposed to be giving all of their time and attention to the development of the dirigible balloon, but since one of their army officials visited the annual manoeuvres in France, the people of that country have taken more interest in the aeroplane. Several times of late, new passenger records have been made by German flyers.

Early in the month, Johann Schirmeister took four passengers for a duration flight of 33:42, at Leipsic. This exceeds the record of 32:33 made by Hoffman at Johannisthal, March 8. The same day, K. Grulich took two passengers aloft for 2:41:00, exceeding his own previous mark of 2:02:00. Although no mention of the machines is made in the dispatches from abroad, it is presumed that these flights were made with Harlan monoplanes, particularly as Grulich has been employing a machine of that make.

The flying fields on Long Island have been utilized by a number of designers in testing new aeroplane productions, and one which has been given decided attention of late is the Christmas biplane, manufactured by the Christmas Aeroplane Company, Washington, D. C. An accompanying illustration shows this machine ready for flight, proving beyond doubt that it is a practical invention.

The wings are set at a double dihedral angle, with an opening about two feet wide in the centre of the top plane, this being for the relief of air currents. The trailing edges of the planes are extremely flexible, and this is claimed to produce an automatically balanced machine.

Two seats are provided, these being placed immediately in front of the engine and in the centre between the two main planes. The controlling gear consists of a semi-circular wheel, which works the ailerons by a rotating movement, the vertical rudder by a twisting movement, and the wing warping by a fore and aft movement. The motor is a seven-cylin-

One of the Flyers at the Nassau Boulevard Field on Long Island, Trying Out the Christmas Biplane.

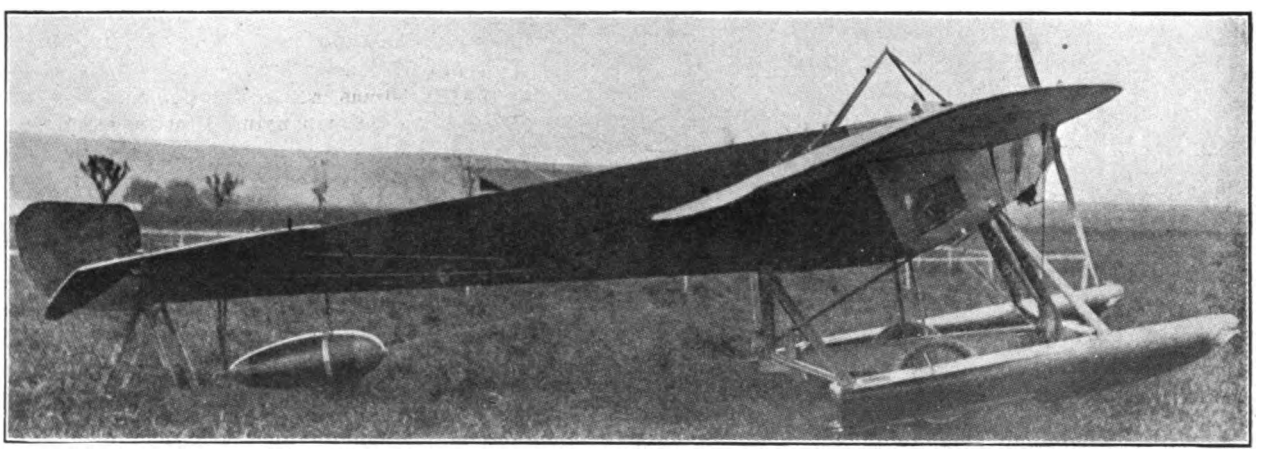
der, 50 horsepower Gyro, made by the Gyro Motor Company, also of Washington.

In all probability the fifth international race for the Gordon-Bennett cup in 1913 will held as a cross country event. Final decision will be made by the Federation Internationale Aeronautique at its meeting in Paris, next January. At the recent conference in Vienna, the matter was brought up by the British representatives. France alone favored continuing the enclosed aerodrome flights. America and Great Britain have long been in favor of the change.

In the death of Hubert Latham, France loses one of its pioneer aviators, a man who was well known in America and one who had many disappointments. He was killed by a wild buffalo during a hunt in the African Sudan, July 15.



Latham was born in Paris in 1883, of English parents and a relative of the German imperial chancellor, Dr. von Bethmann-Hollwegg. He was a skillful mechanic, and became interested in aerial navigation soon after the appearance of the Antoinette monoplane. While many other aviators considered this machine too large to be flown with success in high speed events, he was loyal to his first choice and continued to drive Antoinettes until his retirement.

He was among the first to attempt to cross the English channel, but always was prevented from attaining success in this respect. His initial attempt was made July 19, 1909, when he was thrown into the sea because of the failure of his motor. A similar fate resulted from his second venture. A number of times he narrowly escaped death while flying.

Burgess Co. & Curtis, Marblehead, Mass., engaged upon the construction of a biplane for the Aero Club of Illinois, which is expected to be flown in the fourth international race in September, has received word that the big 14 cylinder, 160 horsepower revolving Gnome engine has been completed and will be given its preliminary tests Aug. 1. It is expected that the new machine, equipped with this motor, will be capable of making a speed of 120 miles an hour.

Aeroplanes are to be used for the first time in militia manoeuvres in America during "the defense of New York City" in Connecticut next month. Both the attacking and defending armies will be accompanied by aviators, two on each side, who will be assigned to duty as aerial scouts, with instructions to keep the respective commanding officers informed as to the movements of the "enemy."

France has been decidedly interested in hydraeroplaning ever since Hugh Robinson and Louis Paulhan began demonstrating Curtiss machines of this type in that country. In the recent meet at Monaco, it will be remembered that a number of French machines were flown equipped with pontoons. One of the latest French products to appear thus equipped is the Nieuport. From an accompanying illustration it will be seen that the Nieuport hydraeroplane does not differ materially, in the main, from the Nieuport monoplane, with which Charles Terres Weymann won the Gordon-Bennett cup in the third international race of last year. In fact, it would appear that the only change was in the addition of the pontoons and the curiously shaped float at the rear.

Nieuport Monoplane, Fitted as an Hydraeroplane, by the Addition of Pontoons and a Novel Rear Float.

The Japanese army has bought three Curtiss hydraeroplanes of the Curtiss Aeroplane Company, Hammondsport, N. Y. Japan already owns four monoplanes and six biplanes, making its total aeroplane strength 13. It also owns one native and two Parseval dirigibles. Three Japanese aviators have been sent to Hammondsport to learn the operation of the new machines purchased.

While the Aero Club of America is withholding the names of those who have submitted specifications in the $15,000 contest for a machine to defend the Gordon-Bennett cup in the fourth international race at Chicago, it is announced that three were received.

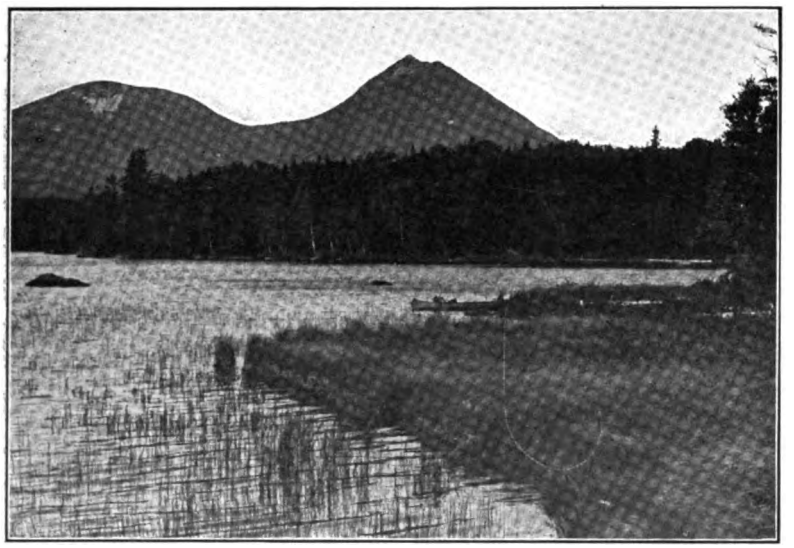
IN THE HEART OF THE MAINE WOODS

A FEW years ago Aroostook county, Maine, was an unknown wilderness. This applies in a measure to large portions of the district today, although the automobile has done much to overcome this, along the New Brunswick border. Not many sections of America, with the same population, area and conditions can muster more motor cars, and its roads are rapidly becoming such as to attract large numbers of tourists.

Beyond the fact that this is the very centre of the Maine woods, and that it is famed for the finest potatoes in the world, most motorists know little of Aroostook county. It follows from the above statement that not all of the district is covered with woods, although doubtless these virgin forests will have their appeal for the venturesome tourist. Fishing and hunting may be considered as ideal, and the entire section has been noted for years as a camping ground for vacationists.

TOUR NO. 33.

Tour No. 33 is designed to occupy five days, leaving from and returning to Bangor, from which point connection may be made with Vacation Tour No. 1 outlined in the Sixth Annual Touring Number. This feature will appeal to many tourists from sections outside of New England, since it will be possible to add this trip to any of the others presented in that number. The night stops are at Houlton and Fort Kent, Me.; Woodstock, N. B., and Calais, Me. Of course, it is possible to return to Bangor over the outward route, if preferred, reducing the necessary time at least one full day.



The way leads from Bangor along the Penobscot river to Veazie, the surface of the river being covered with booms and immense rafts of timber, floated down from the Moosehead lake region and toward Mt. Katahdin, glimpses of which may be had from the distance. Accompanying the lumber in the river are the numerous saw mills along its banks. This is particularly true of Oldtown, but first mention should be made of Orono, the seat of the State Agricultural College.

Oldtown is said to possess the largest lumber mill in the world, where over 100 saws are at work turning the rude logs, which come in at one side, into planks, these being rafted down the river to Bangor. On an island near the town is the home of the Tarratine Indians, one of the three tribes of the Etchemin nation. Although the most powerful and warlike of the northern tribes, the Tarratines rarely attacked the colonists. After a series of wrong and insults, however, they visited the settlements and inflicted such terrible damage that Maine became tributary to

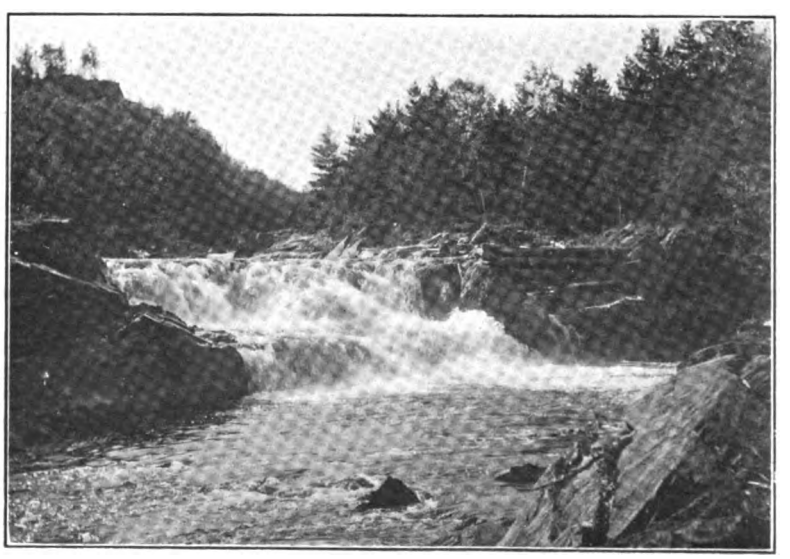
View of Spencer Mountain from Lobster Lake in Central Maine.

Digitized by Google

Mt. Katahdin, Maine's Highest Peak, as Seen from Kidney Pond.

them by the Peace of Casco. The treaty of 1726 contains the substance of their present relations with the state. They own the islands in the Penobscot, and have a revenue of some $7000 from the commonwealth. A ferry boat will take the tourist to their island home, and the visit is well worth while.

Leaving Oldtown, the route passes through a succession of thinly populated towns, Costigan, Olamon, Passadumkeag, Lincoln and Winn, to Mattawamkeag, a small village at the confluence of the Penobscot and Mattawamkeag rivers. Most of the inhabitants of these towns are engaged in lumbering. The last named village offers quite the best view of Mt. Katahdin, of volcanic origin, and Maine's chief claim to mountain scenery. From its rugged top may be seen all the lakes, rivers and woods of northern Maine, spread out like a map below. It is in the centre of the best moose country of the state, and a peak about which very little was known until quite recently.



From this point the tour passes through the heart of the Maine woods, abounding in spruce, cedar, hemlock, yellow and white birch, and maple. Splendid mills are to be found nearly all of the way, and particularly at Haynesville. Several important ponds are within easy access of the road, and the many streams throughout this district plunge on their way to the Atlantic over a succession of beautiful falls.

The night stop is at Houlton, the principal city of the country and noted for its beauty, its splendid homes and its hospitable people. Besides being engaged in the lumber business, Houlton is one of the principal markets for the famous Aroostook county potatoes. The soil in and about the city is wonderfully fertile, and the product is justly considered the finest in the world.

Presque Isle is the centre of the rich farming lands, which cover 500,000 acres. There also is good fishing and plenty of interesting scenery in the vicinity. Many Swedes have settled north of Presque Isle, as may be gathered from the name—New Sweden. Another extensive lumbering establishment is located at Van Buren, and lumbering also is carried on at Grand Isle. Madawaska was settled by the French, who were expelled from Arcadia in 1755. Twelve miles distant is New Fairfield, a famous starch centre.

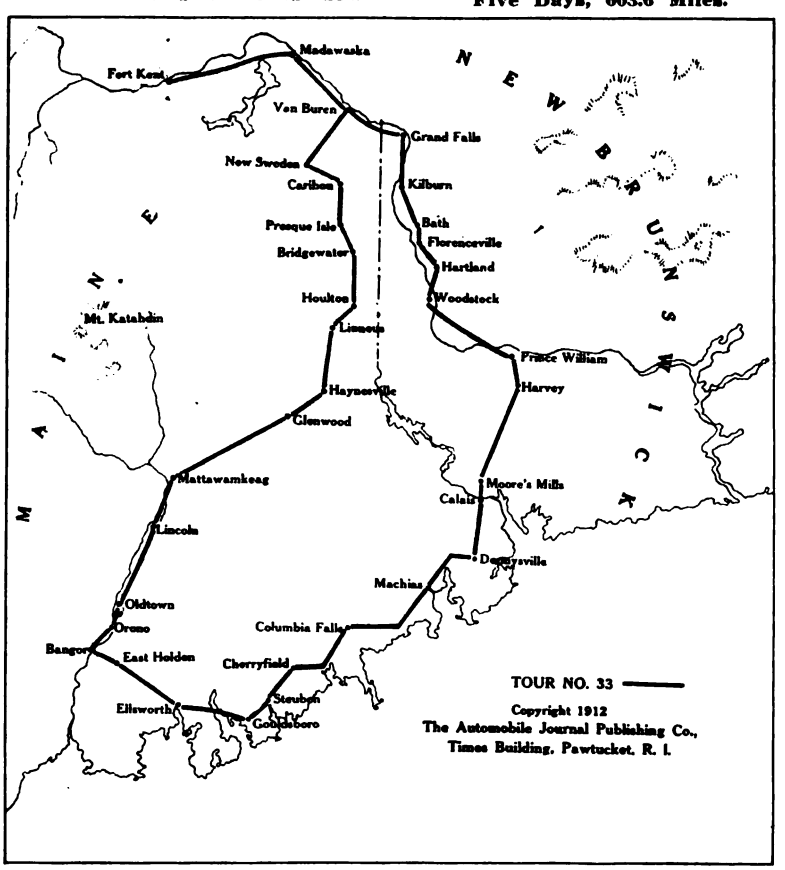
Fort Kent, the second night stop, is the most northern town in the United States. It is located at the confluence of Fish river and the St. John. Five miles away is Eagle lake, and dozens of other handsome bodies of water are in the immediate vicinity. All of these, as well as the many streams, are filled with big, gamy trout, and many salmon are caught in their season.

The return trip follows the outward itinerary to Van Buren, thence across the border into Grand Falls, N. B. Still other descendants of the Arcadians will be found in this vicinity. Here also the St. John river is contracted into a narrow gorge be-

Grand Falls, Webster Stream, One of Many Cataracts in Northern Maine.

Digitized by Google

tween lofty cliffs and plunges over a succession of rocky steps, the first in the series being a sheer drop of 40 feet.



Woodstock, the third night stop, is the shire town of Carleton county, New Brunswick, and is pleasantly situated on the banks of the St. John river, 150 miles from its mouth. From this point, it is possible to connect with the outward trip at Houlton, if desired. The return over this route is down the St. John to within 15 miles of Fredericton, thence across country studded with handsome lakes and fertile farms, to Harvey. The night stop is at Calais, Me., after visiting St. Stephen, N. B.

The last day's route is practically a reversal of the itinerary given for the first day in Tour No. 32, from Bangor to St. John, N. B., and listed in the Sixth Annual Touring Number, in which an alternate route from Calais is presented. It may be added that the information contained herein may be supplemented by the use of the route book published by the Maine State Automobile Association, which may be secured by addressing the secretary at 12 Monument square, Portland, Me.

TOUR NO. 33.

CORRESPONDENCE WITH THE READER

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Tires Wear Quickly.

(1406)—Of late I have been having trouble with a tire on one front wheel wearing out quickly. The rubber is nearly gone. The shoe on the other wheel was put on at the same time and is in good shape. What is the cause of the wear? SUBSCRIBER.

Newgate, Conn., July 6.

The wheel is out of alignment; that is, it does not travel in a straight line, causing the shoe to "scuff" or drag. This will wear out the tread very rapidly unless the trouble is corrected. It is possible that the steering knuckle or tierod has become bent through striking an obstruction in the road or running too close to a curbstone. The wheels should be aligned at once as the shoes will be ruined in a short time.

Providence to Clayton, N. Y.

(1407)—Being a regular subscriber to The Automobile Journal I would appreciate a routing from Providence to Clayton, N. Y. Also, please give me the mileage between Providence and Rochester, N. Y. SUBSCRIBER.

Providence, R. I., July 11.

While there is a shorter route from Providence to Pittsfield, Mass., the following itinerary is recommended because of the better roads. Having reference to the Sixth Annual Touring Number: Take Tour No. 13 from Providence to Worcester, Mass.; Tour No. 22 to Springfield, Mass.; Tour No. 23 to Pittsfield, Mass., the first night stop, the day's mileage being 151.9. Leaving Pittsfield the second day, follow Tour No. 52 to Albany, N. Y. and Transcontinental Tour A to Utica, the second night stop, with a mileage of 131.7 miles. The third day's route is as follows:

Utica to	Miles to	Total Miles
Deerfield	1.4	1.4
Rome	14.9	16.3
Delta	5.9	22.2
Stokes	1.7	23.9
West Branch	4.7	28.6
Ava	3.5	32.1
West Leyden	2.8	34.9
Mohawk Hill	4.7	39.6
Constableville	4.0	43.6
Turin	4.8	48.4
Houseville	4.0	52.4
Martinsburg	4.2	56.6
Lowville	3.6	60.2
Denmark	9.1	69.3
Carthage	6.1	75.4
Heaving	4.2	79.6
Fells Mills	4.7	84.3
Black River	3.2	87.5
Watertown	6.6	94.1
Brownville	4.2	98.3
Depauville	11.2	109.5
Clayton Center	4.1	113.6
Clayton	3.7	117.3

For the trip from Providence to Rochester, follow the above itinerary to Utica, and continue Transcontinental Tour A to Rochester, a distance of 138.8 miles, or a total distance from Providence of 422.4 miles. By utilizing Tour No. 23 from Providence to Pittsfield, this mileage may be reduced by 14.3 miles, but the better roads over the route suggested will more than make up for this additional distance.

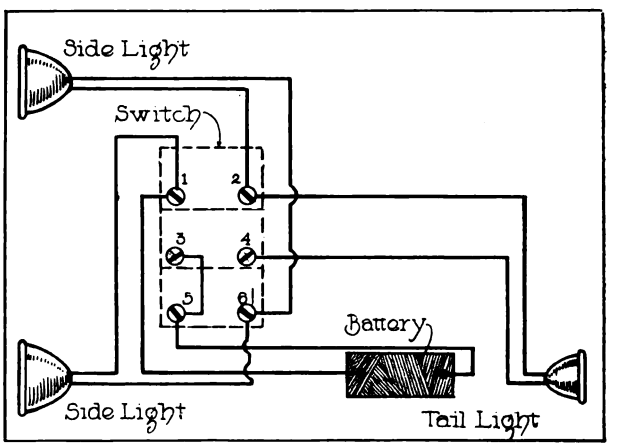

Fig. 1—Wiring Plan for Lighting Side and Tail Lights by Dry Cells, Also Outlining Three-Gang Switch Providing for Service of One or All Lamps.

Lighting with Dry Cells.

(1408)—I am considering the installation of electric lighting on my model T Ford car and understand that the magneto can be employed to supply electricity to the headlights when the machine is running. I wish, however, to do away with the use of kerosene lights, using electrics in these members by fitting connections for the lamps. I understand that the maker of the Columbia dry cells manufactures a battery for this purpose and that it is considerably cheaper than a lighting battery of the acid type. Will you please furnish me full information regarding this battery, also how best to wire the side and tail lights? I want to cut out the side lamps when the magneto is working, but have the electric tail lamp. Also is there not some method of wiring whereby the amount of electricity may be cut down allowing the lamps to burn dimly when the car is standing still? FORD.

Providence, R. I., July 15.

The magneto of the Ford car may be utilized to

Digitized by Google

supply current for the headlights as suggested and many owners are obtaining satisfactory results from such equipment. The gas lamps may be converted into electric units by fitting a parabola reflector and there are several designs upon the market. By utilizing these devices, the acetylene lights may be used if desired by removing the electric members and the arrangement practically makes for a dual lighting system. The straight electric lamps are not very expensive and some automobilists prefer these members.

The magneto cannot be employed to furnish current for the side and tail light when the machine is not operating and many Ford operators utilize the kerosene lamps. Electric adapters or converters may be fitted to the oil lamps and current supplied by dry cells or a storage battery. The amount of lighting service would depend upon the size of the bulbs used and amperage of the cells or battery. The storage battery, designed especially for lighting, is favored by many as these members may be obtained in 120 ampere-hour capacity, which would supply current for many hours before requiring recharging.

Dry cells may be employed, however, and the maker of the Columbia cells manufactures a multiple battery which is said to be very efficient and is not expensive. At Fig. 1 is presented a wiring diagram recommended by the company, which provides for two side and tail lights. The installation requires a three-gang switch operated by a push button arrangement, which provides six combinations of lighting. By pushing in one button all the lamps burn in series dimly which consumes about one-fifth of the current utilized when the members are operating at their maximum efficiency. Another button lights the left side light and another both members. It is also possible to burn only the tail light or all members in a group.

The maker of the Columbia multiple battery states that the member will give a minimum of 50 hours continuous burning when six-volt, two candlepower Tungsten lamps are utilized and that as the cells will not be called upon to supply such service the battery will recuperate through rest. With the lamps burning dimly, it is stated that a minimum of 300 hours service will be obtained for all three lamps and that this is equal to 60 nights of five hours each.

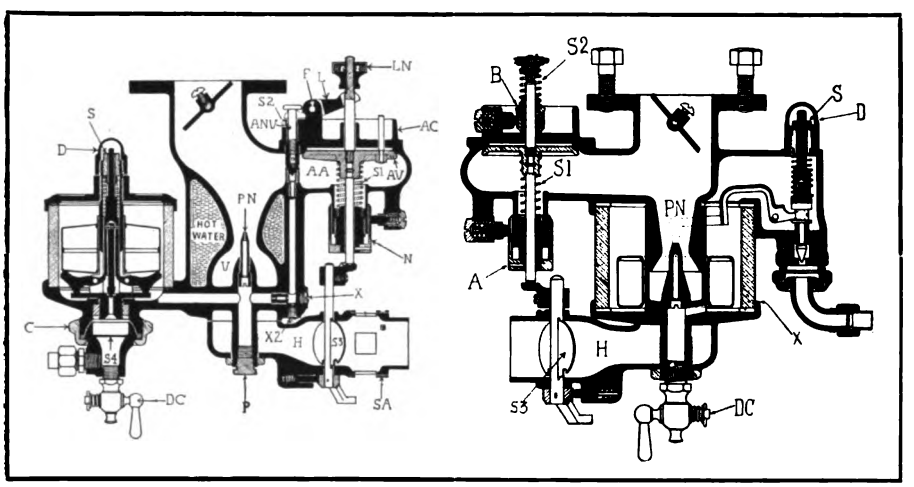

Fig. 2—Depicting the Components of Stromberg Carburetor and Adjusting Mechanism—Model B Is Shown at the Right and C at Left.

Adjusting Stromberg Carburetor.

(1409)—My motor car is fitted with a Stromberg carburetor which became filled with dirt through not straining the gasoline. I took the carburetor down to clean it and since replacing it on the machine, it does not act right. Not having adjusted one of these members and having lost my instruction book am writing for information as to its adjustment. CONSTANT READER.

Stonington, Conn., July 13.

In disassembling the carburetor it is probable that the adjustment of the speeds was changed. As the model was not stated, the method of setting both B and C are given herein. At Fig. 2 is presented the components of both types that of B being the right and C at the left in the drawing.

To adjust model B, turn on the gasoline and note the level of the fluid in the float chamber. It should be about .9375 inch lower than the lower edge of the glass marked X. This level is adjusted properly at the factory and should not require any attention. If wrong remove the dust cap D and turn the adjusting screw S until the proper level is obtained. If the fluid be too high, screw the nut down. If too low screw the nut up.

Next start the motor by closing the valve S 3 in the hot air horn H. The engine should start on the second or third crank. To adjust the low speed turn nut A until the spring S 1, which is the low speed spring, seats the valve lightly. Note that the high speed spring S 2 above B is free and does not come into contact with the nut on top of the auxiliary air valve stem. Next turn the nut A up or down until the motor idles properly.

To set the high speed, advance the spark and open the throttle. If the motor backfires through the carburetor, turn the high speed adjusting nut B up until the backfiring stops. If, however, with this adjustment and running at low speeds the motor operates erratically, the mixture is too rich. The nut B should then be turned down until this trouble is overcome. The spring nut B should always have at least .03125-inch clearance between it and the nut at the top when the motor is at rest.

The type C is provided with two separate gasoline spraying nozzels. The primary member P N is located in the centre of the carburetor and supplies

Digitized by Google

sufficient fuel for all speeds up to 20 or 25 miles an hour. The second or auxiliary nozzle A N, is mounted just beneath the secondary gasoline needle valve A N V in the auxiliary air passage A A. The auxiliary needle is raised by a lever L operating over a fulcrum F by the opening of the auxiliary air valve A V.

To obtain the low speed adjustment, turn the nut N located beneath the auxiliary air valve so that the valve is brought up to seat, then give two full turns to the right for pressure. This valve should not operate when the motor is running idly. Next, turn low speed nut N up or down until the motor operates slowly, then advance the spark and open the throttle. If a backfire follow, turn nut L N down until it ceases. If the mixture be too rich, turn it up. Be sure that nut L N and lever L have some clearance on low speed.

The high speed is regulated by the lock nut L N on top of the auxiliary air valve. Raising or lowering it determines the point at which the auxiliary needle valve A N will be brought into service. It is seated by the high speed spring S 2. The lock nut L N should be about .09375 inch above the lever L for normal adjustment, but this distance can be increased or decreased to suit the motor. Richness of mixture may be determined easily by noting the odor of the exhaust. If rich it will be pungent.

Tire Vulcanizing Outfit.

(1410)—We desire a vulcanizer for tires as well as inner tubes for our own use and would appreciate very much having you give us from your experience which vulcanizer would be most practical for our purpose. We are not equipped with electricity and will be obliged to utilize gasoline or some other heating means.

WARNECKE & STIEREN LAND COMPANY.

Karnes City, Tex., July 18.

Vulcanizing outfits utilizing steam are employed largely by garages, etc., and the equipment varies in size from the portable device for the motor car to those adapted to the tire repair business. Chas. E. Miller, 97-103 Reade street, New York City; the National Motor Supply Company, 1911 Euclid avenue, Cleveland, O., and the Williams Foundry & Machine Company, Akron, O., are among those who manufacture a wide variety of these vulcanizers and will furnish information upon request.

Philadelphia to Syracuse.

(1411)—In the next issue of The Automobile Journal, will you please give me a good road route through Pennsylvania and then New York from Philadelphia to Syracuse. I am driving a Ford car and from past experience can average 15 to 18 miles an hour over good roads for five or six hours' running.

PHILA.—SYRACUSE.

Philadelphia, Penn., July 12.

The itinerary below is believed to be the shortest practical route between these two cities. The Automobile Journal's information is that the roads are for the most part good to fair. There are a few bad places between Scranton and Binghamton.

Philadelphia, Penn.—Delaware Water Gap, Penn.—Binghamton, N. Y.—Syracuse, N. Y.

Three Days, 279.5 Miles.

First Day, Philadelphia to Delaware Water Gap, Penn., 90.3 Miles.

TWICE ACROSS COUNTRY.

Frank S. Foskett, wife and daughter, of Boston, Mass., are on their way home from a transcontinental automobile trip which will take them twice across the country. Leaving Orange, Mass., in an Overland, made by the Willys-Overland Company, Toledo, O., and travelling by the way of the northern route, which includes the Great Lakes, Wyoming and Utah, they arrived in California in August, 1911. They are returning by a southern route. Mr. Foskett believes that one of the prettiest parts of the entire trip thus far was from Phoenix to Roosevelt, Ariz.

INVITING MOTORING TOURISTS.

Motoring tourists report that many cities in New England and the East apparently have neglected the streets connecting with the various through state roads, with the result that it is many times impossible to enter or leave the city without encountering stretches of highway badly in need of repair. This is a condition that by no means acts toward attracting visitors to these centres for the night stop, or otherwise.

There appears to be more general need for co-operation between city and state authorities along this line. It must be recognized that city officials are hampered somewhat by the fact that their appropriations are limited and they have a large mileage upon which to expend the money. However, it would seem to be a wise plan to see that those streets leading to the main thoroughfares were kept in the best possible condition.

The business of catering to the desires of automobile tourists has received decidedly more thought abroad than has been true in America, albeit the people of the West have taken up the matter with energy during the past year. France and other Continental countries have discovered that visitors of this character leave behind them large sums and that money expended in attracting them is a splendid investment.

It is also of interest to note that the roads board of Great Britain has evolved a scheme by which some $3,000,000 will be utilized in the construction of motor exits from the most popular centres. The proposition contemplates a roadway 80 feet wide and of the very best modern construction. Without doubt, the time is not far distant when some such plan must be adopted in America.

RUNNING ON CAR TRACKS.

Apparently it makes little difference how often the various automobile publications call attention to the danger to tires, caused by running on the trolley tracks. It might almost be counted as unfortunate that these rails are spaced just far enough apart to invite such use. Without doubt the practise is occasioned by the desire to escape the discomfort of the poor pavements, etc., but if the drivers would stop to realize the increased tire cost, they would appreciate that such comfort was gained at a decided expense.

A concrete example of this added tire cost was brought to the attention of taxicab owners in New York City recently. With tires inflated to about 65 pounds pressure, the average for taxicabs in that city, it was found that continuous running on the car tracks caused the casings and tubes to adjust their shape to the edges of the rails, and with the full weight of the car pressing down on the tires, the rail edges acted like knives, tending to break the portions of the casing fabric bearing against them. Careful estimates indicated that at least one-fifth of the tire cost on these cabs could be traced directly to the fact that they were being run on the rails of the street car systems.

COST OF GASOLINE.

During the first half of 1912, the average price of gasoline in tank wagon lots increased from 10 cents a gallon to 15, indicating an advance of one cent, practically every 30 days. Of course, the reason is to be found in the ever increasing demand for automobile fuel in the face of a limited supply.

In the meantime, inventors are still experimenting upon devices which shall eliminate the necessity of depending upon gasoline for fuel. Several notable

Digitized by Google

successes are said to have resulted, although the time is not yet right for the announcement of their general acceptance.

FOR UNIFORM LEGISLATION.

Inasmuch as the season of 1912 bids fair to be one in which motorists will be given more than ever to long distance touring, including many transcontinental trips, the need for more uniform legislation on this subject is bound to be felt to a much greater extent. The unfortunate part of the situation lies in the fact that so much time elapses between the height of the touring season and the opening of the legislative sessions, that people forget these needs at the very time when they should be most remembered.

A study of the motoring laws in the several states indicates that considerable progress has been made along this line. However, so many commonwealths permit cities and towns to enact local ordinances that the benefits of uniform statutes are somewhat nullified. It is reasonable to expect that each locality must be given the right to regulate traffic as the needs of the community require, but this does not indicate that there is any reason in the enactment of regulations affecting the equipment of the car, for instance.

A great majority of motorists have every desire to comply with the law in all respects. They recognize that certain regulations are as necessary for their own safety as that of other users of the highway. Motoring tourists have even more reason for observing all due precautions, particularly if they are far from home. Unless there is a desire on the part of municipal authorities to discourage visits from these tourists, or to entrap them in a well organized scheme to enrich the public treasury, there should be no difficulty in the elimination of restrictions which are at best of doubtful utility in regulating traffic.

MOTOR EQUIPMENT IN HOT WEATHER.

Commercial vehicle salesmen are assisted in finding arguments during the heated periods which seem to arrive on periodical schedule during the past few years. The heat of the early part of this month was not so oppressive as that of the same season in 1911, but its effect upon horses was quite as marked in many instances. Motor trucks experience no difficulty in meeting any extreme of temperature.

One particularly good argument for all sorts of mechanical equipment of this nature came to light in Springfield, Mass., the afternoon of July 5. Fourteen fires, a majority of them apparently of incendiary origin, called out the down-town department between 12:30 and 3:45. All were in a restricted area, and at times the fires occurred so closely together that the bells hardly had time to cease ringing before another alarm was sounded.

Springfield is well equipped with motor fire apparatus, being one of the pioneer cities of the country in this respect. Only one piece of horse drawn equipment was called upon to answer these alarms, and upon its second return to the fire house the horses were unable to make another run, because of the heat. Had it not been for the fact that the city could depend upon its motors, the resulting loss must have been a matter of serious moment.

MINOR CIRCUIT BECOMES MAJOR.

The outcome of the 1913 show situation was a decided surpise, even to those who had been following the discussion most closely. In the first place, it appeared that the manufacturers were not inclined to be enthusiastic over the proposition of holding so-called national exhibitions even in the two larger cities of New York and Chicago. But that the sanctioning body should decide to add 10 other cities and continue the show season from the first of January to the last of March was unexpected, to say the least.

It will be remembered that several of the cities heretofore included in the so-called minor show circuit sought sanctions from the National Association of Automobile Manufacturers early in the present season, only to be met with refusal. There may never be any means of determining just what caused the change of attitude upon the subject, but the success which has attended the holding of shows in the smaller centres of the country during the past two years undoubtedly had its effect.

One peculiar feature of the new plan is the granting of a sanction to Boston, which always has held the largest show of all, at which the most business has been transacted, and yet the manufacturers never have cared to dignify New England's exhibition by the title of "National." Although the recognition is somewhat belated, it is probable that the dealers in Boston who have borne the brunt of the industry's most representative display for years, will welcome the assistance of those whose interests they have served.

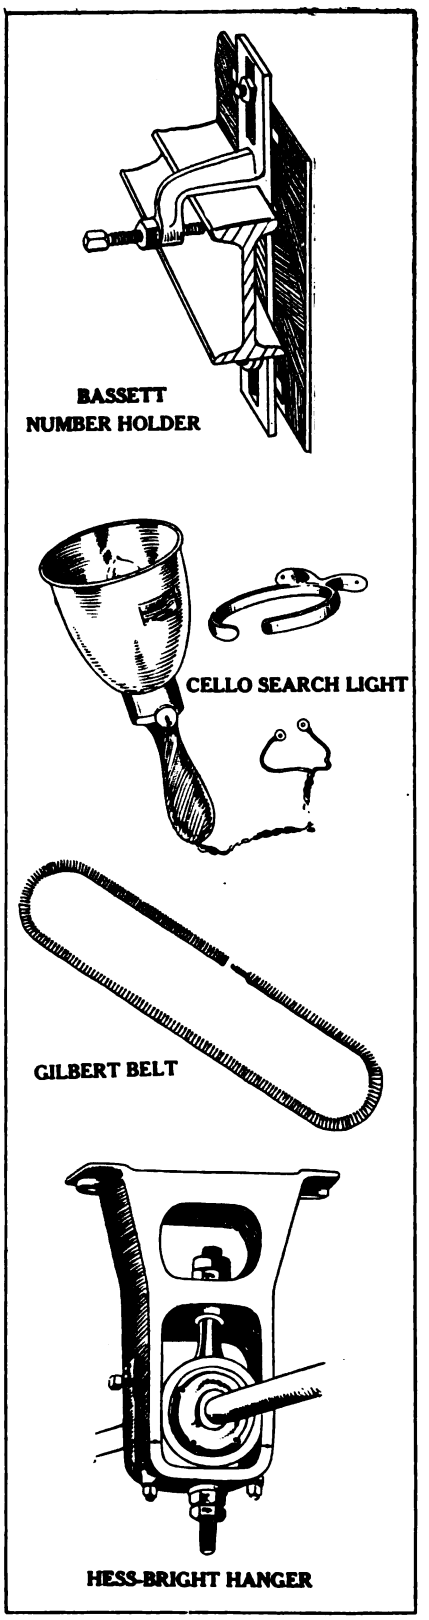
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

Bassett Number Plate Holder is one of many practical and useful accessories brought out by Charles A. Bassett, Providence, R. I., and is made in two styles for attachment to the front axle and rear of the automobile. The front device comprises a clamp with screw and locking nut and is so designed that it may be slipped over the I beam section axle and adjusted and locked easily. The number plate is attached to the holder by wing nuts and means are provided for adjusting the position of the plate.

★



The Cello Searchlight, manufactured by the A. S. Campbell Company, Boston, is designed especially for service in locating street signs, guide boards, door numbers, etc., and differs from those of usual construction inasmuch as it is equipped with a hanging bracket for attachment to the car. The latter arrangement makes for convenience, as the lamp is always accessible. The diameter of the reflector is three inches and the bulb is a tungsten, eight candlepower requiring a six-volt current. The lamp is nickel plated and it is claimed by the maker that it will throw a powerful beam of light.

★

The Gilbert Steel Belt, produced by the Gilbert Manufacturing Company, New Haven, Conn., is a device which eliminates slipping of the member as it is composed of the finest grade of coiled piano wire and when utilized for driving fan or oiler pulleys maintains the proper tension at all times. A feature of the Gilbert product is that the ends of the belt form threads for screwing together when attaching the member. The belts are made in different sizes and lengths and are inexpensive.

★

The Hess-Bright Hanger, made by the Hess-Bright Manufacturing Company, Philadelphia, well known maker of bearings, possesses many advantages over the ordinary form of hangers as by the utilization of ball bearings instead of plain members, friction is reduced to a minimum, power cost reduced, and economy effected in operation, as well as in space in shafting. Careful experiments conducted by the company developed the fact that with ordinary babbitt bearings there is a considerable loss due to friction and that with Hess-Bright ball bearings the coefficient of friction is but one-sixth of one per cent. Another feature emphasized of the ball bearing hanger is that it rolls true in contact regardless of shaft deflection, does not heat and requires but little lubricant for proper operation.

★

Dixon's Motor Chain Compound, manufactured by the Joseph Dixon Crucible Company, Jersey City, N. J., is a composition of graphite and a lubricant especially adaptable to motor chains, and comes in solid form, neatly and compactly wrapped. It is well known that the best treatment for driving chains is to cleanse them thoroughly and immerse them in a bath of graphite and tallow or similar material. This involves melting the tallow and mixing in the graphite. The Dixon preparation not only saves this work but insures the proper proportion of the lubricants and the right grade of graphite. A quantity of the compound, sufficient to cover the chains, is cut from the block and melted at a temperature of 180 degrees Fahrenheit, after which the members are plunged in cold water to harden the lubricant.

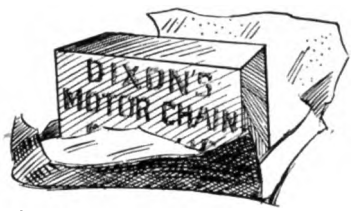
★

E. & J. Parabolic Reflectors are being marketed by the Edmund & Jones Manufacturing Company, Detroit, and will appeal to owners who wish to convert their gas lamps into electric members. The device is interchangeable, composed of high grade material, and the reflector is a true parabola heavily silver plated. It is equipped with the company's adjustable

Digitized by Google

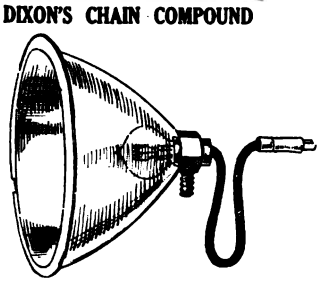
focusing attachment which provides for any variation of the bulbs, as well as different beams of light. All reflectors are fitted with the Ediswan socket, connector, ample length of cord, and when inserted in the acetylene lamp are water and dust proof. They are designed to utilize 12 candlepower lamps.

★



States Folding Hats have been brought out by the States Manufacturing Company, Chicago, and will interest a large class of motorists who employ their machines for travelling to and from the house and office, and who desire a hat that may be folded and placed in the pocket when not in use. The member is very light, made of silk and wool and in nine different shades. Its design is such that it may be adjusted easily to any position and is adaptable to both sexes.

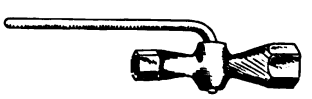
★



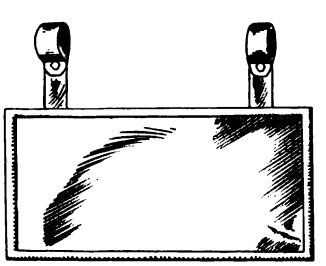
The Springfield Spark Plug Wrench is a valuable addition to the tool kit of the automobile as with it stubborn plugs may be removed easily and without danger of breaking the porcelain or injuring the shell. When an ordinary wrench is employed unless the operator be careful, the tool will slip, rounding the edges of the hexagon faces. The device brought out by the Shawyer Company, Springfield, Mass., provides for two different sized plugs, one end fitting those .875 inch across the face and the other 1.125 inch. An adjustable handle facilitates the operation of the tool which is eight inches long and weighs one pound. Being compact, it occupies but a very little room in the tool kit.

★

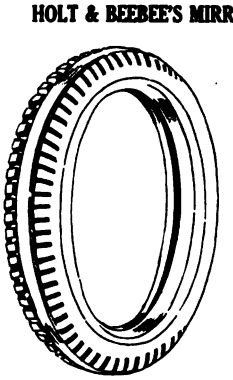
The Holt & Beebee Mirror is manufactured by Holt & Beebee, Boston, and is a practical and useful accessory for the automobile, especially where operated in heavy traffic. It comprises a mirror in a suitable frame and includes means for attaching to the windshield or the latter's frame. It allows the driver to note at a glance the movements of all vehicles behind, thereby preventing the possibility of accidents. It is also of service when on the road as the movement of a machine approaching from the rear may be discerned easily.



DIXON'S CHAIN COMPOUND



E. & J. PARABOLIC REFLECTOR



STATES FOLDING HAT

SPRINGFIELD SPARK PLUG WRENCH

HOLT & BEEBEE'S MIRROR

TYRIAN ANTI-SKID TIRE

★

The Tyrian Anti-Skid Tire is the product of the Tyer Rubber Company, Andover, Mass., and it is claimed by the maker that its design is such chains are not necessary, as the shoe will grip the road. The tread has a number of block like corrugations running transversely and between these is a strip extending in an opposite direction. It is pointed out by the maker that the two evenly moulded channels running around the tire allow the shoulder in the middle to grip the road, preventing skidding. The cross channels eliminate forward slip and make easy the starting of the machine.

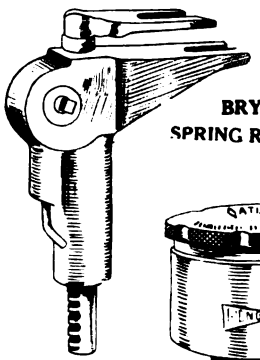
★

The Bryant Spring Remover, marketed by Stevens & Co., New York City, is a compactly designed little tool for removing or replacing valve springs and is made in three sizes to fit any diameter springs. It differs from the usual valve tool as the spring is compressed or released by a rack and gear arrangement. Means are provided for locking the device in any desired position. The steel engaging device on the end of the lifting rack is a feature, as it will pass easily between the coils of the valve spring and may be twisted slightly if desired. The rack is of cold rolled steel, accurately cut to mesh with the cut gear, and the catch pin is of steel and will hold equally well in either direction. The engaging device is of high grade material, fitted and pinned securely to the rack, and the tool is nicely finished, comes in a box, and is inexpensive.

★

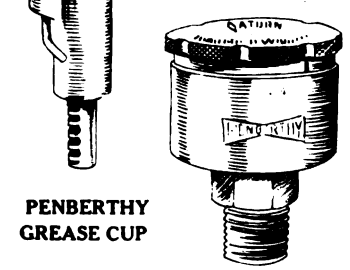
The American Compensating Valve, manufactured by the American Compensating Valve company, Manitowoc, Wis., is a

Digitized by Google



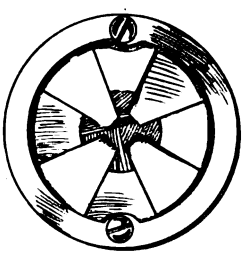
device which is attached to the auxiliary air intake of the carburetor and it is claimed by the maker that it mixes properly the air and fuel by dividing the area of the auxiliary air opening. It makes the motor exceedingly sensitive, quick to respond to the throttle and by the divided area maintains a normal vacuum under varying speeds, thereby producing a constant and uniform mixture. The device is attached easily and once set properly requires no further attention.

★



The J-M Dry Cells, made by the H. W. Johns-Manville Company, New York City, are in two types, round or square, and are manufactured especially for ignition work in motor cars, gasoline motors, signal horns, small lights, bells, etc. They register 1.5 volts a cell and are made in 20, 30 or 35 amperes capacity. It is pointed out that two series of J-M cells connected in compound series multiple, instead of series or multiple, will afford about three times the life of a single series on current, on account of the reduced rate of discharge. The J-M batteries are guaranteed to give entire satisfaction.

★



The Penberthy Grease Cup is being marketed by the Penberthy Injector Company, Detroit, and is provided with a dust proof ratchet device facilitating its operation. The cap is locked to the body of the shank by means of a cylindrical dust proof shell having projections on its inside which fit the grooves of the cover. The projections are so arranged that a very fine adjustment is possible. The positive lock arrangement prevents loss or displacement of the cover through vibration, etc., as well as permitting the desired position. The shell is also utilized as a drip cup which fits around the cover, completing the dust proof feature. The cup can be screwed in or out easily as the lugs pass over the grooves in the cover with very little pressure, yet lock positively. The same design

AMERICAN COMPENSATING VALVE

J-M BATTERY

MORGAN PRIMING CUP

is also fitted with a ball check in the shank and is especially adapted for service in places subjected to heat. Another similar style has the shank of the cup integral with the cap. The dust proof and ratchet features are incorporated in all designs. The Penberthy device is especially adapted for motor car service where grease cups are subjected to considerable vibration.

★

The Morgan Priming Cup, is the product of B. Morgan, Newport, R. I., and possesses many advantages over the usual construction as it is claimed by the maker that leaking, sticking or the possibility of broken handles are prevented. It comprises two parts, one of which is screwed into the cylinder head, while the other is screwed into the bushing member and when rotated provides a suitable opening for the priming fluid. Another feature of the device is that it gives a large opening into the cylinder, facilitating valve or ignition timing by the piston. The Morgan priming cup is made in standard sizes, either male or female, and is constructed of high grade material.

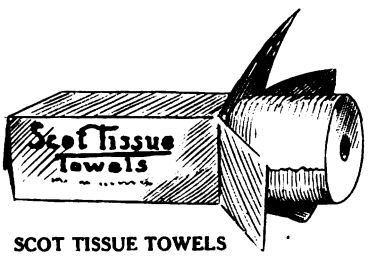
★

The Scot Tissue Towels will appeal to automobilists who experience motor car troubles upon the road as the members serve the same purpose as a cloth towel and in addition are handy for cleaning the lenses of the lamps, etc. The material comes in perforated rolls and absorbs moisture, being on the principle of a blotter. They are very sanitary and being soft do not irritate the skin. The roll contains 150 towels, is inexpensive and may be utilized in many useful ways. The towels are produced by the Scott Paper Company, Philadelphia.

★

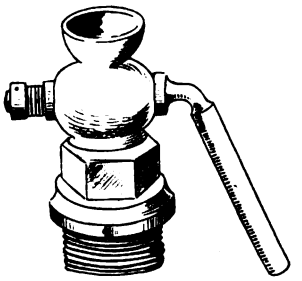
The Swenson Priming Cup, manufactured and marketed by B. A. Swenson, Providence, R. I., is a neat, compact device whereby gasoline or any other fluid may be injected into the combustion chamber of a motorcycle motor.

Digitized by Google



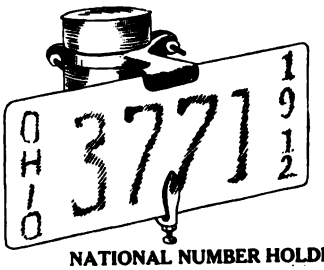
The primer is fitted with a bell shaped cup eliminating the spilling of the fuel and operated by a durable handle which when in normal position insures a gas tight device. They are made for Indian mounts, or any metric thread, constructed of high grade material and finely finished. The hexagonal faces permit of screwing the primer into the cylinder securely as well as make removal an easy matter.

★

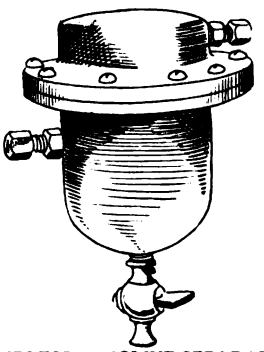


The National Number Holders, produced by the National Motor Supply Company, Cleveland, O., are made for attachment to the radiator cap, also to be fitted to the rear lamp bracket. The former are adjustable and will fit any car and carry any size of license plate. The device is attached easily to the filler cap being constructed in two parts and provided with retaining bolts and locking nuts. The holders are made of high grade material and are finished carefully in black japan.

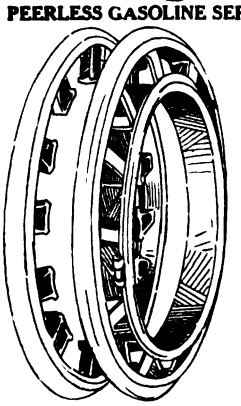
★



The Peerless Gasoline Separator is a practical accessory as when incorporated in the main fuel line it catches all moisture and foreign elements that may be present in the gasoline. The device is constructed of brass or aluminum, the former being designed for service on motor boats operating in salt water. The separator is in two sections, the fuel entering the lower and passing up through a chamois strainer into the upper chamber from whence it flows to the carburetor in the usual manner. All water or dirt being heavier than the fuel drops down to the bottom of the lower compartment whence it is removed easily by opening a petcock with which the filter is equipped. A special grade chamois is utilized and the maker points out that it will not harden or become dirty as it is maintained in a moistened condition by the flow of the gasoline. The device is made in two sizes by the Stott-Crowley Manufacturing Company, Detroit.



SCOT TISSUE TOWELS



SWENSON PRIMER

NATIONAL NUMBER HOLDER

PEERLESS GASOLINE SEPARATOR

DETROIT EMERGENCY TIRE

The Detroit Emergency Tire, as the name implies, is designed to replace a shoe in the event of trouble and is marketed by the Detroit Emergency Tire Company, Detroit. It comprises a steel channel rim carrying a solid shoe, also brackets which fit the regular rim when the pneumatic tire is removed. The device is equipped with a draw locking ring, which when tightened secures the rim to the wheel. The best of material is employed and the tire is attached easily and quickly by the utilization of a special wrench. The company points out that its design is such that easy riding qualities are provided and that it will fit any type of rim.

U-Vulk is a liquid preparation by the utilization of which tires and inner tubes may be vulcanized without employing heat. It is marketed by J. E. Gimperling & Son, Dayton, O., and it is stated by the maker that containing no acid it will not injure a tube or casing. It is also claimed that cuts and tears in casings may be repaired easily and quickly in a few minutes and that the operation is so simple that it may be performed by those not familiar with tire construction. It will appeal to those who maintain their own machines, and in addition to being of service for tires, may be employed to repair rubber wearing apparel and appliances such as the horn bulb. The U-Vulk outfit is very complete and inexpensive.

★

The Dayton Tire Bandage, manufactured by the Dayton Inner-Tire Company, Dayton, O., is an adhesive bandage, nine feet long, three inches wide, of two-ply, 16-ounce tire fabric and designed for emergency use in the event of a blow-out or bad cut to the casing. The ends of the bandage are equipped with large brass eyelets and means for fastening. It is stated that the bandage cannot slip and that dirt or water is eliminated by the adhesive qualities which are incorporated in it.

WORM AND HELICAL GEARS.*

(By Frank Burgess.)

EUROPEAN practise, extending for over 15 years, has given ample evidence of the eminent success of the helical type of gearing, and I feel confident in saying that in the near future a large per-

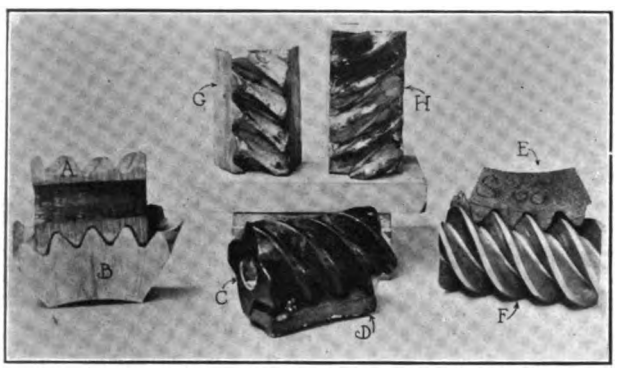

Fig. 1—A Group of Hindley Worm Gears.

centage of the cars in the United States will be equipped with this drive. Mileage records of 50,000 to 124,000 have been established.

Regarding the terms "worm," "helical" and "spiral" I would say that "spiral gear" is the term commonly given to a gear the teeth of which have a uniform twist parallel to the axis, although for technical correctness the word "helical" should be used instead of "spiral." A spiral is a line generated by progressive rotation of a point around a fixed axis, with a constantly increasing distance from the axis. Two forms of the spiral are the plane and the conical. Kent states: "When the axes of two helical gears are at right angle, and a wheel of one, two or three threads works with a larger wheel of many threads, it becomes a worm gear, or endless screw, the smaller wheel or driver being called the worm and the larger or driven wheel the worm wheel."

I suggest standardization of terms, and that to avoid confusion any gears of the helical type transmitting motion with shaft angle at 90 degrees, with a speed reduction less than 10 to one, be termed "right angle helicals;" and with any other than 90 degrees shaft angle the term "helicals," stating specifically the exact angle of shafts. If shafts are parallel the term "helical spurs" should be used.

As the term "right angle helical" is not as convenient as the term "worm gear," and inasmuch as for automobile work most ratios will be less than 10 to one, with 90 degree shaft angle, I would suggest the term "helical gears" as most appropriate. Otherwise it would be better to use the general term "worm" or "worm gear" to include all reduction ratios, even as low as one to one. This matter should be settled promptly one way or the other.

Worm gears were used at a very early date. Archimedes is credited with the invention of the screw in 250 B. C. for the purpose of launching a large vessel built under his direction. Hero of Alexandria in 150 B. C. showed the screw in several forms of his "spiritalia." About 1600 Jacobi Bessoni designed a rude lathe for cutting wooden screws. Important improvements in screws and screw cutting machinery were made by Jesse Ramsden, Henry Maudslay, Sir James Barton, Sir Joseph Whitworth and William Sellers.

During the past 20 years great strides have been made in the development of helical gears. The adoption of these gears for parallel and right-angular drives has made practically a new element in machine design. Until this form of gearing was made commercial by the invention of special machinery suitable for economical production, there was considerable reluctance on the part of the manufacturers to adopt the helical gear.

The principal reason for the adoption of the helical form of tooth appears to be its peculiar quality of silence, regardless of speed or load. With the best methods of design and assembly, great durability, strength and efficiency are obtained.

It is impracticable in an article of this character to cover all the details satisfactorily. However, I believe that on all styles of cars in the United States today the worm gear could be used successfully for rear axle purposes.

The successful worm gear should embody the following qualifications:

1—Cheapness of construction.

2—Strength for resisting shocks.

3—Hardened and smooth surfaces for durability.

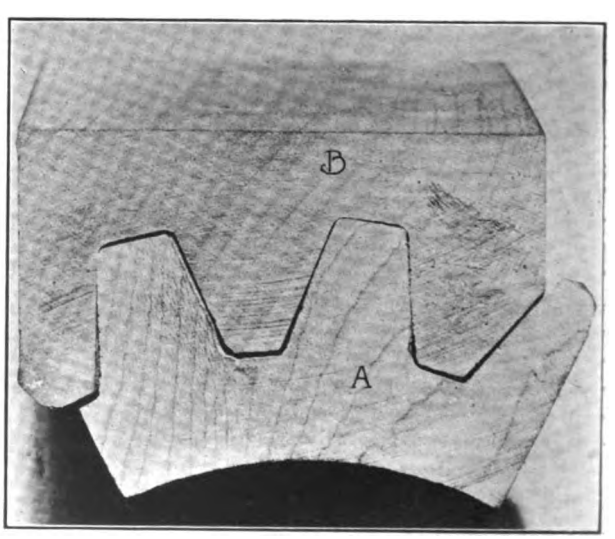

Fig. 2—Wooden Model Hindley, Enlarged 2.5 Times.

*Paper read at midsummer meeting of Society of Automobile Engineers in Detroit.

Digitized by Google

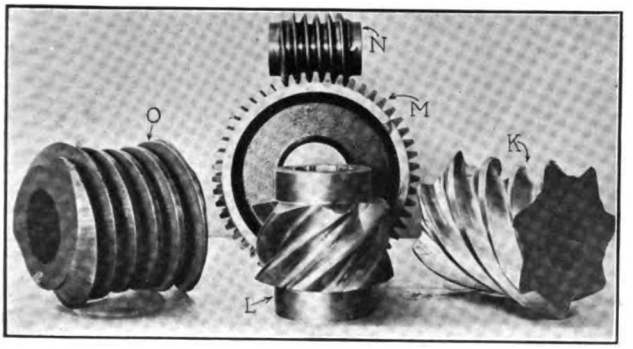

Fig. 3—Some Examples of Thread Cutting.

4—Material of a suitable composition to reduce friction.

5—Simplicity of construction and mounting.

6—Perfect bearing condition.

7—Noiselessness at any speed or load.

8—Reversibility.

9—Lightness in weight.

10—Efficiency in power transmission.

Granting that there is some argument against the worm in regard to trucks as to the dead axle proposition, this could be overcome by using the worm gear on each end of the axle, the same as sprocket wheels, having a double worm gear drive in place of the cumbersome chain drive. If at first slightly more expensive than the chain and sprocket drive, less repairs will more than make up the difference. Care should be taken to have accurate and first class bearings, both radial and end thrust.

Considerable discussion has arisen in regard to the relative merit of the straight and Hindley types, the latter first being used by Hindley of York, England. In my opinion both can be used successfully, although each has its own advantages and disadvantages. For most purposes, particularly where considerable power is to be transmitted, the Hindley has the advantage, but with ordinary machinery it is somewhat more difficult to obtain the same degree of accuracy that can be obtained in the case of the straight type.

From tests made there is no question but that there is a larger bearing surface on the Hindley type of worm than on the straight. Therefore this type of gearing will for the same pitch present a bearing of greater durability and manifestly heat less than the straight type, particularly under heavy load.

The straight type may have less trouble with end thrust bearings. The worm can move in its position longitudinally with the worm axis and therefore does not require as close adjustment of the end thrust bearings.

With first class bearings the Hindley type has the advantage, as a smaller and lighter gear can be used, thus reducing expense, especially if made up in large quantities.

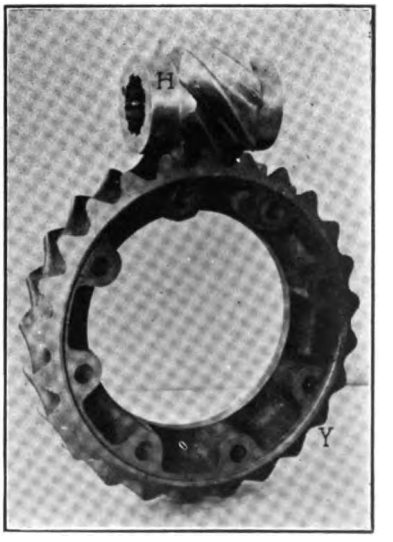
Referring to Fig. 1, which represents a group of Hindley gears, the pinion in the centre marked C and the sector gear marked D show a perfect form of the Hindley type. These were made by first generating the spiral pinion C, then the sector D was made of plaster of Paris. It will be noticed by looking at the teeth carefully that the three teeth fit closely one to the other, thereby forming perfect tooth bearing. Where the sides of the teeth of pinion C are slightly convex they are correspondingly concave on the mating teeth of gear D, thereby giving approximately theoretically correct bearings.

Gears E and F represent pinion F and section E at centre of sector gear, straight type. By closely observing the bearing of the teeth of these gears it will be seen that there is only what would be called a point bearing. It is quite plain to the eye that there are less bearing points with the straight type of worm than with the true Hindley. The latter set of gears, E and F, was cut on the generating machine.

Gears A and B are a set of wooden models of Hindley gears. A section of both pinion and gear is shown at the centre. This also shows that a set of Hindley gears has a greater bearing surface than the ordinary straight type E and F.

G and H are two plaster of Paris casts taken of the teeth of the worm and gear, H being an impression of the gear and G of the worm. From these casts we are enabled to determine the tooth bearing by cutting sections A and B from a pinion and gear. We find by rubbing together the surfaces of the worm and gear, one of which is coated with sulphate of copper, that there is a much larger contact bearing on the Hindley type than on the straight type.

Fig. 2 shows a wooden model enlarged about 2.5 times actual size, of worm and worm gear teeth of the Hindley type, ratio one to one. The teeth show straight faces, with no convexity, and it will be noticed that they have a large and flat bearing surface. This also is a case where the worm or driving member is larger than the driven gear B.



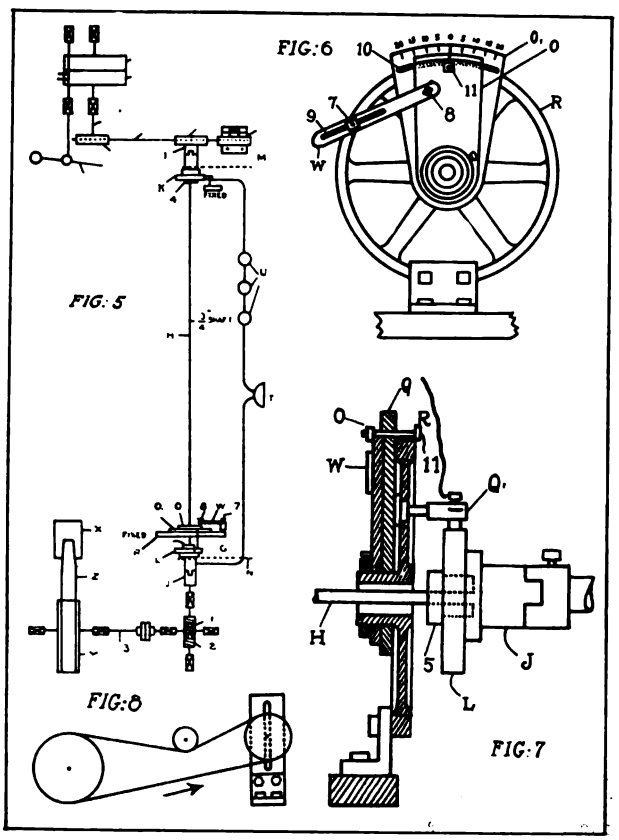


Fig. 4—Hindley Worm Gear and Conical Spiral Worm.

Referring to Fig. 3, seven-threaded Hindley pinion K is the same as Hindley pinion L, with the exception that the face is abnormal being continued out to show the conical spiral Hindley cut. There is no advantage in the additional length of face over that of L except for the purpose of comparison. It is found that it is not necessary to make the face of a conical spiral gear as wide as that of the

Digitized by Google

Figs. 5, 6, 7 and 8—Outlining Efficiency Testing Apparatus.

straight type. The length of face on the Hindley gear is 1.875 inches between extreme points, and at the base of the tooth 2.25 inches. There should be a slight chamfer on the edge of the teeth.

A single-thread Hindley gear M in the centre is of about 5.75-inch pitch diameter and .375-inch pitch. This gear has six teeth in contact with worm N, the pressure angle is 12 degrees and the included angle 24 degrees. Worm O is a double-threaded Hindley. These gears show considerable bearing surface and give high efficiency under ordinary loads.

In Fig. 4 H and Y represent a Hindley worm gear and conical spiral worm with a speed reduction of 3.57 to one, 25 by seven teeth, .875-inch pitch, designed for a gasoline pleasure car of 40 horsepower.

The hardening process for the worm should be such as to cause the least amount of distortion, careful methods of heat treatment being employed. The benefit of this is that the gear teeth of the Hindley type which it is impracticable to grind can thereby be lapped, making the teeth concentric with the hole, which is very essential in a worm of this type. The gear should have a mirror-like polish. In this way with hardened concentric polished tooth surfaces the Hindley type presents a better surface of contact than the best form of straight worm, even though the latter is finished by grinding.

The gear is flanged on one side with eight lugs, with hole in the centre of each lug for mounting same on differential casing. There is a slight shoulder on each side of this gear so that the differential casing will form a double web, stiffening the gear so that there is no opportunity for side vibration, thereby reducing the bronze metal to a minimum.

The worm gear should be made of a special mixture of hard bronze. The gear should be slightly polished after being cut to insure a perfectly smooth glazed surface to mesh with the hardened polished worm. This set of gears, properly housed, with ball bearings and the right lubricant used, will give an efficiency of at least 90 to 95 per cent.

A simple method of testing the gears for efficiency without elaborate apparatus is to run them in their regular housing, containing a bath of oil, subjected to load to be transmitted. If they do not have a high temperature after running several hours they indicate high efficiency and suitability for the given purpose.

That there may be a satisfactory method of knowing whether gears will be suitable before being placed in cars and tested on the road, insuring proper efficiency and absence of excessive heat finally destroying their usefulness, it is quite necessary that manufacturers of rear axle drives using this form of gearing should have a proper way of testing exactly the efficiency of the gears. It would be very expensive to replace the gears after installation. After a careful study of the best mechanical and electrical absorption and transmission dynamometers, an efficiency testing machine, similar in some respects to the apparatus used at the Massachusetts Institute of Technology by Prof. F. C. Riley, was constructed during 1911. The prony brake was adopted for an absorption dynamometer and a long shaft of a small diameter arranged

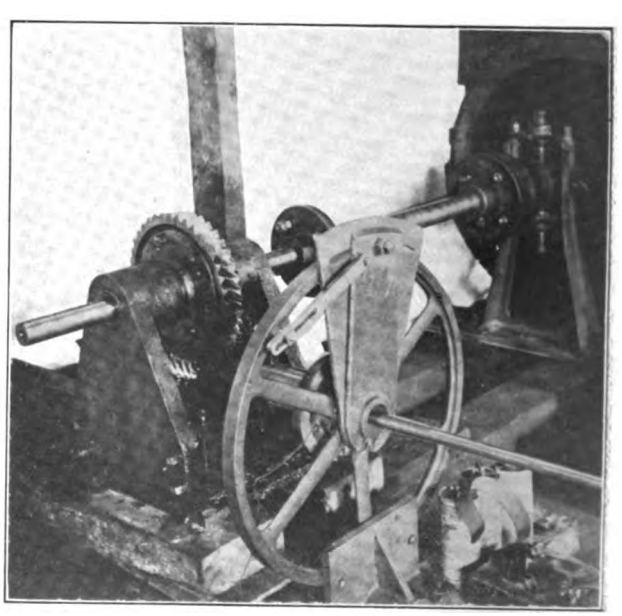

Fig. 9—Efficiency Testing Apparatus Assembled.

Digitized by Google

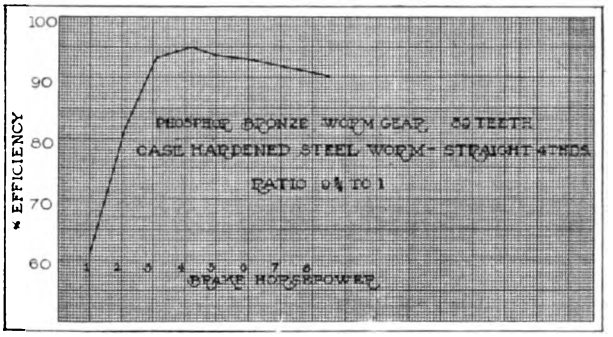

Fig. 10—Efficiency Diagram Plotted from Results Obtained by Test of Straight Worm and Worm Gear.

to obtain the torsion of the shaft in degrees by an electrical indicator apparatus for a transmission dynamometer.

This efficiency testing apparatus is shown in Figs. 5, 6, 7, 8 and 9. On shaft H is worm 1 driving the worm wheel 2 on shaft 3, on which are prony brake wheel Y and brake arm Z bearing on platform scales X. On each end of the shaft H are clutches I and J, in which are fitted bushings 4 and 5, in which the shaft H is sweated. Attached to clutches I and J are fibre discs K and L in which are inserted brass contact points making electrical connection through the fibre discs to shaft H. Bearing on the peripheries of these fibre discs are spring brushes Q and Q^1 to which are fastened insulated copper wires, in the circuit of which are located dry batteries U and the telephone receiver T. Spring brush Q is fixed while spring brush Q^1 is attached to sector O^1 concentric with the shaft H movable on lug of fixed iron wheel. Sector O is graduated each side of zero to 20 degrees in .5 degrees. Sector O^1 is fastened to fixed wheel R by link W and bolts 7 and 8 and is adjustable a small amount by slot 9 through which bolt 7 is clamped to wheel R. This sector O has a zero marked at the top which moves over the graduated sector O^1 thus enabling a fine adjustment of the zero point so that the spring brushes Q and Q^1 may be brought to coincide at the same angle. Sector O^1 is clamped to fixed wheel R by a bolt 11 through slot 10, which enables readings from zero of sector O to be determined.

As a load is applied to the brake the shaft of fibre disc L begins to lag behind the fibre disc K and the amount in degrees which this shaft lags is recorded by sectors O and O^1. The horsepower transmitted can be determined a degree or .5 degree by previously calibrating this shaft by means of lever N and M clamped to clutches I and J temporarily, M being fixed. The power supplied or in-put being found and the power absorbed obtained, the efficiency of the worm and worm gear and bearings can be found by dividing the out-put by the in-put. This apparatus appears to be accurate and the simplest and cheapest method of determining the efficiency of worm gears that I have thus far been able to find.

Fig. 10 shows an efficiency diagram plotted from results obtained from an efficiency test of a straight worm and worm gear as shown in the table appearing herewith.

Ed. Note—The Boston Gear Works, Norfolk Downs, Quincy, Mass., with which Mr. Burgess is connected, expects to undertake further tests up to 50 horsepower, using different lubricants, and with the gears mounted under conditions practically as they would have on the road.

FOR GOOD ROADS CONGRESS.

The first annual session of the American Road Congress will be held in Atlantic City, N. J., Sept. 30-Oct. 5. The congress will mark the consolidation of the conventions of 40 of the most important road organizations in the United States, including the American Association for Highway Improvement and the American Automobile Association. Atlantic City has tendered the use of the $1,000,000 pier for the gathering, and it is there that the meetings will be held. The National Association of Road Machinery & Material Manufacturers has voted to hold its exposition of materials and equipment in conjunction with the congress. The convention will be the largest of its kind ever held in this country, and will be attended by road builders, automobile men and civil engineers of world wide prominence.

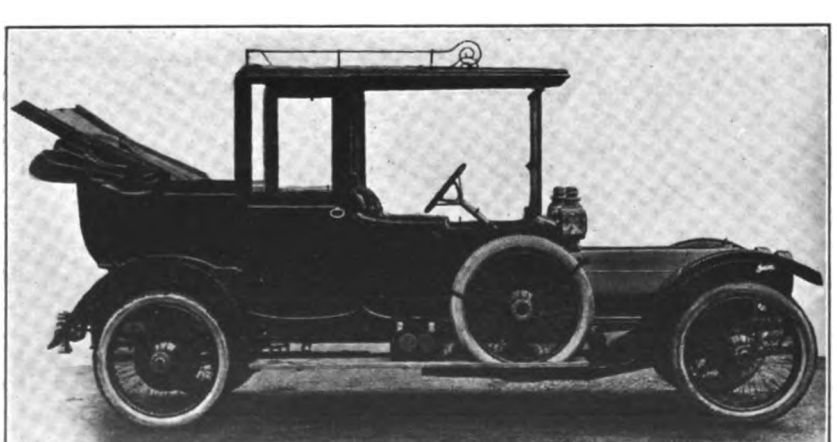
What is claimed to be the first and only car to have been driven from Land's End, England, to John O'Groats, Scotland, (from one end of Great Britain to the other), on the top gear throughout, under official observation of the Royal Automobile Club, was a six-cylinder Sheffield-Simplex, made by the Sheffield-Simplex Motor Works, Ltd., Tinsley, Sheffield, England. The total distance covered on this remarkable trip was 906 miles, and the test was most conclusive in every respect, particularly as there are numerous strenuous grades on the routes selected, and cities, with their congested traffic, were not avoided.

The company may be regarded as one of the few British concerns producing six-cylinder machines exclusively. Two chassis models are offered, one of 45 horsepower and the other of 25. The latter is shown herewith, but it should be remarked that there are no essential differences in the construction, aside from the bore and stroke of the motor, the method of casting the cylinders and the matter of cooling.

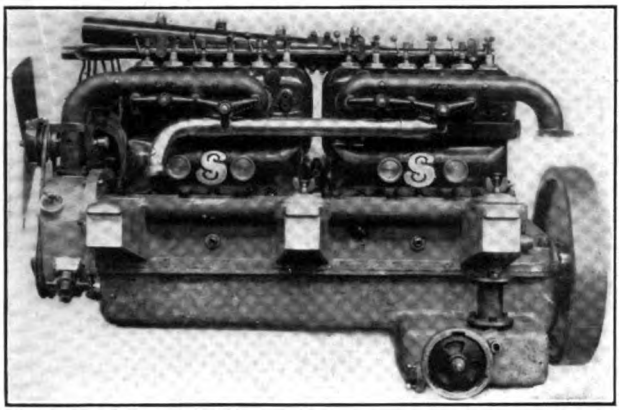


The larger engine has a bore and stroke of 4.5 inches, the cylinders being cast in pairs. The water circulation system is by pump. As will be noted by the accompanying illustrations, the 25 horsepower motor has cylinders cast in sets of three with the valves all on one side. The bore is 3.5 inches and the stroke five. Other differences are set forth herein.

A particular feature of the construction is the provision for operating the timing gears, magneto and oil pump by means of a worm. By reference to the end view, it will be seen that the castellated ends of the crankshaft and camshaft carry spiral gear wheels and are connected by a worm passing between them at an angle of 45 degrees. This is claimed to eliminate noise, and in addition, because of the rake of the worm, the magneto armature spindle connects with the wormshaft by means of a leather disc dog, which has a vernier adjustment to afford the utmost refinement in the matter of regulating the timing. The lower end of the wormshaft drives the toothed wheel oil pump through an ordinary jaw dog.

Ignition is by high-tension magneto and storage battery. The carburetor is a Zenith compensating instrument, with no moving parts to get out of order, it is claimed. Cooling is by the thermo-syphon system, and the maker feels it necessary to add that to insure that this shall prove satisfactory in every respect the water jackets and pipes are of extra large capacity. The radiator is circular in form and of ample dimensions. Cooling is still further aided by a belt driven fan.

The clutch is of the dry, multiple disc type, and it is held that the surface is such that very slight pressure is necessary to bring it into action. In connection with this member, the Sheffield-Simplex company calls special attention to the method of control, this being by a single push button type of pedal, which also operates the brakes. Of course, this scheme is by no means new in America, but it may be added that the maker of this car maintains that it possesses decided advantages, especially for the novice.



Another feature of the Sheffield-Simplex is the use of a transmission housing combined with the rear axle, a practise which has

Twenty-Five Horse Power Six-Cylinder Sheffield-Simplex Landaulet of British Manufacture.

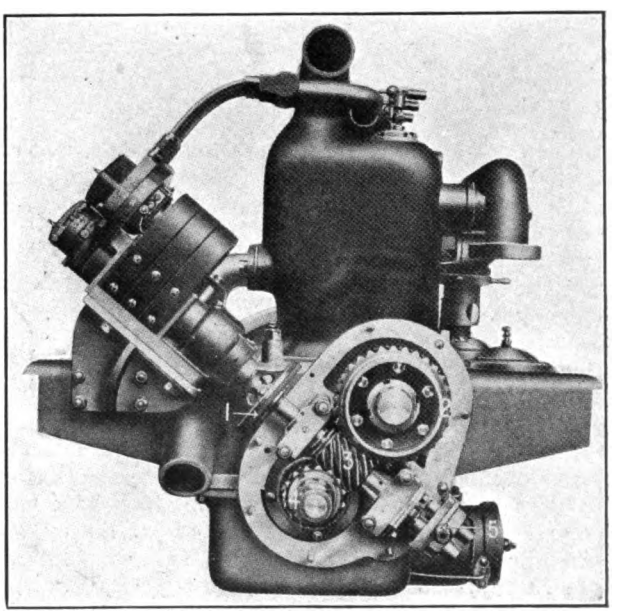
Digitized by Google

met with decided favor among well known American makers for some years. The whole system is enclosed, including the universal joint and propeller

Valve Side of 25 Horsepower Six-Cylinder Sheffield-Simplex Motor.

shaft, and works in a bath of lubricant.

It is interesting to note the advantages claimed for this, these being four in number. First, a large number of parts are dispensed with, and in consequence the arrangement is much more simple, and naturally, reduces weight without sacrificing strength. Second, the position of the gears reduces very considerably the strains put upon the main universal joint and the propeller shaft, thus reducing wear and tear. Third, the transmission forms one unit, and by virtue of the ball and socket form of attachment to the frame is free to move in any direction in order that the road wheels may freely accommodate their position to the inequalities of the road surface. Fourth, the position of the speed gears increases the unsprung weight on the rear tires.



In respect to this last item, the company makes the following argument: "The extra unsprung weight enables the tires to get a better grip on the road surfaces, and reduces very considerably the chief factor that causes the tires on driving wheels to wear so rapidly, that being slip between the tread of the tire and the surface of the road. Owing to lack of perfect adhesion, and the fact that in passing over hollows in the road surface the wheels do not follow the actual contour, causing them to leave the road momentarily, the tires of motor cars are continually slipping; this causes the road surface to act like a rasp on the tread of the tire, resulting in excessive wear. Every time the road wheel leaves the ground, which is continually taking place, the load being released, the wheel accelerates in speed, in a similar way that the propeller of a steamer does when it comes out of the water in a rough sea. On coming down on the ground again the resistance of the road reduces the speed of the wheel down to that the car is travelling, and it is at this moment that the rasping action takes place. The effect of this additional weight is to keep the road wheels from leaving the ground, and the extra pressure it creates on the tires provides better adhesion to the road surface, preventing the rasping action from taking place, this reducing the wear on the tires."

Two independent sets of brakes are employed, one being operated by foot and the other by hand. Both are internal expanding and act directly on the rear road wheels, each on a separate drum. Semi-elliptic springs are fitted both front and rear, with special shock absorbing springs at the rear. Wheels are of the Rudge-Whitworth detachable wire make.

Although the Sheffield-Simplex landaulet is presented herewith, it should be stated that the company does not manufacture bodies or do carriage work. However, it has arrangements with coach workers which will supply any type of body specified, and the officials are glad to take up the matter of design with prospective purchasers, or recommend a suitable firm to do the work.

★

Although similar to the laws governing the use of automobiles in this country, rules and regulations recently drafted and adopted in Japan are much more stringent. In making application for a license for business use, the applicant must give his registered domicile, actual residence, name and age, description of business, map of route of traffic, giving width of roads and location of stations. He must also give his business hours, fixed number of passengers and rate of fares if a passenger vehicle, and the capacity of freight and rate if for freight traffic. The kind of motor in car must be stated and construction plans must be provided, giving measurements and constructional details. Plans of brakes, controller and acces-

sories are required. Applicants for a license for private use are required to furnish the governor with the following information: Domicile, age, kind of

Digitized by Google

motor in car, measurements, and number and rate of car. Specifications for equipment are fundamentally the same as those in effect in this country and car

Sectional View of Sheffield-Simplex Clutch, Showing Internal Parts.

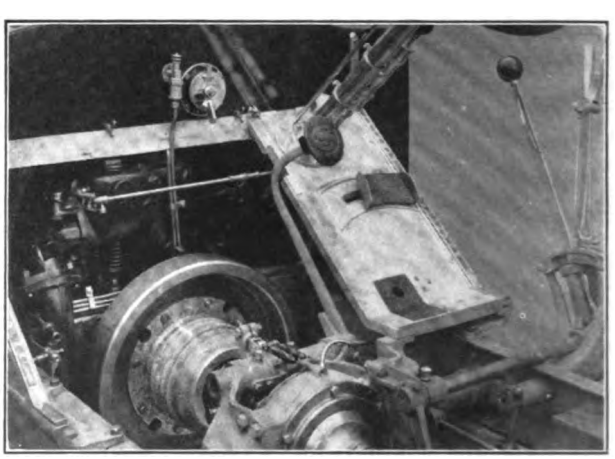
must be inspected at the government office at owner's expense. Car must also be inspected by the government once a year.

American motorists in Japan are apt to become confused in adapting themselves to the new traffic regulations. While the rules are much like those in this country there are several minor differences. In Japan the regulations require that motor vehicle drivers make a wide curve in turning to the right and a small curve when turning to the left when passing a corner. This is directly opposite to the rule in effect in this country.

★

The next Paris automobile show will open Saturday, Dec. 7, and close Sunday, Dec. 22. The exhibition, which will be held in the Grand Palais, will remain open to the public for 16 days. This year's show is organized by the automobile manufacturers for the automobile manufacturers, 80 per cent. of the profits to be shared by individual members taking part in the exhibition. Five trade associations—Automobile Syndicate, Cycle & Automobile Syndicate, Automobile & Accessories Syndicate, Bodymakers' Syndicate and Accessory Manufacturers' Syndicate—being represented. The Automobile Club de France figures only in an honorary capacity.

When all expenses have been paid, the profits will be distributed as follows: Forty per cent. to all exhibitors in proportion to the amount they have paid for rental of their stands; 40 per cent. to all exhibitors who for the previous six months have been attached to one of the five organizing syndicates; and 20 per cent. into the funds of the five trade associations in proportion to the amount they have paid in rental. Armand Peugeot is chairman of the committee of arrangements and M. Cezanne is the general secretary. Previous automobile shows in Paris have been exceptionally profitable.



While Prince Edward Island and Bermuda have consistently kept up the barrier against the automobile, practically the only places in the world where machines are barred, the chances that they will soon be admitted to the former place are good. A. R. Brennan, a prominent citizen and publisher in Summerside, P. E. I., has commenced an educational campaign to offset the feeling against motor cars due to reckless use of them when first introduced. Having in mind the campaign conducted by Benjamin Briscoe, president of the United States Motor Company, when motor cars were being condemned as an economic waste, Mr. Brennan has asked him for information, which Mr. Briscoe is forwarding as rapidly as possible.

★

According to the advices from a United States consul in a far eastern country, a company wishes to secure an agency for a reliable low priced car for two cities in which it has stores. The consul believes that there is a good field for moderate priced American made automobiles in his district. Full particulars regarding the opening can be secured from the Bureau of Manufactures, Washington, D. C. The number of the report is 9163.

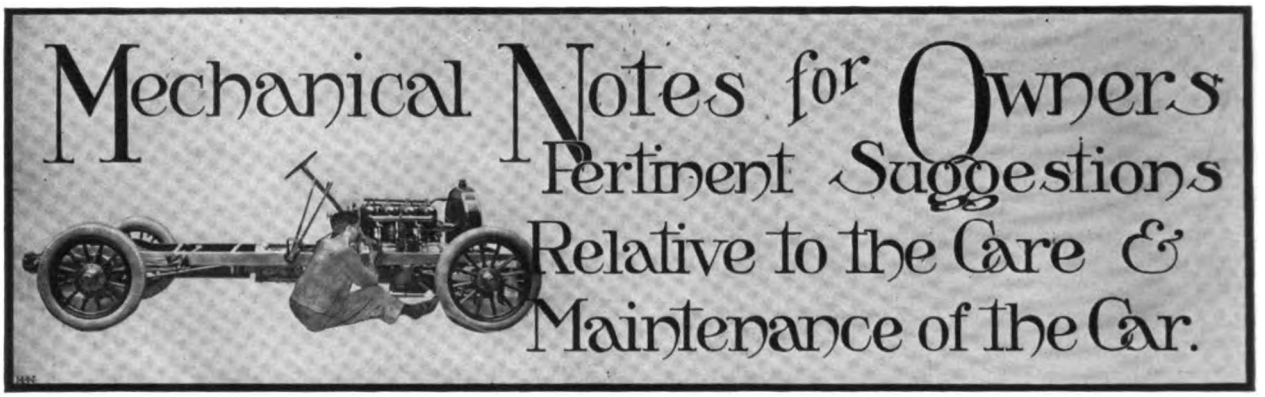
That American made cars are becoming popular in Russia is evidenced by the fact that the Nyberg Automobile Works, Anderson, Ind., recently received an order for 25 Nyberg six-cylinder, 60 horsepower models from Count Nicholas Kousnetseif of St. Petersburg.

★

Through the efforts of the Calgary Automobile Club, Calgary, Alta, Can., a provincial organization was formed recently. More than 2000 invitations were sent out to owners throughout the province, and although the response was proportionately small, the gathering of those interested was a representative one. George Tempest of Calgary was elected president. The vice presidents were elected from the various cities of the province as follows: Edmonton, Kenneth McLeod; Lethbridge, L. M. Johnstone; Medicine Hat, Charles Pingle; Red Deer, G. W. Green. One of the principal efforts of the society will be to secure legislation that will require more of the revenue from automobiles to be expended for the improvement of roads.

★

There is considerable interest among English motorists regarding a proposal for the formation of a co-operative society to deal with the gasoline question. Barely outlined the plan is as follows: A co-operative society to be formed; members of motoring organizations and other motorists to be invited to subscribe one guinea ($5.11) each; limited liability, one guinea share to each member; gasoline to be supplied to members at not more than one shilling (24 cents) a gallon; members to order not less than 20-gallon lots; stocking depots to be gradually established in all large centres, and touring members to be able to purchase from these at not more than one shilling, two pence (28 cents) a gallon.



Sixty-five members of the Institution of Automobile Engineers, the British counterpart of the Society of Automobile Engineers in America, enjoyed a visit to France, inspecting many of the motor car factories in and near Paris, the latter part of June.

★

C. A. Lull, representative of the Metzger Motor Company, Detroit, in Brazil, Argentina and the Latin-American countries, says that there is a wide field of export for the American maker in South America.

"Until recently," says Mr. Lull, "almost the entire business was controlled by Europeans. The Germans and French have practically monopolized the field, although they have been unable to produce anything of moderate price to compare with the average American $1500 car. South Americans are keen seekers for the lowest markets, and the medium priced American automobile is therefore in splendid demand."

REAR AXLE OILING DEVICE.

It is surprising to note the number of automobiles which are being operated with one of the rear wheels covered with dirty lubricant which finds its way out from the differential housing to the wheel drum whence it is spattered to the spokes and tire. Not only does the lubricant cause deterioration of the rubber, but the efficiency of the brakes is reduced greatly by the grease. This trouble is confined usually to one wheel although instances of both members being affected have been noted.

Many types of cars are fitted with rear axles having felt washers interposed on either side of the differential to prevent the lubricant from working out, but as the material becomes hard and worn, it fails to fulfill its function. Obviously, the remedy is to fit new washers but on some automobiles this occasions considerable work and many owners do not like to undertake the task of disassembling the rear construction. Removing the wheels and cleaning out the old grease affords but temporary relief and cutting down the amount of lubricant in the differential is not recommended.

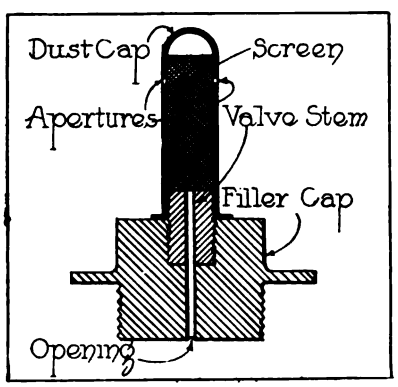

Fig. 1—Vent Device for Filler Cap of Differential.

Among the causes of the loss of lubricant is the expansion of the air within the differential housing, due to heat, which may be brought about by the weather or friction. The pressure exerted by the expanding atmosphere has a tendency to force the lubricant thrown up by the action of the gears into the axle housings, thence to the bearings where the surplus is thrown out by centrifugal force.

By relieving the pressure in the differential housing much of the leakage may be stopped, and at Fig. 1 is presented a device which was fitted to the casing by a motorist who experienced considerable trouble with leaking axles. The attachment was constructed of material found in the garage, and as will be noted by the drawing comprised a dust cap, valve stem and a piece of fine brass screening.

The filler plug on the machine was of liberal size and located well to one side of the centre of the differential housing. The plug was removed and drilled, then tapped to take a section of the valve stem which was cut off and screwed into the opening. Three apertures were next drilled in the dust cap in which was placed the brass screen as depicted in the drawing and the cap screwed snugly on the valve stem.

The screen was utilized to keep out any particles of dust or foreign matter and did not prevent the escape of the air from the housing, which found its way through the opening in the filler plug. The location of the latter was such that any lubricant thrown up by the revolving gears did not find its way into and stop up the vent. The motorist stated that the device not only prevented the lubricant from working out through the axle housing, but the supply did not require replenishing as frequently as formerly.

NOVEL REPAIR TO WATER MANIFOLD.

Many owners display considerable ingenuity in making repairs and an instance of overcoming what seemed at first to be a serious trouble was noted by the writer recently. The machine was an old model and the cylinders of the motor were of the copper water jacket type. The intake water manifold was retained by a bolt which passed through the manifold and was screwed into a spider as illustrated at Fig. 2 B. The supporting arms had become corroded and in removing the manifold, broke away.

At first the owner thought he would be obliged to purchase a new cylinder but decided before ordering the part to attempt a repair. The other three bolts would not draw the manifold up enough to make the member water tight even with the use of packing and cement. After considerable experimentation the kink outlined at A was adopted. It consisted of taking a

Digitized by Google

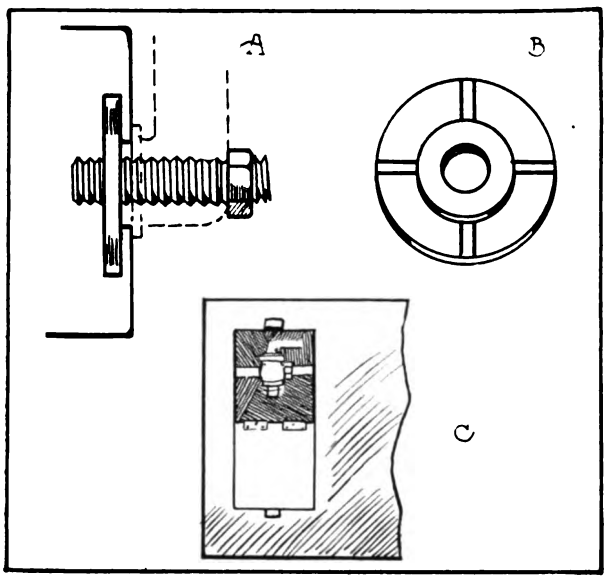

Fig. 2—Suggestions for the Owner Repairman: A, Novel Repair Made to Copper Water Jacket Bolt; B, Depicting Spider, the Arms of Which Had Rusted; C, How Operator Fitted Door to Reach Petcock in Fuel Line.

piece of metal nearly as wide as the diameter of the opening in the jacket and about .5 inch longer. A hole was drilled and tapped to take a bolt threaded its entire length. The plate was then slid into the opening and held while the bolt was caught and threaded up until snug. The manifold was then slipped over, a nut attached, and when screwed up this drew the manifold up tight. Upon testing it was found to be water tight.

HANDY PRIMING DEVICE.

Although it is rare that the cylinders will require priming in warm weather a suggestion for making a fuel container and one that is followed easily, is shown at Fig. 3. It comprises a dust cap, such as is employed to protect the valve caps of the inner tube, and the device is drilled as depicted at A. Many times the operator desires a little gasoline when on the road or in the garage for priming purposes and by utilizing the dust cap as outlined at B, the fluid may be poured into the priming cup without wasting. The device might also be employed for oiling a part by enlarging the hole, and would prove useful on the road and when the usual oil can is missing. The fact that the caps are perforated would not necessarily prevent their being employed on the tubes in the usual manner.

HANDY DOOR TO FUEL COCK.

Many owners make it a practise to shut off the fuel supply to the carburetor upon leaving the car for the night while others observe the same rule if the machine is standing idle for any great length of time. This precaution is brought about by the carburetor flooding in the past and closing the main line prevents a possible loss of fuel. On some cars the shut-off valve is reached easily while on others it is difficult of access and many owners while wishing to close the petcock dislike to crawl beneath the automobile to reach the member.

An operator of a model T Ford who lost considerable of his fuel through the carburetor flooding, fitted the trap door device depicted at Fig. 2 C. The board under the seat was sawed out opposite to the petcock and inside hinges and a catch fitted. The door is hardly noticeable, and by it the operator was enabled to reach the shut-off valve easily. Where this method may not be applicable, a petcock could readily be installed near the carburetor and between the device and the tank. To utilize it, however, the hood would have to be raised.

WHY WATER IN COOLER HEATS.

Many owners of cars complain that the water in the circulating system heats unduly now when it did not boil in cooler weather. While there are several causes for this, such as impeded circulation, boiler scale in the radiator, dirty radiator, pump not working properly, weak spark, etc., few operators ever think to change the water.

The utilization of hard water is responsible for the trouble as after repeated heating it forms a boiler scale in the water jackets of the motor which is deposited in the radiator in the form of a fine, brick colored dust. This accounts for the reddish hue of the water when it is drawn from the cooler, and when this condition exists the circulating system should be cleansed thoroughly by using a saturated solution of

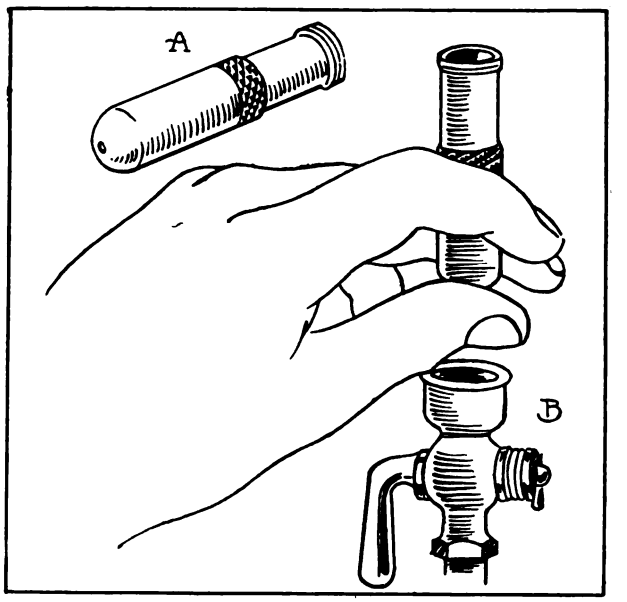

Fig. 3—Easily Made and Inexpensive Priming Device Constructed from a Dust Cap: A, How the Member Was Drilled to Permit Flow of Fuel; B, Depicting Method of Operation.

Digitized by Google

common washing soda, afterwards thoroughly flushing out the system with clean water.

The water should be drawn off and the system flushed out at least once a week, and oftener if the motor shows signs of undue heating, provided, however, the other components of the circulating system be not at fault. In operating in hot weather it is a good plan not to fill the radiator to the top as when the fluid heats it expands, leading the novice to think that the water is boiling. Fill within a couple of inches of the top and if operating for any length of time on the low speed the water boils, remove the cap, giving vent to the steam which will aid in keeping the fluid from boiling out.

SAWDUST USEFUL IN GARAGE.

Boxes of sawdust or fine sand are useful and should be included in the equipment of the garage, particularly as the former material possesses absorbing qualities. When oil or grease has been spilled on the floor a few handfuls of the sawdust should be thrown over the lubricant and allowed to stand a little while before it is swept up. If lubricant drips from a machine and a drip pan is not utilized, the sawdust may be employed. Sand is valuable in the event of incipient fires as the material will smother flaming gasoline or oil.

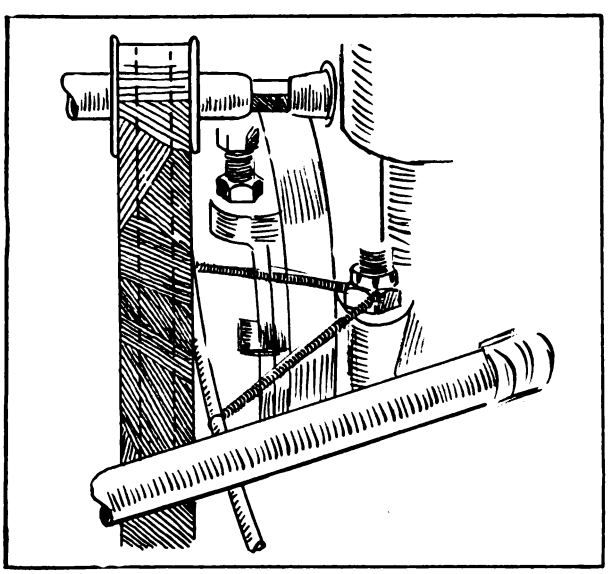

Fig. 4—Showing How a Light Spring Was Attached to Timer Rod to Retain the Member in Normal Position.

FORD TIMER ROD KINK.

Lack of attention in the matter of lubrication is responsible for wear and improper operation of many of the components of the motor car. It is surprising to note the number of owners who give no other attention to the machine than that of filling the fuel tank and oiler, a practise which results in the development of considerable play in certain parts.

An instance of this kind is noted on some model T Fords, the timer of which is actuated by a rod having ball and socket connections. These members are not subject to wear if attended to properly, but if the sockets become filled with grit and are not lubricated, play will develop, causing the rod to come in contact with the fan belt, and wearing that member as well as the rod.

The remedy is to fit new connections which are inexpensive, but the trouble was overcome by one owner who attached a spring as outlined at Fig. 4. A light spring was tied in the centre to the rod and the ends fastened as shown in the drawing. The tension was very light, just sufficient to hold the rod away from the fan belt, and the spring was divided into two sections to maintain the rod as desired when the timer was advanced or retarded in operating the car.

SETTING SPARK PLUG GAPS.

Few owners ever give the spark plugs the attention these devices require for efficient operation of the power plant. The majority of drivers know by heart the rule that the gap of the magneto plug should be about .015625 inch and that of the ordinary plug about .03125. Much has been said and written relative to the importance of adjusting the gaps, but having once set the points many believe that no further attention is necessary.

While it is admitted that a high grade plug will give efficient service and will not require frequent adjustment there are plugs the electrodes of which are susceptible to high voltages and in time burn away, enlarging the gap and consequently affecting the spark. It is obvious that the larger the gap the more pressure is required to force the high-tension current to bridge the space. The timing of the spark is also changed to a certain extent, especially where the battery is the source of current. It is an excellent plan to remove the plugs occasionally and readjust the gap, employing a gauge to insure accuracy. It is surprising how smoothly a motor will run after the plugs have been adjusted properly.

GROUNDING MAGNETO.

Few operators of machines equipped with high-tension magnetos understand more concerning their operation than the throwing of the switch lever, and in the event of trouble with the wiring are at a loss to know how to proceed to remedy the fault. To interrupt the flow of the current to the spark plugs, the primary circuit of the magneto is grounded, or short circuited.

This is brought about by connecting an insulated wire between the terminal on the contact breaker box and the frame of the car, and incorporating a switch in the line. When the switch is thrown to "off," it

Digitized by Google

is really closed, and the magneto ceases to generate a high-tension current. If the wire leading from the terminal to the switch or the lead from the latter to the frame becomes chafed, and comes in contact with any metal of the chassis, a ground is produced. If the magneto be supplying current for ignition, it is obvious that the engine will stop.

An instance of an operator being unable to switch off the ignition was noted recently by the writer, and the driver had to stall his engine when he desired to stop. An inspection of the switch showed that the wire leading from the terminal on the magneto had worked loose. When this lead was replaced the difficulty was eliminated.

In the event of trouble of this nature the operator should bear in mind that the motor can be stopped by grounding the primary current which may be done by taking a screw driver or strip of metal and making a connection between the terminal on the circuit breaker and the most convenient metal part of the chassis.

LION COMPANY LOCATES.

The Lion Motor Car Company of Adrian, Mich., whose plant was destroyed by fire, June 20, is again in the field. A reorganization has been effected and the new plant obtained. It is claimed that the first car will be marketed within a very short time. Within 90 days, it is announced, the company will be turning out its full quota of cars. The firm is to remain in Adrian, despite many reports to the contrary. The Industrial Association of the city has guaranteed $100,000 to keep the factory, and the new plant is considerably larger than the one destroyed. The factory organization remains practically the same.

UNITED STATES TIRES.

All five brands of the United States Tire Company's tires, United States, Hartford, G & J, Morgan & Wright and Continental, are to be merged into one brand, the United States, this fall, according to an indication by Elisha S. Williams, president of the Rubber Goods Manufacturing Company, which is a subsidiary of the United States Rubber Company, and which owns the United States Tire Company and the plants grouped in it.

It was predicted when the new brand was created a few months ago that a consolidation would eventually result, and that the new one would supersede all others. Although it is said that after fall there will be but one brand, there will be several grades to meet market conditions.

According to information from Mr. Williams no decision has been reached regarding a location for the new tire factory that the United States Tire Company is to erect at a cost of from $3,000,000 to $5,000,000. He intimates, however, that it will probably be built in the West.

COMING EVENTS.

August.

THE FOUR-SPEED TRANSMISSION.

(By W. H. Cameron.*)

IT MAY sound strange when I make the prediction that the next radical change in automobile engineering will be the general adoption of the four forward speed transmission. By that I mean that in my opinion the four-speed transmission is bound to become generally used in all good American cars.

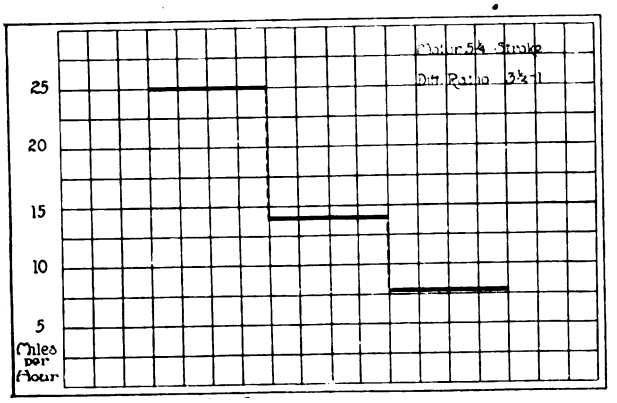

Fig. 1—Three-Speed Transmission, Indicating Gap between Second and High—Looks as If Something Were Missing.

Today it is found in this country only in the highest priced cars. You can count on the fingers of one hand the cars selling under $3000 that now have four speeds forward. Abroad, where special reasons have forced the use of the four-speed transmission in the large majority of cars, its advantages are better understood.

One reason for its use on foreign cars is the extremely small bore of cylinders, due to the fact that the tax is graded by the size of the bore. An American car of more than four-inch bore has little demand in England where a bore of three inches and a fraction is generally used with an extremely long stroke, to give the maximum horsepower.

Under such conditions the four-speed transmission is positively essential, both to economize the power and to gain the required flexibility of control. Its use under these conditions, however, only serves to illustrate the actual money saving in fuel and less strain upon the machine, as well as the advantages in driving which will come with the widespread adoption of the four-speed gearbox in America. For the same engineering principles apply in our case as in theirs.

Before passing the point of economy, let me say I believe that the tendency in America will be decidedly to smaller bore. This is due to the fact that everybody knows gasoline is becoming scarcer, and is sure to mount in price. I think the small bore is coming, even with the effort to popularize the six-cylinder car. The popular six-cylinder car of the future will be one with about the same piston displacement as the standard fours of the present.

*Member Society of Automobile Engineers.

Question of Cost in America.

The four-speed gearbox has been confined to high priced cars in America, primarily because of its prohibitive cost. Engineers, and I may say manufacturers, almost unanimously admit the great advantage of four speeds over three, but the cost question has caused the delay until the demand of car buyers has become imperative. It means a complete change of design—more gears—wider gear centres—a big expense for the improvement, when all are totaled.

But the advantages to be gained from it are certainly so manifest, so great that it is a question of only months when it will be generally accepted. And with our roads, the four-speed transmission comes to general practise none too soon. Motorists generally realize now, that the life of a car depends upon its use and abuse. It does not take a car owner long to reason to the fact that making a car put forth every ounce of power on frequent grades is highly detrimental.

"Learn to control your car exclusively by the gas, as far as possible," says the instructor in motoring, to the school. The salesman says the same thing to the beginner who has purchased his car, in 99 cases out of 100. Everybody who gives advice on running a car says it, thereby admitting that something is wrong, or lacking in the transmission. Yet everybody realizes on a moment's reflection that the transmission is the logical first means for the control of the speed.

Now it takes long experience and special aptness —I may say genius—for driving to know just how far to throttle in regulating a car by gas. Few ever learn it perfectly. The driver who does it with any degree of skill, knows his car like a human friend and brother, and is also guided by some sixth sense of intuition.

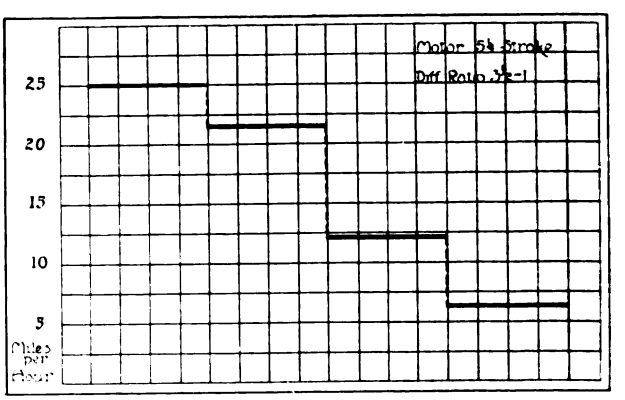

Fig. 2—Four-Speed with Indirect Fourth—Third and Fourth Very Close Together; and Yet in Use They Are Really Closer, Due to Inefficiency of the Gears.

Digitized by Google

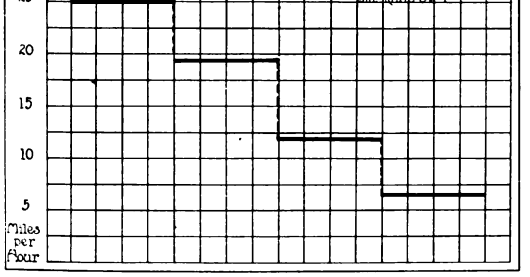

Fig. 3—Regarded by Writer as the Proper Ratios with All Speeds About Equally Spaced.

book but in not a few cases to human life. It costs money to pull the engine speed down until the car almost quits on high, and then to race the engine to pick up on second, as is so commonly practised.

We have grown used to the sight of the driver on high gear, killing his motor at street crossings, street car tracks and railroad tracks, by throttling down before he can get his clutch out. If instead he slips into third speed on a proper four-speed transmission, he has a gear ratio which is practically the same as a 4.5 to one rear axle—by having which, as any one knows, the car can easily be throttled down to two or three miles an hour, and still pick up quickly.

By this time it should not be necessary to explain that the basic purpose of four-speed transmission is not to satisfy a mania for more speed. This was a common error when the four-speed transmission was rare practise.

Four-speed transmission provides an efficient, feasible and logical control of the car—a control not based on guesswork, but upon an accurate, proved and dependable gearbox, built in accordance with universally acknowledged mechanical principles, and in accordance with the best engineering practise the world over.

It provides this control without wasting the fuel—without racing the motor, and consequently with far less vibration. It relieves the motor of undue strain, especially in taking heavy grades. With four speeds (the direct drive being on the fourth) the long sand stretches—the heavy mud roads—the miles of axle-deep slush—the hills and mountains may be negotiated without fear of punishing the motor, in the way that now works havoc, and shortens by years the life of the best car built.

More Pleasure in Driving.

Unless one has actually driven with a four-speed transmission, he does not know the satisfaction and pleasure that it adds to driving. To those who have not tried it I would say: Make a test of two cars, everywhere, every day, not only to climb grades, and not only to do away with unnecessary engine racing, but to provide a really essential speed, between second and high where the gap now exists.

Grade climbing is one of the problems most satisfactorily solved by the four-speed gearbox. Every motorist knows that unless he has an engine on which he can depend for a practically unlimited pull, he will find the inclination of many grades just a trifle too much for his top speed. On such a grade with a four-speed gearbox he can drop to third speed and it takes his car up like a bird. With a three-speed car, he has to drop from top speed to second—and he makes an awful drop—in fact, almost 50 per cent. lower than high.

If you have had this experience, you know that resigned expression with which everybody settles back in the car, to make the best of it until the car can be thrown into high gear. The same condition is encountered in many roads which are just a little too heavy for top speed. The funeral pace then has to be taken on second speed, although the car is actually capable of much better speed on these roads.

We shall understand the necessity of the four-speed transmission more perfectly, if we say that while the speed ratios of a proper four-speed car are 1, 2, 3, 4, (the fourth being the top speed) the speed ratios of a three-speed car are really 1, 2, 4—the gap between the second and high being so great that there is really no third speed. So when we put in a four-speed gear box we are actually adding a third speed to the car.

I have talked to many veteran motorists, and they agree with me that the four-speed gear box is needed

Table No. 1.

Speed	Transmission Ratios	Ratios—Engine to Wheels

Direct Drive on Fourth, the Best.

The greatest question in four-speed transmission is the ratios of the gearing, or the number of times the motor must turn over to the number of revolutions of the rear wheels. The subject has engaged the attention of the leading engineers in Europe and America for several years; but it is only lately that they have practically agreed as to the direct drive.

There are two types of four-speed transmissions: One direct on third speed, the other direct on fourth. The latter is generally conceded to be greatly in advance of the former. This is overwhelmingly proved by the practise on the great majority of cars now using the four-speed gearbox.

Of 157 four-speed foreign cars, 132 have the direct drive on fourth. Of the American cars now using four speeds, 75 per cent. have the direct drive on the fourth. In fact, as the four-speed gearbox gains in favor the indirect fourth will drop out overnight.

Difference Shown by Table.

A study of the tables and diagrams shown herewith will enable the reader to see the difference at a glance. Table 1 shows a common three-speed transmission which is about what is fitted to 85 per cent. of the three-speed cars. It will be noted that 3.5 rear axle gear ratio is used in all three tables. If the driver rushes his car at a hill on the high gear and has to change down he goes to second, which is almost 50 per cent. lower than high.

It will be noted that in this transmission the first or low speed is only 11.20 to one. This is the reason that so many cars are forced to back over the stiffer grades if there is no other way round. The reverse of course is lower. This is the result of transmission design.

Take the next table now, which is No. 2. It shows a transmission of a well known and popular car. This is for the motorist who thinks he wants to burn up the roads, and who buys a car with an indirect fourth. He overlooks the fact that he loses almost all that he thinks he gains, through the inefficiency of the gears, and has two speeds which are almost alike. It also will be noted that he has not much better second and low than his friend with the three-speed.

The Ideal Transmission.

Now, the ideal transmission, in my opinion, is shown in Table No. 3. It will be seen that, when it is necessary to change from fourth to third, a speed is obtained which enables the car to go over the hill at a fairly good rate.

Also note that the second in this is almost between the first and second of the others, consequently if the car is fitted with a good clutch, the operation for all ordinary driving resolves itself down to a three-speed job (as the second can be used for starting on the level) leaving the extremely low first and reverse for emergency.

In the above, I have but briefly outlined facts on which the judgment of the best engineers at home and abroad is based, in favor of four-speed transmission. Taking all these facts (and the showing of the tables and diagrams herewith) into intelligent consideration, everyone must realize that four speeds, with the direct drive on the fourth, is the immediate step in the evolution of the leading cars.

GOODYEAR BOOKLETS ISSUED.

The Goodyear Tire & Rubber Company, Akron, O., recently issued two booklets, entitled "Get All the Mileage from Your Tires," and "Make Inner Tubes Last Longer." Both are small, but contain a fund of information appertaining to its own particular line. The company also recently issued the second number of "Aviation." This contains several photographs of leading aviators and aviation meets, and is extremely interesting.

BARNES RESIGNS TWO OFFICES.

Claire L. Barnes resigned as third vice president and a member of the board of directors at a recent meeting of the board of directors of the Motor & Accessory Manufacturers in New York City. William H. Crosby was elected as a member of the board of directors, to fill the unexpired term of Mr. Barnes, whose office will continue until January, 1914. F. C. Billings, already a member of the board, was elected as third vice president, to fill the unexpired term of Mr. Barnes, which office will continue until January, 1913. The following concerns were elected to membership: Hood Rubber Company, Boston, Mass.; the Lefever Arms Company, Syracuse, N. Y.; the American Hardware Corporation, New Britain, Conn.

HAYES MADE ADVERTISING MANAGER.

Frank M. Hayes, who has been in the employ of the Luke Horsfall Company, Hartford, Conn., for the past three years, resigned recently to accept a position as salesman and advertising manager of the Lovell-McConnell Company, Newark, N. J., maker of Klaxon and Klaxonet automobile horns. When he left the Hartford concern, employees in the plant presented him with a travelling bag.

DURGIN WHEEL PLANT MOVES.

As a result of efforts on the part of the Commercial Club in Hutchinson, Kan., the Durgin Auto Wheel Company has decided to move its plant from Lawrence, Kan. The move was made as the plant required greater facilities. The Durgin wheel is made so as to abolish tire blow-outs, prevent skidding and yet be durable. It has a tire made of selected blocks, which give it exceptional wearing qualities.

IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

ELECTRIC SERVICE VEHICLE CLUB.

The Electrical Vehicle Club of Boston, which had its inception April 3, 1911, recently ended its activities for the present season with a dinner. The members have held weekly meetings since September, at which addresses have been made by authorities on haulage, and especially electric transport service. The main object of the club is to bring before the business men of New England the advantages to be gained by the use of the electric service wagon.

EDWARDS MAKING TESTS.

Commissioner Edwards of the New York City street cleaning department recently secured an appropriation of $10,000 for use in testing motor vehicles in connection with the removal of ashes and garbage. Instead of making purchases, he has rented six machines and they will remain in commission until the close of the fiscal year. He estimates he will be able to save the city 52 cents a ton on this work in the future.

USES G. M. C. AT SAVING.

By the use of a G. M. C. five-ton truck, made by the General Motors Truck Company, Detroit, it is estimated by the Staf-O-Life Feed & Milling Company, New Orleans, La., that a saving of $4200 results when a comparison is made with the work formerly done by horse drawn vehicles. The truck carries a load of approximately 10,000 pounds, and covers a distance of between 40 and 50 miles a day, consuming from seven to eight gallons of gasoline.

GARFORDS IN NEW YORK.

New York City recently placed in commission its first motor driven patrol wagons, three Garford machines, made by the Garford Company, Elyria, O., being assigned to duty below 14th street, replacing nine horse drawn vehicles. An illustration of one of the new cars is shown herewith.

The chassis is the standard Garford public serv-

Garford Patrol Recently Installed by New York Police Department, Equipped with Motz Cushion Tires.

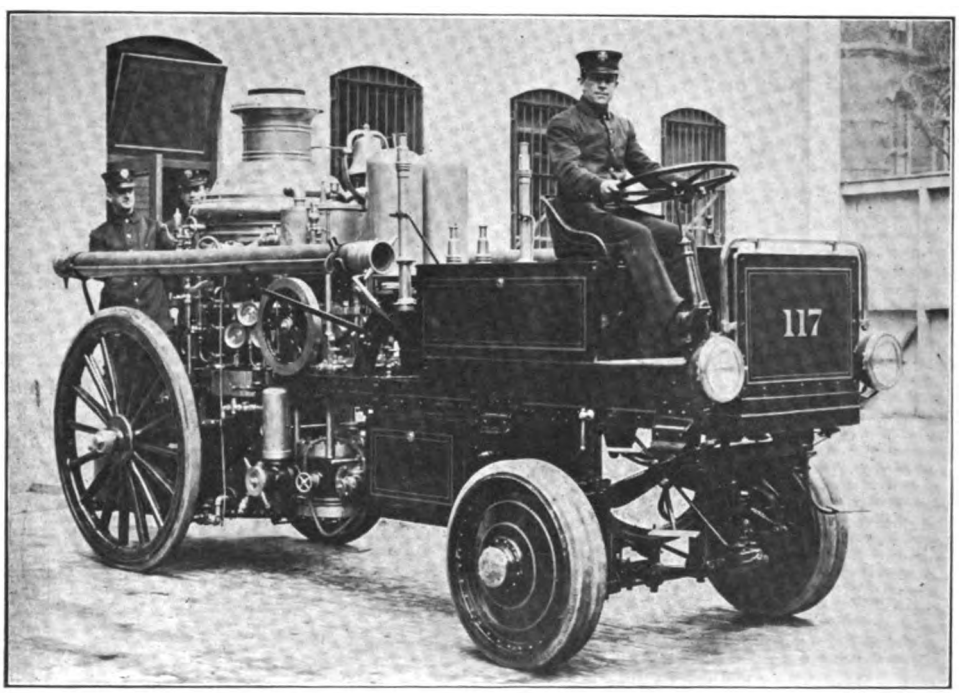
ice type, with 40 horsepower motor, four-speed transmission, pressed steel frame and 145-inch wheelbase. The machines are all equipped with Motz cushion tires, made by the Motz Tire & Rubber Company, Akron, O. Each set carries a guarantee for 10,000 miles, which is equivalent to nearly two years' service.

PIERCE-ARROW CARRIES LUMBER.

The Capitol City Lumber Company of Hartford Conn., has devised a means of loading and unloading a Pierce-Arrow five-ton truck, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., so that both operations require not more than five minutes, five to six tons of lumber being carried at a time. This means more than double, and almost triple the amount that could be handled by a pair of work horses. The truck was designed by the Miner Garage Company, Hartford. An extra long wheelbase has been provided for a regular Pierce-Arrow chassis. The body is equipped with rollers which permit the load to be dumped in one minute. The lumber to be delivered by the truck is assembled on a feeder at the yard, and a system of rollers has been devised, whereby the lumber can be moved to the body of the truck in about three minutes.



COLVER LOCOMOBILE REPRESENTATIVE.

The Locomobile Company of America, Bridgeport, Conn., recently secured Fred F. Colver to have charge of its truck department in its New York branch, and this feature of the business in the surrounding territory. Mr. Colver has been connected with the automobile industry for eight years having been with the Pope Manufacturing Company, the Buick Motor Company and the Studebaker Corporation.

TESTS COUPLE-GEAR TRACTOR.

Tests of what is believed to be the first electrically driven fire engine in America, were recently undertaken by the department in New York City. All experiments to date have been successful, and the machine is now in daily use at the De Kalb avenue station.

A horse drawn steamer was converted by the removal of the front wheels, and all equipment forward of the so-called "gooseneck," and the substitution of a two wheel Couple - Gear gas - electric tractor, made by the Couple - Gear Freight-Wheel Company, Grand Rapids, Mich. A general idea of the machine's appearance can be gained from the accompanying illustration.

Couple-Gear Tractor Fitted for First Electrically Driven Steam Fire Engine in America.

The engine is driven by current from the battery, located above the deck, and supplied to motors contained in each of the forward wheels. These motors are each three horsepower and will take a momentary overload of 200 per cent. so that for a brief period 18 horsepower may be utilized. It is estimated the engine may be driven 22 miles on a single charge, and at a rate of 20 miles an hour when occasion requires.

EXPERIMENTS WITH G. M. C.

Interesting experiments have been conducted in Detroit with a G. M. C. truck, made by the General Motors Truck Company of that city. The machine was used for the delivery of asphalt, proving that not only can unloading be accomplished more quickly, but the speed with which deliveries are made allows the workmen to spread the material while it is hot, thereby insuring a much improved road surface. Recently, work was done 3.2 miles from the asphalt plant. Trips were made by the truck every 55 minutes, carrying five tons of material sufficient to spread over an area of 70 square yards. Eight trips a day were made.

Digitized by Google

42 tons of asphalt being delivered. The distance travelled was 50 miles a day.

THE SILENT CRESCENT.

The ease with which the operator can gain access to the motor is one of the most notable of the many desirable features of the Silent Crescent, made in one, two and three tons capacity by the Crescent Motor Truck Company, Middletown, O. While the engine is located under the seat, this unit is divided so as to be swung outward and backward, an operation which requires but a few seconds. Application has been made for a patent on this ingenious arrangement, which is brought out clearly in the illustration of the vehicle which is presented herewith.

The motor itself is of the well known Rutenber make, designed especially for commercial vehicle service, this being a four-cylinder unit with bore of 4.125 inches and stroke of 4.25, giving a rating of 30 horsepower. Ignition is by Remy magneto, although an option of either Bosch or Eisemann is given if desired. The carburetor is a model L Schebler. Cooling is by gear pump, driven off the right hand side of the engine. The radiator is a Werner, suspended by a spring device which absorbs all road shocks. Lubrication is by a combined splash and force feed circulation system.

Novel Provision for Power Plant Accessibility on Silent Crescent Models.

The clutch is a tapered cone, fitted with adjustable springs. Three speeds forward and reverse are provided with the selective sliding gear transmission, which is made as a unit with the jackshaft. Final drive is by roller chains. Liggett type service brakes are fitted to the rear wheels and operated by pedal, while the emergency members are Duplex, fitted to the jackshaft and actuated by lever. Full elliptic springs are employed, both front and rear. The wheelbase is 108 inches and the tread standard, 56 inches. The net weight of the chassis is 3600 pounds and the body carrying space is 60 by 108 inches.

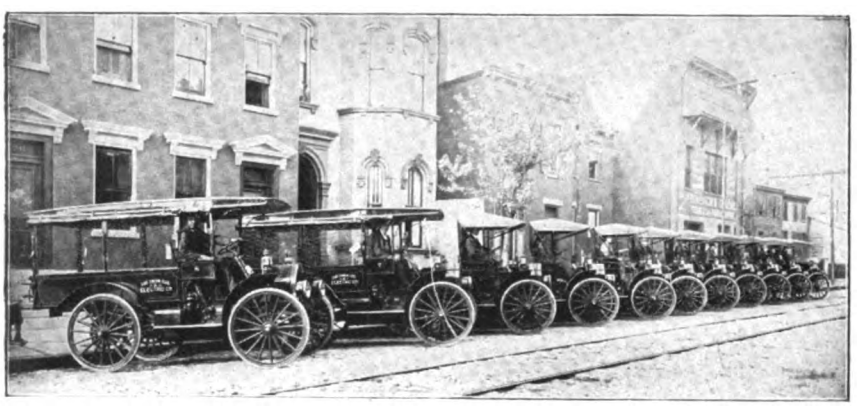
STUDEBAKERS FOR FIREMEN.

The fire department in Camden, N. J., recently purchased three Studebaker roadsters, made by the Studebaker Corporation, Detroit. They have been equipped with chemical apparatus, and respond to all alarms of fire. The department officials estimate that they can make 60 miles an hour whenever traffic conditions permit.

PEERLESS MAKES FINE RECORD.

A Peerless truck, made by the Peerless Motor Car Company, Cleveland, O., recently made a unique record in Worcester, Mass., being credited with the delivery of 60 tons of coal in 9.5 hours. The truck had a special body, unloading mechanically without the aid of shovels. The coal was hauled from the yards of the dealer to the State Hospital and the Worcester Technical School. The dumping body was so constructed that following the discharge of the load it righted itself while the machine was gathering speed on its return to the yards.

LONG MILEAGES FOR WORM GEARS.



Totals of 58,000 and 124,000 miles are recorded for two worm gears used in two motor trucks in England. The one with the 58,000 miles to its credit is used by a prominent biscuit manufacturing concern, and the other is operated by the London Omnibus Company. As this type of final drive was not introduced in this country until last year, when the Pierce-Arrow Motor Car Company, Buffalo, N. Y., utilized it in the manufacture of its five-ton model, no such

Digitized by Google

mileage can be shown in this country. Well known engineers believe there is nothing in American service, however, that would prove a bar to similar records in this country, and some high mileage feats on this side of the Atlantic are anticipated in the next few years.

AUTO-WAGONS IN FLEETS.

From the photograph reproduced herewith, it is possible to judge the growing popularity of the International Auto-Wagons, made by the International Harvester Company, Chicago. Many concerns have come to recognize the worth of these cars for light delivery purposes, as is proved by the fact that a large number have been ordering them in fleets of late. The accompanying picture shows 11 of these machines, which were recently sold to a large concern in Cincinnati, O. The company reports another order for 11 by a public service company in that city, which plans to entirely eliminate horse drawn vehicles from its service, while a Chicago house recently placed 21 in commission.

Fleet of 11 International Auto-Wagons Delivered to Concern in Cincinnati, O.

SAVING CREATED BY G. M. C.

Comparative figures compiled by the Schwabacher Bros. Company, Seattle, Wash., show that its G. M. C. truck, made by the General Motors Truck Company, Detroit, has been utilized in the delivery of groceries for the past six months at a decided saving over the former method where horses were used. The truck cost averaged $150 a month, including driver's wages, garage expenses, oil, gas, tire replacements and all other incidentals. During this period it carried 1,950,000 pounds of goods. The total cost of delivery a ton was 93 cents and the average price for team deliveries as charged by the transfer companies in the same territory is from $1 to $2 a ton. The shipping clerk says that the average cost a ton for the territory covered by the truck would be $1.60 by team. This gives the truck credit for a saving of 67 cents a ton.

LOZIER MODELS NEXT WINTER.

Although the Lozier Motor Company, Detroit, had planned to place a five-ton truck, a model of which was displayed at all the big shows last winter, on the market this year, the increase in the pleasure car business made it impossible to do so, according to a statement made by President H. A. Lozier of the company. It is the intention of the concern, however, to begin the manufacture of trucks the coming winter. With an average overload of 30 per cent. one of these Lozier models was run continuously for 488 hours recently. After this and many other severe tests, the only change decided upon was to enlarge the diameter of the rear wheels.

PEERLESS EFFECTS BIG SAVING.

The Howell Condensed Milk & Cream Company, Jersey City, N. J., recently placed in commission a Peerless five-ton truck, made by the Peerless Motor Car Company, Cleveland, O., which it estimates will save $3000 a year in ferry tolls alone. The company hauls every night a large quantity of milk from Jersey City to a point two miles in the interior of Staten Island. The truck makes two trips with 100 40-quart cans, each weighing 110 pounds.

The present route covers a run of eight miles from the distributing station in Jersey City to the Bergen Point ferry and a run of two miles after reaching Staten Island. This makes a round trip of 20 miles or 40 miles for the night. The ferry tolls are 35 cents for each passage or $1.40 for the night.

Teams which formerly did this work could not take this route because they could not cover it in time to deliver the milk sufficiently early. Two teams formerly left the distributing station and proceeded to New York by the way of Erie Railroad ferry. The toll was $1 for each team. From Manhattan it was one mile to South ferry, and the ferry toll from this point to Staten Island was $1.50 for each team. This amounted to $10 a night.

USES AN AUTOCAR.

A truck, fitted with a special body, made by the Autocar Company, Ardmore, Penn., was recently placed in commission by the Massachusetts Institute of Technology, for use in the collection of ashes. The machine is equipped with an end-dumping device, the front of the body being raised by a chain belt operated by a hand crankwheel. For loading a line crane

Digitized by Google

with block and fall is utilized. A large ash barrel is easily lifted into the wagon and emptied by use of the crane. The body is of pressed steel, and the chassis has a capacity of about 3000 pounds. The driver's seat is over the motors so as to give a maximum body length with a minimum wheelbase.

NEW WOLVERINE-DETROIT.

The Pratt, Carter, Sigsbee Company, Detroit, Mich., recently placed on the market an 800-pound delivery wagon, which was given its initial test on the recent 703-mile run of the Wolverine Automobile Club from Detroit to Indianapolis and return. This latest addition to the product from the Michigan city will be known as the Wolverine-Detroit. The accompanying illustration shows it on its recent trip.

It is fitted with a single-cylinder, four-cycle, water-cooled motor, having a bore of 4.5 inches and stroke of 5.5 inches. The thermo-syphon system is used for cooling, lubrication is by constant level splash, ignition by jump spark with coil and multiple dry battery, and carburetion by a float feed automatic type vaporizer, with a single gasoline adjustment. Drive is by friction discs. The tires are 32 by 3.5-inch pneumatics.

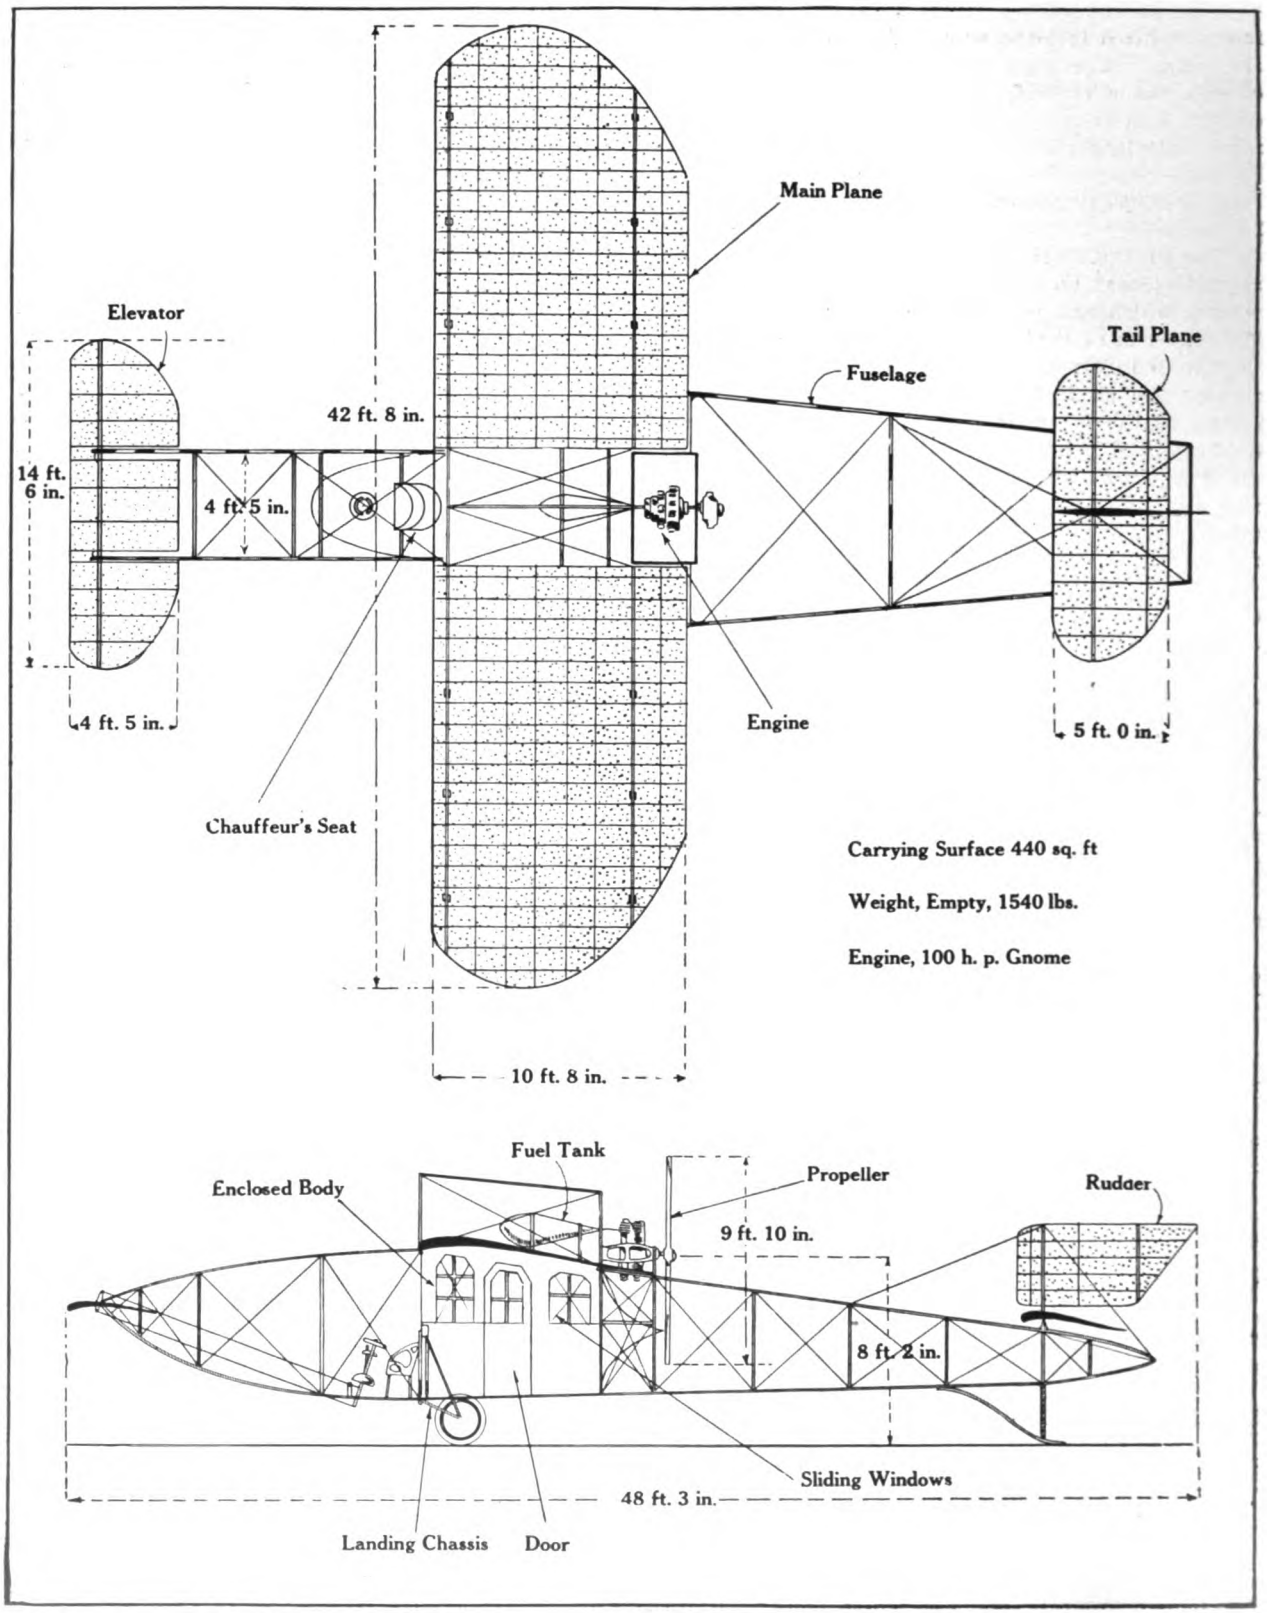
Throughout the trip mentioned, the car carried a load of 1105 pounds, at an average speed of 17 to 18 miles an hour. An average gasoline consumption of 20 miles to the gallon was recorded. Four men accompanied the vehicle, these being W. C. Pratt, H. C. Carter, N. J. Fleming and G. E. Buckley.

Wolverine-Detroit Light Truck Acting as Baggage Wagon on Recent Cross Country Tour.

EMPLOYS TWO LOCOMOBILES.

Two Locomobile five-ton trucks, made by the Locomobile Company of America, Bridgeport, Conn., have been working all spring and summer in connection with the construction of a 4,500,000,000-gallon reservoir in Easton, near Bridgeport. Some interesting figures comparing the work they accomplish with that formerly done by horse drawn wagons have been compiled. In the one matter of hauling coal, it has been estimated that with the truck the cost is 11.37 cents a ton-mile, while with horse drawn teams the cost was 18.79 cents.

NEW PACKARD TRUCK.



In order to round out its output of commercial vehicles, the Packard Motor Car Company, Detroit, recently placed a five-ton truck on the market. This is much like the three-ton Packard except that it has a more powerful motor and is of much heavier construction. The motor is rated at 40 horsepower, having a bore of five inches and a stroke of 5.5 inches.

KELLY COMPANY ENTERTAINS.

The Kelly Motor Truck Company, maker of Kelly vehicles, recently entertained nearly 30 fire chiefs and city government officials from various sections of Ohio, western Pennsylvania and West Virginia at its plant in Springfield, O. Trial runs and demonstrations of a new combination hose and chemical were witnessed.

Among those present were: Chief Lughler, Youngstown, O., president of the International Association of Fire Engineers; Chief Frank J. Connery, New Castle, Penn.; N. R. Hamilton, Youngstown, O.; C. A. Chambers and Chief Fred L. Martin, Chester, W. Va.; W. B. Martin, Steubenville, O.; Chief J. P. Hay, East Palestine, O.; E. W. Connelly, New Castle, Penn.; Chief Phillips, Wellsville, O.; Chief Roew, Wheeling, W. Va.; W. A. Lyon, C. J. Hubbard, H. Beck, S. J. French and Peter Hunter, Ravenna, O.; T. W. Dixon, New Castle, Penn.; Fred Peace, representing Gamewell alarm systems; Charles Ansley, Springfield, and A. L. Forschler, mechanician of the Kelly Motor Truck Company.

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

THE BLERIOT LIMOUSINE.

Those who are giving careful study to the science of aerial navigation must take cognizance of the steps by which the art of flying has progressed, and while many will be inclined to feel that the so-called Bleriot limousine shown herewith is a forecast rather than an accomplished fact, it nevertheless is true that this machine has flown successfully. More than that, several other aeroplanes, along this same general line have been constructed and flown abroad. In spite of this statement of fact, the practicability of a creation of this type is open to discussion, at the present stage of experimentation.

The machine in question was designed by Louis Bleriot, a pioneer in the construction of successful heavier-than-air types, at the request and under the guidance of Henri Deutsch de la Meurthe. The latter has been instrumental in encouraging all forms of use for the internal combustion motor and kindred industries. It was he who offered prizes early in the history of the automobile for the construction of models embodying certain ideas which he had evolved or in which he believed there was sufficient merit. He has played much the same part in the development of certain accessories, appliances and fittings for motor cars, notably the self-starter.

Officially, this monoplane is designated as a Bleriot type 24, although it has been termed an aerial limousine in this country, a flying berline in France and an aerocar in England. In general plan it does not differ materially from the regulation Bleriot monoplane, except that it has an elevator in front, worked in conjunction with the adjustable tail plane, and the construction throughout is heavier because of the additional weight it is designed to carry.

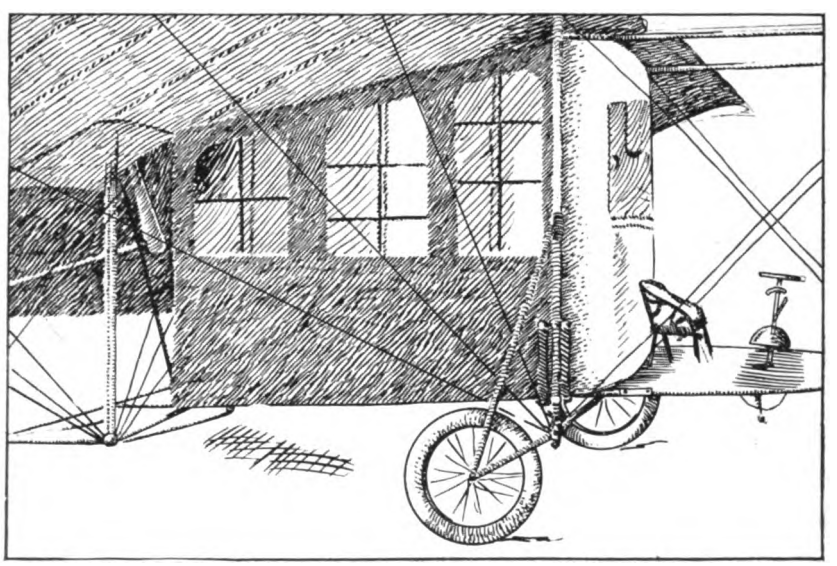
The greatest amount of interest attaches to the limousine body, which is the portion designed by M. Deutsch and was constructed by Rothschild & Sons, well known as a manufacturer of automobile bodies. It is a splendid example of the coachmaker's art.

This compartment is hung directly below the main plane and rests at the forward end on the regulation type of Bleriot landing chassis, equipped with liberal shock absorbing members. The material is three-ply wood of light weight, the entire structure weighing but 176 pounds. It is wholly enclosed, admission being by a door on either side, fitted with sliding windows. These windows, the two at either side of each door, and the two in front, are of non-inflammable celluloid, prepared by a special process, and are carried in wooden frames.

The interior presents a decidedly luxurious appearance. The seats are of wicker work, and together with the door panels, are fitted with air cushions. The ceiling and floor are covered with cork. Provision is made for four persons, seated vis-a-vis.

The pilot, or chauffeur as he is termed, is seated immediately in front of the limousine body, well below the main plane, and without protection, save for the small guy wires at either side. An extension of the limousine floor reaches slightly beyond the regulation Bleriot type of control, consisting of steering wheel and suitable levers.

The fuselage is of the usual girder type, and examination of the plan view discloses that that portion in front is only about half as wide as the rear portion. The latter tapers slightly toward the tail and extends to a point beyond the tail plane. Four tail booms carry the adjustable lifting tail, after the biplane practise and above these is the large vertical rudder.



The motor, a four-cylinder, 100 horsepower revolving Gnome, is at the rear and just above the roof of the limousine body, although it is in a direct line with the forward portion of the body and the leading edge of the main plane. Fuel is supplied by gravity from a stream line tank, placed in front of and slightly higher than the engine. The propeller is close coupled with the motor, and revolves behind the body, this portion of the design being that which has met with the chief objection on the part of those who have driven the machine. The location is such that the propeller must necessarily revolve in somewhat rarified air and the result is considerable loss of power.

Georges Legagnaux made the experimental tests

Digitized by Google

with this machine and succeeded in attaining a speed of 40 to 45 miles an hour. Considering the power of the motor, and the results which have been obtained with other types of Bleriot monoplanes, and machines of other makes, equipped with similar motors, this would seem to indicate that the placing of the propeller was at a decided disadvantage. The scant attention to the matter of reducing head resistance also had its effect in this regard, without doubt. Still, inasmuch as the machine was not designed for speed, perhaps this feature is not of so much moment after all.

As has been stated, the landing chassis is of the usual Bleriot type, although not of the very latest design. The most recent Bleriot monoplanes have been equipped with non-swivelling wheels, while those adopted for the limousine are more like those which first made their appearance on the Bleriot type 13. Of course, the whole carriage is much strengthened,

Sketch Indicating Suspension of Limousine Body and Location of Chauffeur's Seat and Control.

and the track, or tread, is eight feet, two inches instead of about six feet.

The rear skid also shows a marked difference from previous Bleriot design. With the majority of these monoplanes a single or double piece of bent cane is utilized to support the empennage, while with this machine the curved skid is equipped at the rear with a shock absorbing device.

Accompanying sketches show the dimensions of the various components, and indicate other details not touched upon herein. The entire assembly is interesting largely because of its novelty, and while other constructors have attempted to reproduce its main characteristics, this will always remain the pioneer enclosed passenger carrying aeroplane, designed and constructed along lines closely paralleling those of the present day automobile so far as they appear to be applicable to such machines.

K-R-I-T CAR PATHFINDER.

A K-R-I-T car, made by the K-R-I-T Motor Car Company, Detroit, Mich., was used to blaze the trail for the $100,000,000 highway, which it is proposed to build across the State of Pennsylvania. The official machine left Philadelphia, travelling through Lancaster, York, Gettysburg, Chambersburg, Everitt, Johnstown to Pittsburg and return. Those to make the trip besides the driver were the associate editor of the Philadelphia Press, and President Gans of the League of American Motorists. The trip was made without mishap, the car giving entire satisfaction.

RHOADS IS GENERAL MANAGER.

Benjamin A. Rhoads, superintendent of the Dayton Motor Car Company's plant, the Dayton, O., branch of the United States Motor Car Company, has been appointed general manager to succeed J. B. Myers, recently resigned to become the general superintendent of the Marion Motor Car Company of Indianapolis. Mr. Rhoads has been with the company for about 35 years, starting when it was engaged in the manufacture of agricultural implements. He was made master mechanic when the production of bicycles was begun, and superintendent when the factory was equipped for the manufacture of automobiles. He remained in the same position when the United States Motor Company took over the plant, and his recent promotion comes as a mark of approval for his many years of faithful service. Mr. Rhoads carries with him to his new position the well wishes of hundreds of employees, over whom he has had supervision for years and also those of many business friends he has gained throughout the industry.

DeLISSER WITH AJAX TIRE CONCERN.

Horace DeLisser recently resigned the vice presidency of the United States Motor Company, with headquarters in New York City, to become chairman of the board of directors of the Ajax-Grieb Rubber Company, Trenton, N. J., maker of Ajax tires. Mr. DeLisser had been with the United States Motor Company since its formation, leaving the tire business to join with Benjamin Briscoe in that enterprise. Much importance is attached to his return to the Ajax concern as it involves the establishment of a plant in Europe for the manufacture of Ajax tires. Mr. DeLisser will leave the latter part of July to make a study of the conditions abroad.

ELEMENTS OF MOTORCYCLE CONSTRUCTION.

Part XV---Outlining the Complete Overhaul of the Mount---Preparation of the Tool Equipment and Suggestions for Facilitating the Work.

(By C. P. Shattuck.)

NOT only will the operator find his road experience of value in overhauling the motorcycle, but the knowledge of the various components obtained by the disassembling and reassembling will be of decided service in remedying minor troubles. This holds true particularly of the proper adjustment and in tuning up the motor. The veteran rider usually overhauls his mount during the winter or early in the spring, but machines which have seen constant and severe usage may require a partial or complete renovation at other times, and the work may include the replacement of worn parts.

Broadly speaking, there is not much of this nature that is necessary about the modern motorcycle aside from a general cleaning and adjustment. There are, however, a large number of older mounts being utilized, and it is obvious that these will require a more complete renovation, the amount of work depending upon the design and condition. While it is admitted that experience is the best guide in the overhaul, there is much that may be performed by the novice who is familiar with the components of his mount. In attempting this work the amateur will do well to study each part during the disassembly, noting its function carefully. This will be of material aid in the reassembly.

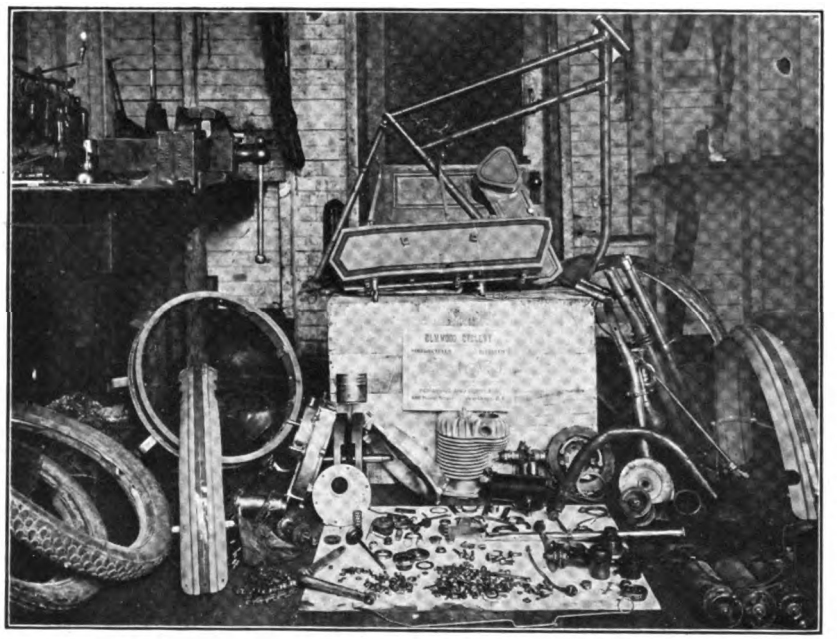

Fig. 86—Illustrating How a Motorcycle Appears When Completely Disassembled.—A Decidedly Unusual Photograph.

The suggestions contained herein do not apply to any particular make or condition, it being the object of the writer to treat the subject in a general manner. Although the cost of the overhaul by an expert is by no means prohibitive, there are many who desire to become better acquainted with their machines, and these are to be commended, as the knowledge acquired will be invaluable in event of serious trouble being encountered while on the road.

The novice should bear in mind that successful work cannot be performed with an ordinary wrench, a screw driver and a hammer. There are numerous small nuts and parts to be loosened and adjusted, many of which are so located as to be difficult of access, and if the workman be not equipped with proper tools the faces of the nuts will be injured. A nut that has been rounded through careless application of the wrench may occasion considerable trouble in replacing and tightening.

Unlike the motor car, the overhaul of the motorcycle does not necessitate the use of heavy tools, and the equipment for the latter should include a pair of combination pliers, a large and small screw driver, small and medium sized monkey wrench, ball pein hammer, adjustable S wrench, valve lifter, files, spoke tightener, can for gasoline and brush for cleaning. Some emery paper or cloth will be of service, also shellac and paper for gaskets, valve grinding compound, old cloth or waste, can of hand soap, lead or copper hammer, soldering outfit, etc. A large C clamp will be of value in disassembling the spring forks while a set of box wrenches having an universal joint attachment will be useful in removing bearings and other parts. While the list may appear formidable, many riders already possess the greater portion of these and such as are lacking may be borrowed from a fellow enthusiast. The C clamp may be secured from some carpenter and it is likely that he may also prove to be a motorcyclist.

Fig. 86 presents the mount completely disassembled, and it will be noted that there are numerous screws, nuts and bolts, which may become lost, if some

Digitized by Google

means are not provided to guard against this. Small wooden boxes or tins will serve for this purpose, and it may be added that it is well for the rider who is

Fig. 87—Outlining How Bearings Are Filed to Eliminate Play.—Note Manner of Utilizing File.

making his first overhaul to place the parts of each component in a separate box during the work of the disassembling. The expert can throw them all into a pile and pick out the nut or screw desired, but the amateur is apt to waste much valuable time in searching for the proper bolt. Then, again, he is liable to utilize a nut or screw which fits, but which did not come from the member being reassembled. By proceeding slowly and being systematic, the novice should be able with a little study of the mount to complete the task without difficulty.

Dismantling the Mount.

The first operation is to remove all accessories, including the horn, speedometer, acetylene light, gas tank or generator, pennant holder, luggage rack, etc. These members should be inspected carefully and if in need of repairs, attended to. Otherwise, they may be cleaned and put aside in a safe place.

As the power plant is one of the most important components of the motorcycle, it is advisable to take it from the frame and carry it to the bench for dismantling and cleaning. Before this can be done, however, it is necessary to disconnect all attachments and leads, and see that all dirt and grease has been removed, as foreign elements may get into the crankcase.

The gas and spark connections must be detached at the levers of the carburetor and magneto. If the machine be of the battery type, the leads at the breaker box must be disconnected. Next, shut off the gasoline and oil at the tank and displace the leads to the carburetor and crankcase, as well as those utilized with the hand pump.

Having made sure that all pipes and connections are free, the exhaust pipe should be detached from the motor and muffler. It is possible that the tubing may be "frozen" where it connects with the silencer, in which event the application of a little kerosene usually will start the member. If not, heat will have to be applied.

Belts and Chains.

The removal of the belt and chain should not prove a difficult matter, as the average rider is well experienced in the adjustment of these members. The leather belt should be cleaned and dressed, while the chains will require a thorough cleansing in gasoline or kerosene, after which they should be boiled in a preparation of tallow or beef fat in which is utilized a little powdered graphite.

If a free engine device is employed the controlling lever is detached. Before taking the cylinder or cylinders from the frame it may be easier to disconnect the wire or wires to the spark plugs and remove these members, noting at the same time that all other leads are disconnected. The valve caps, if mechanical members are fitted, are next displaced, after which the valve lifting tool is brought into operation. The valve spring is compressed and retaining key or pin is taken out, before the springs and valves may be removed. Unless one is familiar with the intake and exhaust members it is advisable to allow them to remain in the cylinders.

Removing Motor.

The engine is now ready for removal from the crankcase. Loosen retaining nuts, then rock the cylinder to start it from the crankcase. A screw driver may have to be inserted between the cylinder and casing to separate the members but undue force should not be employed. After the cylinder has been loosened, rotate the pulley or the sprocket by hand until the piston is at the bottom of its stroke, with the con-

Fig. 88—Depicting the Crankcase, Cylinder, Valves and Timing Mechanism of Battery Model.

necting rod lying against the lip of the crankcase at the opposite side to that on which the cylinder is to be removed.

Digitized by Google

Next slide the cylinder off very gently, being careful not to injure the piston or rings in the operation. Before removing the crankcase the old lubricant is

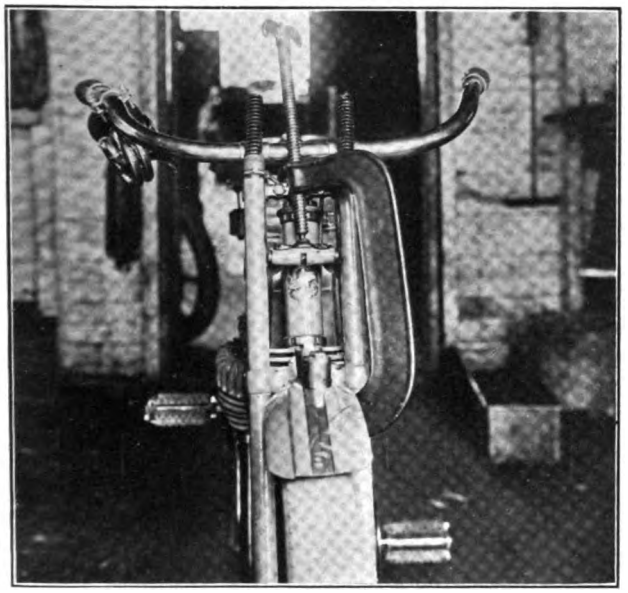

Fig. 89—A Large C Clamp Will Be Useful in Removing the Components of the Spring Forks.

drained out, and it may be flushed with kerosene, as this method will save considerable work in cleaning.

It is not imperative that the cylinder be detached from the crankcase. It may be taken out as a unit by disconnecting the bolts securing it to the frame. If the valve caps have become "frozen" the work of removing these members will be made more easy with the power plant in the frame. This, however, is optional with the workman.

Frame, Wheels, Etc.

If the overhaul includes enamelling the frame, mudguards, forks, tanks, etc., it is an excellent plan to dismantle these components and send them to the enamelling shop. Although similar preparations may be purchased, if the owner is discriminating, and takes a pride in the appearance of his machine, it is advisable to have the work done by the expert, as the result will be more satisfactory.

If the machine is to be refinished, the wheels must be removed, as will the tanks, mudguards, forks, handlebars, levers, crankhanger, etc. If the last named be of the spring design, such as depicted at Fig. 89, the novice is apt to experience considerable difficulty in disassembling the parts as he will be bothered in compressing the members sufficiently to permit of removing the connections. The kink outlined at Fig. 89 is employed by an expert repairman and is very simple. A C clamp, large enough to slip over the upper and lower portions, is necessary and by screwing down the threaded bolt the springs will be compressed, making the removal of the springs an easy matter.

In taking out the forks, the bearings will require loosening and in performing this work the uninitiated is liable to drop and lose some of the balls. However, the motorcyclist as a rule is a graduate from the ranks of bicycling and the experience acquired in the care of the latter will be of value when overhauling the mechanically propelled road vehicle. In connection with displacing of the bearings the boxes referred to in the early part of this discussion will be of service. As all ball bearings should be disassembled, and the balls, races and cones be cleaned and lubricated before replacing, it is an excellent plan to place each bearing in a separate box and mark it for identification.

There is little to be done to the clutch and transmission by the amateur other than to follow the instructions of the maker as to adjustment and lubrication. Some clutches are more easily pulled apart than assembled and if the member does not operate satisfactorily after complying with these instructions, it is best attended to by the expert who makes a specialty of the design. This may save considerable time and expense.

To complete a successful overhaul of the motor the bench should be equipped with a vise, as the tool will be invaluable when handling certain components. After removing the cylinders and crankcase to the bench the magneto should not be detached until the gearcase cover is removed and the pinions examined to note if they are marked. If not, these may be to make easy the replacement of the members.

Regarding the magneto, this member should not be tampered with, as there is nothing to be done except lubricate it in accordance with the instructions of the maker. If the device has been giving trouble it is best to ship it to the manufacturer, although cleaning certain parts is permissible and the operation will be outlined in proper sequence. If the mag-

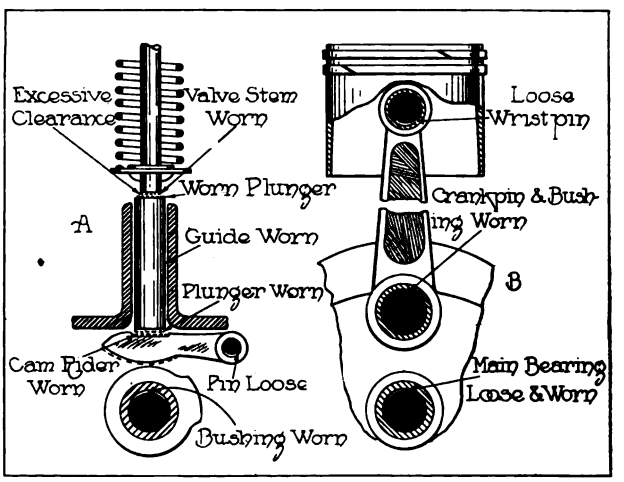

Fig. 90—Outlining Worn Parts Which Affect the Operation of the Power Plant: A, Showing Wear of the Valve Mechanism; B, Depicting Components Which May Be Responsible for Knocks in the Motor.

neto does not require any attention, it should be set away where it will not be injured.

(To Be Continued.)

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

The National Tours.

For the second time in the history of the Federation of American Motorcyclists, national tours to the convention took the place of the old national endurance run. Instead of two divisions, as was the case in connection with the Buffalo meet last year, there were four parties which made their way simultaneously toward the gathering in Columbus, O.

The tourists from the northeastern section of the country assembled in Albany, N. Y., under the leadership of Tourmaster F. S. Ellett, Elmira, N. Y. Previous to the actual start, July 13, the members of the Albany Motorcycle Club entertained the visitors at a smoker, and when the beginning of the trip was made, accompanied them as far as Schenectady, where it was decided to split the party into three sections, each in charge of a lieutenant.

Excellent roads were encountered as far as Fonda, when a sandy stretch of 15 miles caused some little unpleasantness. Fine macadam ways took the tourists through Utica to Syracuse, the night stop. Sunday found the riders in Buffalo, and Monday in Cleveland. Throughout the entire journey local motorcyclists did their utmost to make the stay in town a pleasant memory, and on several occasions lunch was served. Particular mention should be made of the dinner in Erie, Penn., where the 100 men sat down to tables waited upon by wives of Erie club members.

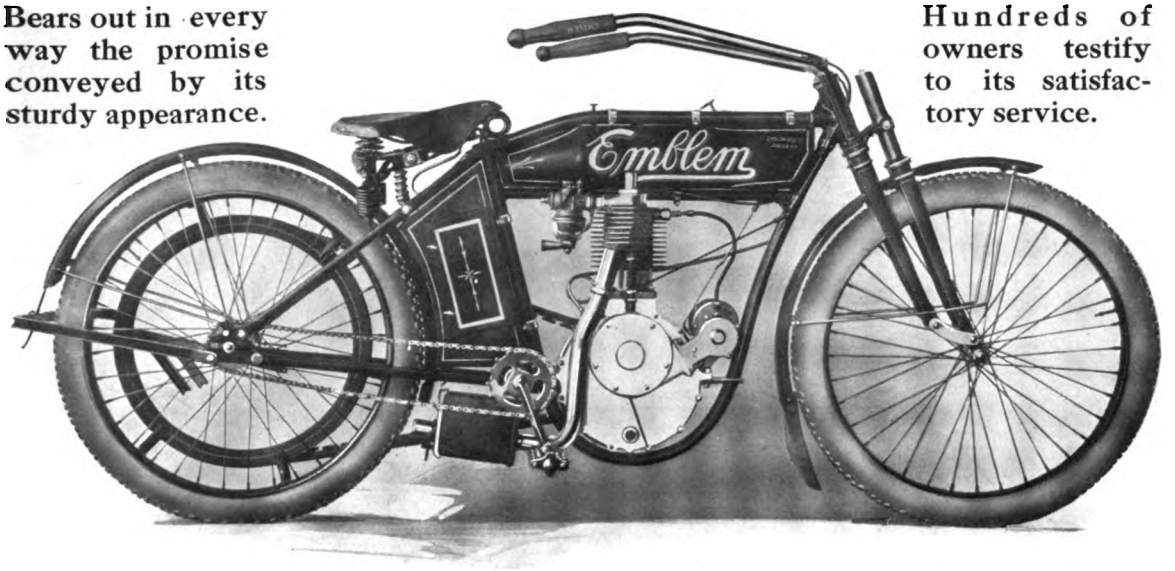
The southeastern division, from Baltimore, Md., was in charge of Howard French of that city. Seventy-five riders composed this party, which found many poor roads and much heavy mud, occasioned by recent storms. At Zanesville, O., the entire party was invited to make use of the Masonic Temple swimming pool, which had been placed at the disposal of the Zanesville club. Needless to say, the tourists were not slow in accepting the invitation.

The northwestern riders left Chicago in charge of J. A. Campbell of Toledo, O. There were about 120 machines in line at the start, but this number was increased materially in nearly every town of any importance through which the party passed. Several women accompanied their husbands, either on tandem seats or in sidecar attachments.

Louisville, Ky., was the rendezvous for the southwestern party, and the tourmaster was E. G. Baker of Indianapolis, Ind. Some 50 riders were in line in this division before it finally reached Columbus.

Members of the Providence Motorcycle Club at the Recent Annual Climb on Noose Neck Hill.

About 11:30 in the morning of Tuesday 385 machines rolled into Columbus, accompanied by members of the Columbus club, and the convention became an accomplished fact. Shortly after the arrival of the tourists, a heavy shower broke over the city and the mounts were drenched as they stood in line in front of convention headquarters. Careful count of the machines showed the following results as to makes:



Indian, 147; Harley-Davidson, 70; Excelsior, 38; Thor, 33; Yale, 29; Merkel, 24; Emblem, 11; Henderson, seven; New Era, five, Flanders, four;

EMBLEM CONSTRUCTION

Bears out in every way the promise conveyed by its sturdy appearance.

Hundreds of owners testify to its satisfactory service.

Write Dept. D for Catalogue and Descriptive Literature. Dealers, Ask for Agency Proposition.

THE EMBLEM MANUFACTURING COMPANY

Also Makers of the Famous Emblem Bicycles.

ANGOLA **ERIE COUNTY** **NEW YORK**

Minneapolis, Pope, Pierce, R-S and M-M, three each, and Wagner, two. It also is of interest to note that six per cent. of these were battery equipped and 94 per cent. utilized magnetos. According to the Bosch Magneto Company, 97 per cent. of the magneto models employed Bosch instruments.

Secretary-Treasurer's Report.

The report of Secretary-Treasurer G. B. Gibson at the annual convention of the Federation of American Motorcyclists in Columbus, O., indicates a splendid growth in membership during the past year. July 1, 1911, there were 9664 riders affiliated with the federation, while on the same day this year this had been increased to 16,250, a clear gain of 6586. A year ago there were 168 affiliated clubs, and this number has been increased to 291, a gain of 123. Repair shop registrations have jumped from 322 to 678, a gain of 356.

The treasurer's report shows the following summary:

Balance on hand July 1, 1911	$1,135.28
Receipts from all sources	16,265.80
Total	$17,401.08
Paid out during year as shown by vouchers	14,077.07
Balance on hand July 1, 1912	$3,324.01

Emblem at Toledo.

More than 5000 people witnessed the race meet at Toledo, O., under the auspices of the Interstate Racing Association, July 15, during which Taylor and his Emblem were in their old time form. The fastest 10 miles of the day was made by this combination, as shown by the following summary:

Five miles, open—First, Oberwegner, Excelsior; second, Flath, Pilot; third, Happ, Thor; time, 7:15.

Ten miles, stock—First, Taylor, Emblem; second, Willis, Indian; third, Birkenbach, Thor; time, 11:25.

Ten miles, handicap—First, Willis, Indian; second, Taylor, Emblem; third, Weitzman, Merkel; time, 12:32.

Five miles, open—First, Willis, Indian; second, Evans, Indian; third, Weitzman, Merkel; time, 6:17.

Five miles, stock—First, Evans, Indian; second, Happ, Thor; third, Long, Merkel; time, 4:18.

Fifteen minutes—First, Willis, Indian; second,

Club Notes, Here and There.

Riders in Middletown, O., have organized the Middletown Motorcycle Club, and plan to affiliate with the F. A. M. F. M. Wittlinger, 523 Yankee road, is the secretary.

The roads over which the Short Grass Motorcycle Club of Kansas will travel on its annual tour next month are reported to be in excellent condition by Wells Bennett, the pathfinder.

Members of the North Shore Motorcycle Club of Chicago recently completed a 24-hour endurance run between that city and Milwaukee.

One of the summer tours for the Minnesota State Automobile Association is being outlined and mapped by J. W. Whitehead of Minneapolis on a motorcycle.

One of the objects of the newly organized motorcycle club of Scranton, Penn., is to assist in the good roads movement.

The annual outing of the Maryland Motorcycle Club of Baltimore, Md., was recently held, a run being taken to a shore resort on the Potomac river, where an excellent dinner was served, followed by a programme of outdoor sports.

The Englewood Motorcycle Club of Chicago, Ill., held a moonlight picnic at Mauch Grove, Maywood, Ill., recently. The ride to Maywood, a distance of 18 miles from the headquarters of the club, was made by more than 200 members. Luncheon was served, followed by a musical programme and dancing.

The Atlanta Motorcycle Club of Atlanta, Ga., has a membership of 75. A run was made to Folsom's park, 16 miles from Atlanta, recently, where an old-fashioned Georgia barbecue was enjoyed.

The Yale Motorcycle Club has been formed in Toledo, O. The officers are: President, A. S. Weiler; secretary, J. W. Schroeder; messenger, Standly Ladd; road captain, S. J. Chubbuck.

The National Capitol Motorcycle Club of Washington, D. C., which claims the second largest membership of any of the clubs affiliated with the F. A. M., has started a campaign for members which it is hoped will result in the club's taking the lead before the end of the year.

Longest Tandem Tour.

The longest tour on a tandem to the F. A. M. meet in Columbus, O., was accomplished by Mr. and Mrs. E. H. Parker of Denver, Col., riding a Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O. Before starting on this trip the machine had covered a little over 3000 miles, and the journey to Columbus added 1961 miles more. A detour was made to visit the Merkel plant, during which the accompanying photograph was taken. Reading from left to right, the members of the party are: E. H. Parker; G. H. Snyder, Merkel agent at South Bend, Ind.; Elmer E. Smith, who holds the same position in Richmond, Ind.; Chief Engineer Joseph Merkel; John Merz, Indianapolis representative, and O. Weed, a well known Merkel racing rider of Bluffton, Ind.

Indians Win at Taunton.

Earl Gove of Brockton, Mass., riding an Indian machine, made by the Hendee Manufacturing Company, Springfield, Mass., was the winner of the five-mile race on the Taunton, Mass., fair grounds track at a recent meet under the auspices of the Taunton Gentlemen's Driving Club. Gove just succeeded in beating

Convention Tourists Stopping at Merkel Plant in Middletown, O., on Their Way to Columbus Meet.

out John Jarand of Providence, R. I., also riding an Indian. The race was the feature event of the afternoon. The riding was on a dirt .5-mile track, not

Digitized by Google

banked at the curves. Gove's best time for a mile was 1:20. In two previous shorter events, Jarand was the winner.

Herman Secures Most Members.

F. J. Herman of Pueblo, Col., was the winner of the solid gold F. A. M. pin offered to the member securing the greatest number of new applicants during the fiscal year of 1911-12, just closed. His record was 74.

Fitted with Bosch Magnetos.

According to an announcement by the Bosch Magneto Company, New York City, all of the motorcycles to finish in the Tourist Trophy races, just completed in England, were fitted with Bosch magnetos.

Motorcycles for Fire Wardens.

Motorcycles for use in patrolling long stretches of country in the national park regions of California were adopted recently. It has been found that the men can cover much more territory than they did formerly by horse, and the motor driven machines have been found more efficient in every way. The riders travel between 100 and 150 miles each day.

Triumph on the Market.

The Triumph Manufacturing Company, Detroit, organized last April for the production of Triumph motorcycles, has made such progress in the details of factory organization that the first machines were shipped recently. Two thousand motorcycles are now passing through the plant at 51-55 East Woodbridge street, in lots of 50 each and within a short time dealers all over the country will be receiving their first allotments. The company is turning out two types, a single-cylinder, one-speed model and one of two speeds. The first develops 5.5 horsepower and the latter 10. The officers of the company are: President, Robert M. Brownson; vice president, C. C. Wormer; secretary, Muir B. Duffield; treasurer, George W. Sherman.

Swenson on Long Trip.

Among the prominent New England motorcyclists who went over the road to attend the annual convention in Columbus, was B. A. Swenson, who was accompanied by Mrs. Swenson on an Indian mount, with a sidecar attachment, made by the Hendee Manufacturing Company, Springfield, Mass. The outward route was by way of Worcester, Springfield and Pittsfield, Mass.; Albany, Fonda, Syracuse, Rochester and Buffalo, N. Y.; Erie, Penn., and Cleveland, O. While in Buffalo a side trip to Niagara Falls was enjoyed. The return to Providence will be over an entirely different route, including New York City.

Win Old Sol Lamps.

The winners of Old Sol lamps, donated by the Hawthorne Manufacturing Company, Bridgeport, Conn., during the month of June were as follows: Indian Motorcycle Club, Mobile, Ala., two; East Side Motorcycle Club, East St. Louis, Ill., two; Austin Motorcycle Club, Chicago, Ill., one; West Texas Motorcycle Club, Stamford, Tex., one. In the contest covering a period of four months, ending June 30, and participated in by clubs affiliated with the F. A. M. previous to March 1, the winners were as follows: Topeka Motorcycle Club, Topeka, Kan., 56 new members, three lamps; Jacksonville Motorcycle Club, Jacksonville, Fla., 34 new members, two lamps; Cortland Motorcycle Club,

Howard Tromans of Rhode Island Motorcycle Club, With Majestic Sidecar and Harley-Davidson Mount.

Cortland, N. Y., 33 new members, one lamp; Lockport Motorcycle Club, Lockport, N. Y., 32 new members, one lamp; Maryland Motorcycle Club, Baltimore, Md., 30 new members, one lamp.

Policemen Learn to Ride.

Police Commissioner H. S. Amoit of Wyandotte, Mich., recently announced that every man in the department must learn to ride the motorcycle recently purchased. The machine was bought primarily to capture automobile speeders, but the officials believe it can be put to several other uses, and it is possible additional mounts will be bought.

Constant Wins Bosch Cup.

As a result of the racing in connection with the convention in Columbus, O., J. U. Constant of Brooklyn, N. Y., is the all around national amateur

Digitized by Google

champion of the Federation of American Motorcyclists and holds the Bosch trophy until the 1913 meet. The annual award of this cup, by the Bosch Magneto Company, New York City, makes it possible to determine a winner, since the prize goes to the rider securing the most points in the one, two, five and 10-mile, and one-hour events.

Two of these races were held previous to the convention, and as a result Constant had 12 points; Donald Klark, seven; Donald Johns, six, and Erwin Baker five. Constant won the one and 10-mile events and Klark the five-mile. This gave Constant 29 points and Klark 17. Both Constant and Klark ride Indians. Ray Seymour on an Indian won the national professional five-mile championship and Edward Hasha, also on an Indian, that for 10 miles.

Election of Officers.

The election of officers at the 10th annual convention of the Federation of American Motorcyclists in Columbus, O., July 17-21, resulted as follows: President, Dr. J. B. Patterson, Pratt, Kan.; secretary-treasurer, Dr. G. B. Gibson, Westboro, Mass. (re-elected); directors for three years, E. M. Estabrook, Bangor, Me. (re-elected), and William M. Johnson, owner of the Riverview track in Chicago. President Patterson has announced that he will reappoint Dr. J. P. Thornley of New York as chairman of the competition committee.

EAST JOINS AMPLEX FORCES.

Another announcement of a change in the personnel of the Olds Motor Works organization at Lansing, Mich., is made in that George L. East has resigned as director of advertising to take a similar position under President W. J. Mead of the Amplex Motor Car Company, Mishawaka, Ind., maker of Amplex cars. Mr. East has been with the Oldsmobile people some five years, during which time he has had general supervision of the advertising and publicity. He will be located at the Chicago offices of the Amplex concern.

BOILLOT USED MOBILOIL.

It appears that while American drivers were not successful in the recent Grand Prix race over the Dieppe course in France, American supplies were victorious. At least, the Vacuum Oil Company, Rochester, N. Y., is in receipt of the following cablegram from its Paris representative: "Boillot driving Peugeot car won Grand Prix, Dieppe, using Mobiloil." Naturally, the result of this test abroad is particularly gratifying to the Vacuum Oil Company, and should prove of interest to all American motorists.

ADOPTS WIRE WHEELS.

Decided interest in the matter of wire wheels has been created in America during the past few months, and it is not at all surprising to learn that at least one manufacturer has adopted this equipment for the 1913 season. Reference is had to the Dayton Motor Car Company, Dayton, O., a subsidiary of the United States Motor Company, and maker of the Stoddard-Dayton. It will be remembered that this concern was one of the first in America to utilize the Knight motor, and the wire wheels are to be fitted to the six-cylinder Knight model.

The 1913 line consists of the six-cylinder, built as a touring car, limousine and compartment roadster; the 48 horsepower with valve-in-the-head motor, and touring, limousine and compartment roadster bodies; the 38, with block motor and as touring car, compartment roadster, coupe, limousine and landaulet, and the 30 with block motor and as touring car and compartment roadster.

All limousine bodies are designed to seat seven passengers and embrace every feature and appointment that make for comfort and convenience. The roadsters, all of the compartment type, have a large enclosed space for luggage back of the driving seat. The new landaulet and coupe are typical of the Stoddard-Dayton's standard of coachwork, the former being designed as a seven-passenger car and the latter for three.

For the most part, no radical changes have been made. Minor mechanical refinements that have been dictated by service, have been incorporated, and there are numerous details which tend to simplify driving and promote comfort.

MERCER AGENCIES COMBINE.

The Whiting Motor Company of New York City recently acquired the Philadelphia branch of the Mercer Automobile Company, 620-622 North Broad street, which will hereafter be conducted as an agency of the Whiting company. The Philadelphia agency will have the territory including Pennsylvania, Delaware and Maryland in addition to the present territory of the Whiting Company of New York and New Jersey, excepting Mercer county, the home of the Mercer factory. The Whiting Motor Company's New York headquarters are at 1802 Broadway with a Newark branch at 486 Central avenue.

GRANT COMPANY MOVES.

The Grant Motor Car Company, Cleveland, O., moved into new factory buildings at 152nd street and St. Clair avenue, Collinwood, recently. The main building is 100 by 400 feet and the auxiliary structure is 60 by 160 feet. Both are of reinforced concrete. The new models made by the company will not bear the date of the year manufactured, but will be listed in series. Series No. 2 will be placed on the market Jan. 1, and each succeeding year another series will be added. The output of the company at present is 15 cars a day, but one model being manufactured. A six-cylinder roadster will be placed on the market the first of next year.

WITH THE MANUFACTURER.

C. Lawrence Wisehart, Elmira, N. Y., has assumed the management of the Resilio Company, 511 South Clinton street, Syracuse, N. Y., maker of a new tire filling product.

The Firestone Tire & Rubber Company, Akron, O., has opened a branch in Montreal, Can.

Charles D. Schmidt, with headquarters at 416 Broadway, has been appointed sales agent for New York City by the Baldwin Chain & Manufacturing Company.

R. J. Mackenzie, has joined the Kelley Motor Truck Company, Springfield, O., as purchasing agent.

The Webb Motor Fire Apparatus Company, St. Louis, Mo., it is reported, is to move to Allentown, Penn., in the fall. Mack truck interests are said to have stock in the company. During 1911 the firm made an even 100 pieces of fire apparatus. This year its business is reported as even larger. Milton A. Strauss, formerly with the Moon Motor Car Company, has been appointed sales manager for the Webb concern.

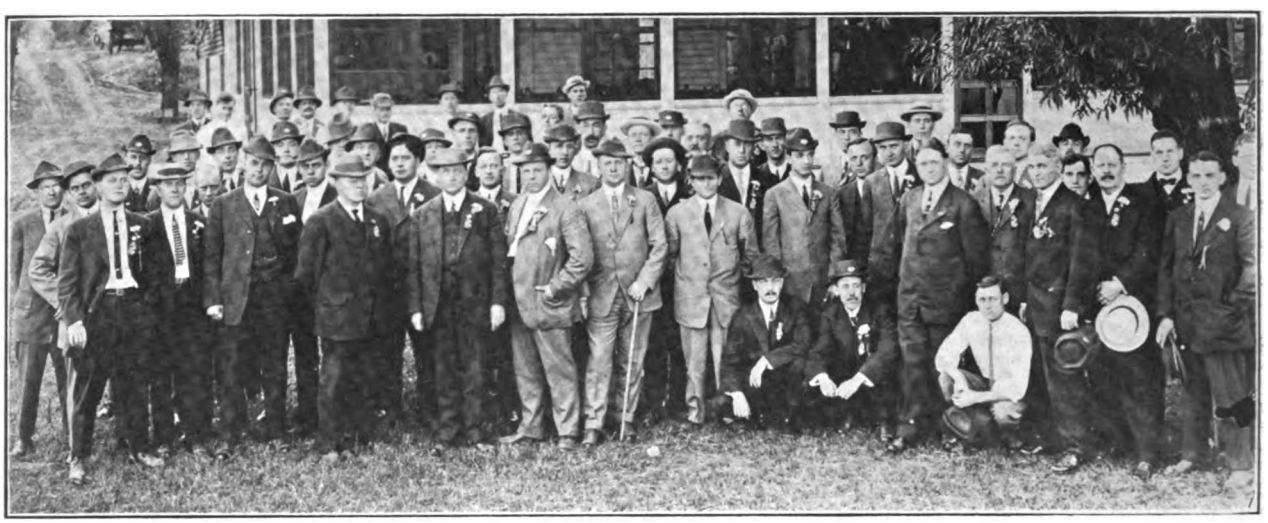
The R-C-H Corporation, Detroit, Mich, recently opened a branch and service station in San Francisco, Cal. A. E. Morrison, western sales manager, made the arrangements for the opening, the step being necessary in order to care for the increasing trade on the Pacific Coast. The building secured is a three-story structure, in the heart of San Francisco's automobile district, and provides 18,000 feet of floor space. The corporation now has stations and factory branches in Detroit, Chicago, New York, Boston, Philadelphia, Atlanta, Buffalo, Cleveland, Kansas City, Minneapolis, Denver, Los Angeles and Walkerville, Can.

The Penn Motor Car Company, formerly located in Pittsburg, Penn., now occupies its new factory buildings in New Castle, Penn., covering more than five acres. The main structure is 510 by 60 feet, and is used for the chassis assembling and chassis painting. Running back from this building are six wings, each 60 by 150 feet, which are to be used for the machine shop, upholstering and top departments, testing and repairs, stock rooms and final assembling. The entire building is of steel, concrete and glass. There is excellent light and ventilation, and one admirable feature is that there is not a post in the entire structure. Situated so that it can easily ship by four different trunk lines, the railroad facilities are excellent. The company makes pleasure cars and a light delivery motor car.

Harry E. Freeman, for 12 years connected with the advertising department of a prominent Cleveland newspaper, was recently appointed sales and advertising manager of the Sewell Cushion Wheel Company, Detroit.

D. E. Keith, manager of the Indianapolis branch of the Ford Motor Company, is makng a six weeks' tour over Indiana in a Ford car. He is visiting all of the 65 agents in the state, and making a thorough investigation of the automobile prospects in Indiana for 1913.

The G. & T. Tire Company has purchased a tract of ground, 170 by 220 feet, in Indianapolis, Ind., on which it will erect a five-story building of reinforced concrete to cost approximately $100,000.



The Dorris Motor Car Company's new factory, St. Louis, Mo., is rapidly nearing completion. The new building will mean practically a doubled capacity for the Dorris company. The structure is fireproof and three stories in height.

The Timken-Detroit Axle Company is having two large additions built to its plant in Detroit. The firm denies the report that it has purchased land in Toledo, O., and that a plant is to be erected there.

The Cartercar Company, Pontiac, Mich., has just closed a contract giving the MacEwen-Webster Auto Company of Swift Current, Sask., the agency for Saskatchewan, Alberta and Manitoba.

The Todd Manufacturing Company is to open a factory at 820 Mary place, Minneapolis, Minn., for the purpose of making radiators, hoods, fenders, drip pans, tanks and other sheet metal specialties for automobiles. The parties representing the firm are Frank Todd, formerly superintendent of the Long Manufacturing Company of Chicago and Detroit; B. A. Wolfe and Morgan C. Wood.

Arthur I. Philp has become associated with the Studebaker Corporation, Detroit, as assistant sales manager of the automobile division. He was until recently district manager for the United States Tire Company, and prior to that was with Morgan & Wright. In the old bicycle days he sold Imperial wheels for Ames & Frost.

District Managers of the Willys-Overland Company at Their Recent Annual Convention in Toledo, O.

The Willys-Overland Company recently held its annual district managers' convention at Toledo. The session was of three days' duration, the time devoted to business and to pleasure being almost equally divided. While the men assembled were busy enjoying the various entertainments and banquets they were also laying vigorous plans for 1913. Business meetings were held at the plant of the company each morning and afternoon, while the evenings were spent at the theatre or about the table. A power boat ride and banquet at the Toledo Yacht Club headquarters brought the convention to a close.

GARAGE AND DEALER.

The Standard Motor Car Company, which covers the Pacific Coast and operates distributing agencies in San Francisco, Oakland and Los Angeles, for the sales of Stoddard-Dayton cars, made by the Dayton Motor Car Company, Dayton, O., is to give a two weeks' vacation in the East to the salesman who makes the best record between May 1 and July 31. The Stoddard-Dayton factory and other plants of the United States Motor Company will be included in the itinerary.

H. W. Evans, who has been connected with the San Francisco branch of the Locomobile Company of America of Bridgeport, Conn., for the past two years, has

Digitized by Google

been put in charge of the truck business of the company on the Pacific Coast. George A. Crane has been secured by the Locomobile company to take charge of the truck business in the territory controlled by the Chicago branch. Before joining the Locomobile forces, Mr. Crane was connected with the Knox Automobile Company and the United States Motor Company.

The American Locomotive Company, New York City and Providence, R. I., recently announced the following new dealers added to its list: H. T. Rogers, Binghamton, N. Y.; Six Thirty-eight Tire & Vulcanizing Company, Memphis. Tenn.; W. H. Ash, Peekskill, N. Y.; George E. Stocking, Rochelle, Ill.; Geddes & Sheffield, Calgary, Atla., Can.; Taylor & Musson, Edmonton, Alta, Can.

J. J. Cole, president of the Cole Motor Car Company, Indianapolis, Ind., accompanied by General Sales Manager Charles P. Henderson and William L. Colt, the latter of the Colt-Stratton Company, New York City, eastern distributor for Cole cars, have been making a tour of the agencies in the East. The first stop was in Pittsburg, from which city they went to Washington, Baltimore, Philadelphia and Newark, to New York, where a banquet was held, at which representatives of the metropolitan press were the guests of honor. A similar gathering was held in Boston.

G. A. Besosa of San Juan has taken the agency for the Marmon cars, made by the Nordyke & Marmon Company, Indianapolis, Ind. G. L. Omohundro of Little Rock, Ark., is also a new Marmon dealer.

The Henderson Motor Car Company recently awarded contracts to the following agencies: W. A. McKnight, Alexis, Ill. Johnson Motor Car Company, Philadelphia, Penn.; Service Motor Sales Company, Newark, N. J.; James A. Binney, Boston, Mass.; Atlanta Auto Sales Company, Inc., Atlanta, Ga.: Mattoon Refrigerating Company, Mattoon, Ill.; Bonnheim-Moore Motor Car Company, San Francisco, Cal.; the Blackhawk Auto Company, Waterloo, Ia.; A. C. Schafer, Grundy Centre, Ia.; Model Auto Sales Company, St. Louis, Mo.; Matheson Motor Company, Washington, D. C.; J. W. Wilcox, Los Angeles, Cal.; Whittlesey Garage & Machine Company, San Bonito, Tex.; J. J. Deskin, Missouri, Ia.

H. W. Yeager, president of the Yeager Piano Company, Hartford, Conn., has taken the agency for the complete line of Velie pleasure and commercial cars, made by the Velie Motor Vehicle Company, Moline, Ill. His territory will include Hartford and vicinity.

H. F. Sundin has become the distributor for the National car, made by the National Motor Vehicle Company, Indianapolis, for Kansas City and vicinity. He was formerly a travelling representative of the National company.

E. E. Guthrie and Henry Winn of the Kansas branch of the R-C-H Corporation, Detroit, have returned to their duties after spending a week at the factory.

The R-C-H Corporation, Detroit, recently signed 1913 contracts with the following: The Smith Motor Car Company, Hazleton, Penn.; Shaffer Manufacturing Company, Baltimore, Md.; W. L. Reisinger, Newport, Penn.; Model Garage, Lynchburg, Va.; Yale Motor Company, Camden, N. J.; Peters & Kittell, Hornell, N. Y.; Willard Morris, Dansville, N. Y.; F. E. Wickwire, Elmira, N. Y.; Slawson & Lounsbury, Jamestown, N. Y.; Cook Brothers, Castle, N. Y.; Muncie Motor Company, Pasadena, Cal.; William H. Hedges, Southampton, N. Y.; I. A. Silvie, Jr., Port Richmond, N. Y.; the Central Motor Car Company, New York City; James N. Bussey, Troy, N. Y.; Walter J. Connelly, Hartford, Conn.; Central Garage Company, New Canaan, Conn.; O. W. Smith, New Philadelphia, O.; Vincent & Hurd, Hiram, O.; Old-Oakland Motor Company, Cincinnati, O.; Drayton Auto Company, Drayton, N. D.; White Bear Auto Company, St. Paul, Minn.; Olson-Hemming Auto Company, Morris, Minn.; Dalley Motor Company, Washington, N. C.; W. T. Hearne, Whitakers, N. C.; Capitol Motor Car Company, Raleigh, N. C.; W. A. Blackburn & Co., Goldsboro, N. C.; Worley & Terrey, Viola, Ill.; E. L. Warneke, Sterling, Ill.; J. H. Reichardt & Co., Cornell, Ill.; C. C. Hinckley, Aurora, Ill.; Victor F. Michelson, Chicago, Ill.; H. Ohlendorf, Freeport, Ill.; Sears Automobile Company, Des Moines, Ia.; John M. Knapp, Rensselaer, Ind.; Niles Center Garage Company, Niles Center, Ill.; A. A. Marvin, Son & Co., Maple Park, Ill.; Heckbarth & Schering, Palatine, Ill.; B. E. Graham & Co., Mount Pleasant, Mich.; G. A. Webber, Jackson, Mich.; Worthrup & Clark, Houston, Tex.; Cole Bros., Malta Bend, Mo.; C. E. Bobo, Paxton, Ill.; E. E. Whipple, Providence, R. I.; Warden Hardware Company, Geneva, O.; L. F. Portz, Loudonvile, O.; Carr Bros., Scio, O.; Harry E. Heckert, Springfield, Mo.; Charles Murray, Colby, Kan.; W. H. Sherrick & Co., Centerview, Me.; G. D. Prentice, Great Falls, Mont.; J. J. Schutz, St. James, Minn.

The Indiana Garage & Sales Company, located at 3316 East 15th street, Kansas City, Mo., has closed a contract with the Lincoln Motor Car Works, Chicago, whereby it wil become distributing agent in Kansas City for the Lincoln light delivery wagons. The first shipment of cars has been received.

The Everitt Auto Sales Company, recently incorporated for $30,000 under the laws of Ohio, has opened a salesroom for the distribution of Everitt cars, made by the Everitt Motor Car Company, Detroit, formerly the Metzger Motor Car Company, throughout the State of Ohio. The officers of the company are: President, H. K. Dobson; vice president, Elmer E. McConaha; secretary and treasurer, A. F. White.

The Baldwin Smith Motor Truck Company, 115 East Second stret, Wichita, Kan., has been organized for the purpose of handling commercial motor vehicles in Wichita and vicinity. The company recently closed a contract with the Lincoln Motor Car Works, Chicago, Ill., becoming distributing agent for the Lincoln light delivery wagon.

Fred Campbell, proprietor of an accessory house in St. Louis, Mo., has been elected president of the Motor Accessories Association of that city.

L. L. Law, manager of the Jackson Motor Parts Company, Toledo, O., will be distributing agent for the Jackson car, made by the Jackson Automobile Company, Jackson, Mich., in northwestern Ohio, southern Michigan and eastern Indiana.

The Speedwell Motor Car Company, Dayton, O., has taken over the San Francisco agency and has made it a branch. H. Harry Croninger will be the manager.

The United International Motors, Ltd., the foreign affiliation of the United States Motor Company, recently took new quarters at 212-14 Portland street, London, Eng.

The Meridan Automobile Company, Indianapolis, Ind., has sold its property and business at 724-730 North Meridan street, to the Waverley Company, which will use the property as a factory sales branch and garage for electric cars. It will be under the management of Henry C. Churchman.

O. E. Stoll is in charge of the new branch and service station recently opened in St. Louis, Mo., by the General Motors Truck Company.

The Rhineland Machine Works Company has opened an office and store at 1254 Michigan avenue, Chicago, Ill., which it will occupy with the American Electric Manufacturing Company.

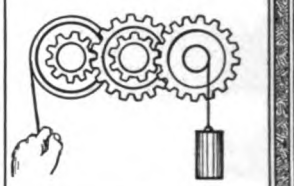
The Oakland Motor Car Company is having a $50,000 salesroom, garage and repair shop erected in Atlanta, Ga.

The Locomobile Company of America, Bridgeport, Conn., has contracted for the erection of a $40,000 garage and showroom at Atlanta, Ga.

The G. E. & H. J. Habich Company, New England distributor for the Cole automobile, made by the Cole Motor Car Company, Indianapolis, Ind., recently moved into new quarters on Bickerstaff street, Boston. The building is one of the best appointed service stations in the East.

City Garage & Sales Company, is the title of a concern which will enter the garage business in San Diego, Cal., as soon as quarters can be completed. A building is being constructed at Cedar and Cordova streets.

M. Nabors and R. M. Northcutt are among the latest additions to the automobile industry in Atlanta, Ga., where they have formed a partnership and secured the agency for the Cole and Alco pleasure cars and the Alco and Federal trucks. The firm will occupy salesrooms at 239 Peach street.



Davis B. Roberts, manager of the Buick Garage in Hartford, Conn., which was partly destroyed by fire recently, announces that the building is to be replaced at once.

L. R. Pingrey and C. A. Waite, formerly partners in the West Liberty Auto Company, West Liberty, Ia., have dissolved business relations, and Pingrey will conduct the garage formerly operated jointly.

The Corona Machine & Auto Works is the name of a new repair concern which recently started business in Corona, Cal. The officers and stockholders are: President, John H. Phillips; vice president, R. L. Willits; secretary and treasurer, Edward I. Barnes.

RECENT MOTOR VEHICLE PATENTS

Dow Ignition System.

Willard A. Dow, Braintree, Mass., has patented an ignition system for internal combustion engines. It is very compact, comprising as it does, magneto and battery circuits, also an induction coil and switch. Provision is made for attaching the various primary, secondary and ground wires and for cutting in the coil or magneto circuits as desired. Being in cartridge form it is installed easily on the dash of an automobile.

Swearingen Muffler.

The prohibiting of the use of cut-outs on mufflers has stimulated the efforts of inventors to produce a muffler which will not only reduce the noise of the exhaust to a minimum but back pressure as well. Zachariah Swearingen, Oscealo, Ia., has been granted a patent for a silencer which is fitted with removable heads, the latter being provided with suitable openings for the admission and egress of the burnt gases. The interior of the device is equipped with a deflector of concavo-convex design, also conical and other similar member. The components are held together by means of tierods and it is claimed by the inventor that the muffler may be disassembled and cleaned easily.

Pennock Horn.

Willard Pennock, Minerva, O., has been granted a patent for a motor car horn operated by the exhaust from the engine. The three tubes are similar in construction to the usual tube horn but the passages for the gases are slotted and means are provided for registering these spaces, as well as for directing the flow of the exhaust through the signal and for interrupting the same.

Roberts Self-Starter.

A large number of patents has been granted of late for self-starting devices for automobiles. Judson O. Roberts, Cripple Creek, Col., has patented a mechanical starter for gas engines, which comprises a reciprocating starter shaft, a coupling adapted to engage said shaft with that of the motor, also a coil spring centred around the starter shaft. The spring is supported by a pair of wheels having guide engagements, a number of pawls and a dog controlling their movements. An auxiliary spring is provided to maintain the connecting coupling from engagement when the device is not in service. Pivotally connected to the starting mechanism is a lever in turn secured to a rod which is actuated by a lever conveniently placed to the driver or operator. Means are also provided for rewinding the spring by the power of the motor.

Thomson Pivot Lamp Device.

Among the latest devices for mounting the headlights of the motor car so that the members will be turned simultaneously with the front wheels, is the the invention of Arthur Gale Thomson, San Francisco, Cal., to whom a patent has been granted. The rotating means are obtained by mounting the lamps on a turntable device and the lights are operated together by means of a connecting tierod, which actuates the bell cranks secured to each lamp. Motion is imparted to the device by the steering mechanism which operates a series of pivotally mounted levers.

Hart Automobile Jack.

Charles A. Hart, Findlay, O., has been granted a patent for a novel form of automobile jack by means of which a motor car may be run onto the member and jacked up by a tilting movement. The jack comprises a tiltable frame, including standards, the latter being provided with base fulcrum members. Each standard has on its underside main and auxiliary bearing surfaces extending at an angle to one another to support the frame in a tilted or vertical position. Runners are fitted, these being for the purpose of receiving the wheels of the vehicle and pivotal means also are provided.

OTHER PATENTS GONE TO ISSUE.

Spring Wheel, Alvin R. McEntire, Folsom, Ga. A vehicle wheel comprising a hub, a number of spokes slidingly mounted and coil springs arranged between the hub casing and retaining nuts.

Lathe Attachment, John M. Palmer, Chicago, assignor to the Universal Tool Company of that city. A lathe attachment, a turret head for carrying a plurality of lathe tools, and a substantially concentric shank extending therefrom, said head and shank having a tool receiving socket therein.

Carburetor, Nathaniel C. Stamps, Ocean Park, Cal. A carburetor having the usual mixing chamber and outer air passages but provided with a movable thimble device having a central air passage and means for controlling the air passing through the inner and outer passages.

Clutch Mechanism, Frank B. Allen, Salt Lake City, Utah. A clutch mechanism including in combination a transmission ring, a split gripping ring located within the same, a hub, sleeve and means for forcing the gripping ring into contact with the transmission and operating toggle levers.

Motive Fluid Mixer, William G. Cross, Seneca Falls, N. Y. A motive fluid mixer for internal combustion engines having a transfer passage for the fluid to be mixed with gas to provide a charge of motive fluid to the motor.

Roller Bearing, Chester Arthur Heinzelman, Belleville,

Digitized by Google

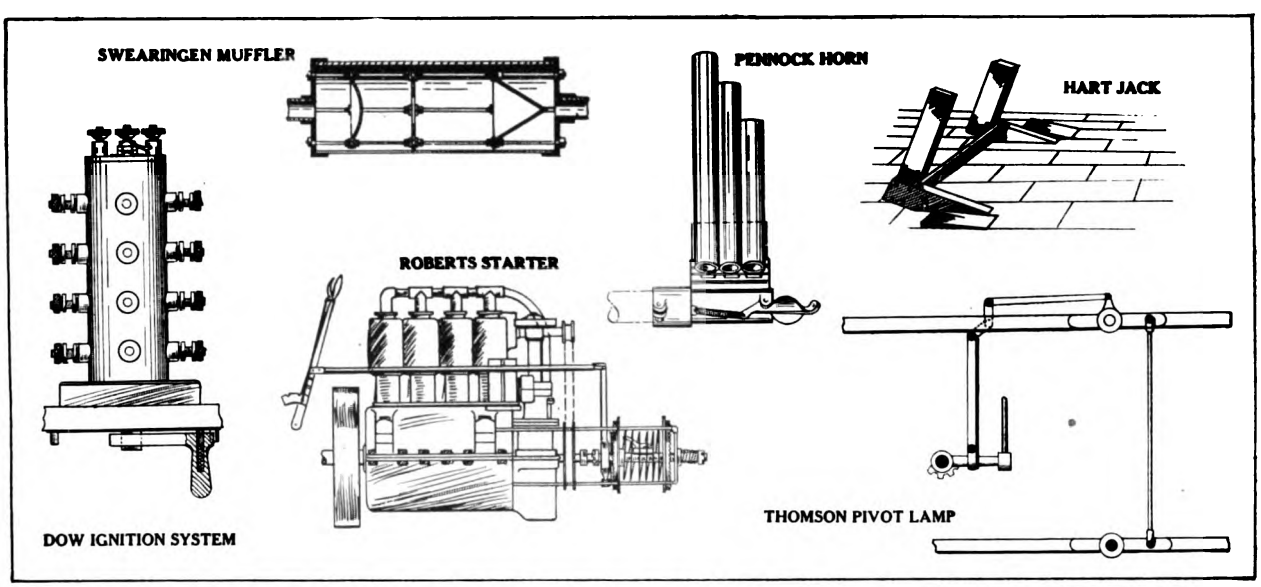
111. A roller bearing comprising an inner member mounted on the spindle of the bearing and provided at one end with an undercut recess; a beveled surface which tapers oppositely to the sides of said recess, and a roller retaining ring fitted with yielding fingers which have lugs that project into said undercut recess.

Lock Nut, George O. Douthit, Summers, Ark., assignor to M. M. McCoy, Westville, Okla. The recessed or threaded portion of the nut is provided with teeth which grip the bolt and the device is secured by means of a locking pawl.

Sash Lock and Anti-Rattler, Joseph De Mars, San Francisco, Cal., assignor in part to Frank Minitree Johnson, Cheyenne, Wyo.; Anthony J. Walker, Niagara Falls, N. Y., and Arthur J. De Mars, San Francisco. A sash lock having a flanged casing with rock shaft journaled in the flanges, bent into two loops and provided with a stop projection adapted to engage the back of casing, and two flat spring indents. The free ends of the springs project in opposite directions and engage the edge of the sash.

Spark Plug, Joseph J. Lombardi, New York City. An electric ignition device comprising a hollow base portion and an insulating block fitted therein through which extends the electrode. The lower part of the shell has a circular opening and means are provided for raising or lowering the electrode to obtain the desired gap.

ated, providing for different positions of the shield.



Wrench, Thomas J. Kennel, Middletown, O. A wrench having serrated jaws, also those of the usual construction. Means are provided for adjusting either set.

Spring Wheel, Robert Stock, Silver Creek, N. Y. A spring wheel having hollow spokes connecting the hub and rim, and main guide rods passing through openings in the rim and their inner ends within the spokes. Coiled springs are fitted inside the hollow spokes and auxiliary guide rods are incorporated between the ends of the springs and the outer rim. Other coiled springs are provided between the outer and inner rims.

Multi-Cylinder Engine, Samuel James McFarren, Pittsburg, Penn. A four-cycle gas engine having an uneven number of cylinders in two parallel groups, a shaft having oppositly set cranks, each of two said groups of cylinders being above a horizontal plane passed through the axis of said shaft. The pistons of the cylinders of one group are connected with one crank while those of the other group are attached to another shaft.

Spray Carburetor, Gottfried Plumm, Berlin, Germany. A carburetor having a revolving conical top with mixing mechanism and a porous nozzle pipe.

Expansible Piston, Edmond Van Bever, Watertown, Mass. A hollow shell piston, hvaing inwardly extending bosses with wristpin fitted therein, and a shell portion integral with the piston body extending inwardly from

Depicting Some of the Recent Ideas of Inventors Relative to Devices Applicable to the Motor Car and Its Allied Industries.

Vehicle Tire, Lewis Quintal, Cleveland, O. The device comprises two rims between which are interposed coiled springs resting in cup shaped members and means are provided for their retention and operation by adjustable bolts.

Lubricator, Ivert Larsen, Chicago. A lubricating device comprising a reservoir having a number of outlets, a rotary member for registering said outlets and a pump having a valve equipped piston for actuating the lubricant.

Spring Wheel, Herman M. Strawn, Marysville, Cal. A spring vehicle wheel having outer and inner rim members between which are fitted semi-circular springs which are retained by a device secured to the inner rim.

Motorcycle Handle, William F. Boast, Sterling, Col. A handle comprising a hollow grip of resilient material, having a coiled spring imbedded therein, and a block located in the outer end and engaging the springs.

Resilient Tire, Oscar H. Duckworth, Summerfield, Kan. A tire having a coiled spring formed into a series of convolutions and means for retaining spring and to provide for contraction and expansion.

Windshield, George F. Murphy, New Haven, Conn. A windshield for motor car service having curved forward members upon which the member is attached and oper-

said wristpin, said integral shell portion having a lengthwise extending slot and an external expander designed to expand inwardly extending shell portion.

Tire Tool, John H. Blake, Portland, Ore. A device for removing tires from rims, comprising a lever having teeth, a hook like lever carrying a pawl for engaging with said teeth and means for actuating same.

BAKER EXTENSION BROUGHAM.

The latest model announced by the Baker Motor Vehicle Company, Cleveland, O., maker of the Baker electric, is an extension brougham of the type which enables all the passengers to face forward. The new car is being produced as a result of the demand for the five-passenger facing forward model "Y" extension brougham, introduced a short time ago, and while its dimensions are slightly smaller and it has a shorter wheelbase, it has the same general lines and equally luxurious appointments.

K-D MOTOR COMPANY FORMED.

The K-D Motor Company (Knight-Davidson Motor Company) was recently incorporated for $100,000, for the purpose of manufacturing the K-D motor, the invention of Miss Margaret E. Knight of South Framingham, Mass. The incorporators are Margaret E. Knight, Anna F. Davidson and Beatrice M. Davidson. It is intended to have the principal office of the concern in New York City. Nothing has been done except to file the certificate of incorporation and hold a stockholders' meeting. It is proposed, however, in the near future to open an office in New York City and to vigorously prosecute the business.

NEW WHITE POLICY.

The White Company, Cleveland, O., maker of White pleasure and commercial cars, announces that it has given up entirely the idea of bringing out new models at a certain specified time each year. In accordance with this policy, in the future White cars will be known by their model letters, without reference to date, and a model will continue, irrespective of the year, until it is found advisable to change it. At that time the current model designation will be dropped, and a new one will be substituted. Any change in design or construction that is found desirable will be made as soon as it is apparent that such will be a real improvement, instead of waiting to announce it at the end of the season. For these reasons there will be no 1913 announcement of White cars.

Princess Victoria, the 25.5-Inch Midget, Her Giant Footman and Her Special Cole Coupe-Roadster.

SALESMEN AND ADVERTISING.

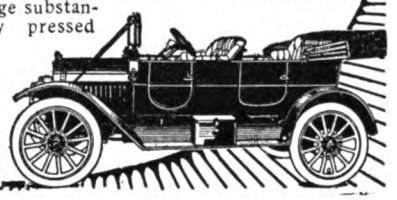
The automobile industry is giving more and more attention to the subject of salesmanship. Those who have studied the matter closely are convinced that advertising is closely allied with the salesman. The particular merits of each were set forth in a most interesting manner in an address recently given by Franklin P. Shumway, of the Franklin P. Shumway Company, an advertising agency, located at 373 Washington street, Boston, before a body of selling agents, etc., in New York City. In this advertising was described as the silent salesman, which if rightly employed, costs the manufacturer, jobber and retailer nothing, and saves money for the consumer. Several examples were cited in which it was set forth that proper advertising had so increased the income that the net profit was sufficient to wipe out the cost of the advertising. The address has been reprinted in booklet form and is being distributed to those who are interested.

A SPECIAL COLE ROADSTER.

It is not uncommon for motor car manufacturers to be called upon to change certain portions of the machine to fit the person who is to operate it. This usually applies to the pedals and other similar details, but an accompanying illustration presents a piece of work which went much further in this respect. The car is a special coupe-roadster, made by the Cole Motor Car Company, Indianapolis, Ind., for Princess Victoria, a 25.5-inch midget weighing 19.75 pounds.

It is a regular stock Cole chassis, the only deviation being in the coupe body. This is mounted in the rear of the roadster seats, the gasoline tank having been removed and located under the rear end of the special body. Provision also is made for the giant liveried footman, who accompanies the midget on her travels about the country.

The interior of the coupe is attractively decorated with red satin, and contains every comfort for the diminutive princess, and as may be noted, is entered by a short flight of steps. The entire assembly has occasioned not a little favorable comment, and the Cole company has been the recipient of many congratulatory messages with reference to its neat appearance. In every way the Cole company has demonstrated that it is fully able to undertake any type of special design.



HUNDREDS, NOT THOUSANDS.

In connection with the mechanical description of the Keeton car, made by the Keeton Motor Company, Detroit, in the June 25 issue of The Automobile Journal, mention was made that the company expected to place 15,000 cars in the market this year. This should have read 1500.

STUTZ $2000 CAR DEFEATED THE HIGHEST PRICED CARS MADE AT HOME OR ABROAD.

"The Car that made good in a day".

At the Indianapolis Speedway, Decoration Day, the Stutz had three entries. It was one of the smallest cars in the Five Hundred Mile Race. Merz, who finished fourth, averaged more than seventy-six miles an hour for the full 500 miles. Len Zengel averaged seventy-three miles an hour and won sixth place in a Stutz. Gil Anderson averaged over 80.88 miles an hour for 200 miles, when he went off the track on account of a blown tire.

Lighting Dynamo

For Automobiles and Motor Boats

¶ A variable speed dynamo for variable speed engines.

¶ High efficiency, slow speed and regulated output secured by properly proportioning the elements that make up any dynamo and without extra parts.

¶ All material is fully active at the slower speeds, and the wiring is of the simplest form, merely two wires from dynamo to battery, and thence to lighting circuits. Wires are connected regardless of polarity.

BUY YOUR LIGHTING DYNAMO FROM A FIRM THAT HAS SPECIALIZED ON SMALL DYNAMOS AND MOTORS FOR YEARS.

The Unquestioned Accuracy of the

JONES Speedometer

Has enabled it to lead the entire Speedometer industry, since Mr. J. W. Jones built the first speedometer—twelve years ago. The imitators have followed in appearance and style but real accuracy is beyond them for the reason that the Jones is constructed on the unalterable principle of Centrifugal Force—not Magnetism.

Let Yours Be A Jones

A large variety of individual models and clock combinations. Prices to meet the lowest as well as the highest priced cars. Ask your dealer for the Jones—don't accept inaccurate imitations.

CAREFUL DRIVERS USING SO-CALLED GUARANTEED MILEAGE TIRES HELP TO PAY FOR TIRES ABUSED BY RECKLESS DRIVING

Why Pay For Tires Abused By Others?

Did you ever stop to think, Mr. User of Mileage Guaranteed Tires, that while you are following out the letter and spirit of your agreement by careful driving, proper inflation, and no overloading, there are scores of drivers paying no attention to these details. Factory perfect

FRONTIER TIRES

are guaranteed absolutely against mechanical imperfections and to afford reasonable service under ordinary conditions. Immediate and amicable adjustment will be made where Frontier Tires fail to give satisfaction.

Frontier Tires are lower than their competitors. Ask for a price list and be convinced. Also be up-to-date on tire matters by constantly asking your dealer for the latest Frontier tire-treating tips.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

ACCESSORY and GARAGE JOURNAL

SPECIALIZED MAGAZINES WITH EXCLUSIVE QUALITIES AND DISTINCT CLIENTELES

MOTOR TRUCK Is a Publication for the Business Man—a Recognized Authority on Highway Haulage. Its Readers Are Men of Affairs, Whose Buying Is Influenced by Business Reasons. They Are Buyers, and Want Facts and Dependable Information. Advertisers in Motor Truck Reach a Class That Buys and Is Buying Constantly.

AUTOMOBILE JOURNAL Is Published in the Interests of the Owners of Pleasure Motor Cars and Is Given Over Wholly to What Concerns Them. It Is Recognized by the Industry as an Owners' Magazine. Its Readers Are Buyers, Whose Influence Extends to All Motoring Enthusiasts, and Who Constitute the Market. Its Scope Is Broad and Its Quality of Contents Makes It Equally Valuable to Reader and Advertiser.

ACCESSORY and GARAGE JOURNAL Is the Only Trade Publication Devoted to the Motor Vehicle and Allied Industries. It Reaches Every Interest,—the Manufacturer, Distributor, Agent, and Dealer in Pleasure Cars and Service Wagons, Accessories, Supplies and Equipment, the Garage and Public Service Station and Repairer. It Is Read by the Buyers of All Active Concerns. It is the One Medium to Reach All Trade Interests, Without Duplication of Circulation, for One Expenditure.

YEARLY ADVERTISERS in Any One of These Magazines Are Listed Under One or More Product Classifications, in a Selected TRADE DIRECTORY That Has a Distribution in More Than 950,000 Copies Annually, That Is Revised Weekly and Appears in 48 Distinct Magazine Editions and In All Issues of the Standard Automobile Mechanical Handbooks. This Directory Reaches Those Who Are Interested and Who Buy. Its Service Cannot Be Purchased.

NATIONAL TRADE INFORMATION EXCHANGE Service Will Bring to You the Inquiries of Hundreds Who Want to Buy. This Bureau Is Conducted for the Benefit of Both Readers and Advertisers of These Magazines.
